Among the curiosities of that form of literature are the poems which treat of architecture, painting, and sculpture. They are likely to be unknown to the majority of our readers, and a few of the passages may have interest. Although the verses may not appear promising, some of the writers afterwards gained reputation. The subjects, it must be allowed, are not easy to treat. When Lord TENNYSON first appeared as a poet he made an excuse for one of his pieces by pleading the great difficulty of describing a statue in verse, and it is even more difficult to make a poem about a building.

The series of poems relating to art begins in 1806, when the subject was "A Recommendation of the Study of the Remains of Ancient Grecian and Roman Architecture, Sculpture, and Painting." The title is long enough for an epic, much less for a poem of about fifty lines. JOHN WILSON, who was afterwards known as CHRISTOPHER NORTH, was then probably the most remarkable among the Oxford students. In that year he performed his memorable jump of twenty-three feet on a level plane, and took rank as the best leaper in England. He had come up to Magdalen from Glasgow with a great reputation for intellectual ability, and his physical and mental gifts made him seem like some Greek hero who had revisited the earth. It was said of him at the time that he was endowed beyond all the youthful poets of the day, and in some powers beyond any of his contemporaries. Men were not surprised when it was found that he was the winner of the prize for English poetry. But the subject was not suited to his

genius. In his love of out-of-doors life WILSON was almost a gipsy, and indeed he lived in the tents of the tribe for a time. What could a man who was not at ease among the house-dwellers know about pictures or statues or classic buildings? He was compelled to be conventional, and lightly refer to Mrs. DAMER's pretty statues, the *Venus de Medici*, the *Apollo Belvedere*, and the *Laocoon*, and to introduce a conceit about Painting stealing the colours of the Sun and pouring them over Valour's wreath. The allusions to painting were indeed omitted when the poem was copied out, in order that there might be no more than the regulation number of lines. In conclusion WILSON introduced architecture in the following lines:—

Then turn the eye, where, spurning Time's control,  
Art stamps on stone the triumph of the soul:  
With trembling awe survey each hallow'd fane  
Ennobling Greece mid Desolation's reign;  
Each pillar'd portico and swelling dome,  
Proud o'er the prostrate majesty of Rome!  
While o'er the scene each mould'ring temple throws,  
Sacred to Genius, undisturb'd repose;  
Through twilight's doubtful gloom his eye shall trace  
The column's height enwreath'd with clust'ring grace;  
The light-arch'd roof, the portal stretching wide,  
Triumphal monuments in armed pride;  
Till bold conceptions bursting on his heart,  
His skill shall grasp the inmost soul of art;  
And Fame's green isle her cloud-capt towers display,  
Where grace and grandeur rule with equal sway.

WILSON followed the fashion of a good many other poems on architecture in thinking mostly of ruins, and possibly a building that is in use is too prosy to be worth a poet's notice. In 1810 the statue of the *Dying Gladiator* was selected for a subject, and the prize was obtained by GEORGE CHINNERY of Christ Church, who honestly acknowledges that he followed MONTFAUCON, WINKELMANN, and a French Encyclopædia in selecting the points for treatment. But the subject was afterwards treated by BYRON in "Childe Harold," and the popularity of his description gives little chance to its predecessor. BYRON makes the Gladiator a domesticated character, who, in his last moments, thought of his hut by the Danube and its inmates; CHINNERY, with more reason, supposes that he was thinking of revenge:—

His fix'd eye dwells upon the faithless blade  
As if in silent agony he pray'd,  
"Oh might I yet, by one avenging blow,  
Not shun my fate, but share it with my foe!"

The subject for 1811 was the "Parthenon," and if Mr. BURDON's prize poem is all that can be done with such a theme, it is as well that the building remained unsung for so long a time. There is so much of the inventory of an auctioneer's clerk in the following passage, it is a pity that a few touches in the GEORGE ROBINS' style have not been introduced:—

Neptune behind, in Parian stone, the earth  
Strikes; and behold a war-horse spring to birth.  
Next Pallas gives the word: from stony roots  
The branch of Peace in budding marble shoots.  
Eight fluted columns, rank'd in even file,  
In front and rear, adorn the shadowy pile:  
The channel'd triglyph, and its drooping base,  
Bespeak the new-born temple's Dorian race:  
There might you see a dread-inspiring sight,  
The Lapithæ and Centaurs wreath'd in fight:  
Those wield their giant limbs; these grasp their foe  
With sinewy arms, which branch from beasts below.  
Far sloping pillars range along each side,  
And stretch a portico sublime and wide:  
Six, at each front, retiring from the eye,  
Shun its observance, but to tempt it nigh.  
In slow procession move around the frieze  
Virgins, and Youths, and guardian Deities.  
Some stately ride, some march to measur'd sound,  
Whilst youthful champions walk their chariots round.  
Here victims pace their voluntary way,  
And bards proclaim Minerva's festal day.

It is rather amusing to find the author believing that it was Fancy painted his picture. The *Apollo Belvedere* was selected for 1812, and the prize-winner was HENRY HART MILMAN, afterwards Dean of St. Paul's. Strange to say, the student who worked himself up to a state of enthusiasm about a statue of a pagan god was unable to appreciate the work of STEVENS, which represented an English hero, and was indifferent to the

sculptor's fate. The man who in his youth heard APOLLO'S arrow hurtle in the sky and the "deathful cry" of the monster, could in his old age perpetrate an absurd joke about WELLINGTON riding in to St. Paul's on the top of his own monument.

FRANCIS HAWKINS, whose name was long associated with Oxford, was the winner in 1813, the subject being the "Pantheon." He was too sensible to pretend that he felt an awe of the work of the builder, and his taste would not allow him to count the columns or measure the dome. But he knew that his judges expected precision and tokens of having studied books rather than signs of poetic imagination. Accordingly he tried to be academic, and to produce something which, if not poetry, is an exemplification of the laws of rhetoric. One passage will suffice :—

In full proportion stands the solid fane,  
Fair as sublime, majestically plain :  
Mark the bold porch, on stately columns borne,  
Whose lofty brows light leafy wreaths adorn :  
Now stretch the view (the brazen gates expand),  
Pillars around and light pilasters stand :  
How teem the niches with celestial life,  
Where Art exults, and Nature yields the strife !  
Soft o'er the pavement blends each varied hue ;  
Light springs the dome, and circling fills the view.  
Lo ! Fancy, kindling at the sight, decries  
A mimic world, an emblem of the skies.  
Heaven's image here the Persian might adore,  
Wont on some mountain's brow his vows to pour,  
Who deems his God no narrow fanes can own,  
The world his temple, highest Heaven his throne.  
Here once in marble frown'd th' avenging Jove,  
Here stood the synod of the realms above ;  
Bright Heroes there, enshrin'd amongst the Gods ;  
Last the dread powers that rul'd the dark abodes.  
Vain phantoms !—chas'd by truth's all-piercing ray,  
Ye fled, like spectres from the face of day :  
Now through the vaulted roof Hosannas rise,  
And lift the soul in rapture to the skies.

It has been said by travellers that the Temple of Theseus at Athens is the finest ruin in Greece, and the prototype of the Parthenon. GELL considered it to be the most beautiful and best preserved monument of antiquity. The Temple formed the subject of the prize poem of 1815, and here is Mr. RICKARD'S description :—

Above the pride of Art, and boldly plain,  
In simplest grandeur stands the Dorian fane ;  
High on the strength of six fair pillars borne,  
The stately front o'erlooks the gate of morn,  
While Time's warm tints, with mellow lustre thrown,  
In dusky gold imbrown the channel'd stone.  
Fix'd on th' unrivall'd deeds Alcides wrought,  
Here Mycon's soul the flame of glory caught,  
Till breathing sculpture, spread through every part,  
Had vanquish'd Nature, and exhausted Art.  
What though the sullen tempests, as they pass,  
With envious wounds invade the perfect mass !  
'Tis but the scar that veterans joy to show,  
The pledge of conquest o'er a stubborn foe.  
Far-stretched on either side, a shapely file  
Of fluted columns lift th' incumbent pile ;  
Where once, rich-blazon'd on the bossy stone,  
In sculptur'd pomp the spoils of battle shone ;  
In friendship's cause there Theseus sped the blow  
That plung'd in death the Centaur-fiend below ;  
But these are sunk in dust ; or, dimly seen,  
Yet strive to image what the past hath been ;  
As oft at eve remains a blushing ray,  
That parting tells how glorious was the day.

This passage suggests that the author had carefully read the descriptions of the Temple. There has been some diversity of opinion about the number of columns which stood at the sides. STUART says there were thirteen, DULOU and LEROY maintain there were fourteen, while FOURMONT allows only twelve. The Oxford laureate gets over the difficulty by simply describing the columns on the flanks as a "shapely file," which may mean any number. Out of the sixty-eight metopes only eighteen appear to have been sculptured, and it has been conjectured that the remainder may have been filled with painted figures, the sculptured metopes being also coloured. There is consequently some warrant for the expression, "rich blazon'd on the bossy stone."

The descriptions of the Coliseum in "Childe Harold" and

"Manfred" could hardly fail to exercise some influence in Oxford ; and, accordingly that building was set down for the subject of the poem in 1818. But there is no trace of BYRON'S passion in Mr. OMEROD'S verses, as an extract will show :—

Here rifted arches, nodding to their fall,  
In triple circuit lift the pillar'd wall :  
Though spoil'd by rapine of their binding brass,  
Self-pois'd they hang—an uncemented mass :  
Here ruin'd piles their rugged front display—  
Commingle strife of grandeur and decay !—  
Huge corridors, where sculpture breathes no more,  
But rank weeds cluster on the mould'ring floor—  
Deep cavern'd vaults, where tuneless night-birds dwell,  
Or lurks the bandit—in the lion's cell.  
No more slow-widening with proportion'd size,  
Tier above tier, those circling seats arise ;  
Whence erst, 'mid shouting throngs, imperial pride  
Look'd down un pitying—while her children died—  
What time the white-rob'd vestal's stern command  
Bade hero ruffians lift the hireling hand :—  
Proud wreck of guilty majesty, declare  
Where now thy pomp ? thy crowding myriads where ?  
All—all is past, and o'er the crumbling stone  
Still Desolation rears her giant throne.

The poems we have mentioned treated of buildings of which a part at least was to be seen, and with the aid of imagination the temple or the arena could be reconstructed. But when in 1820 "The Temple of Diana at Ephesus" was selected the competitors were in a different position. "I have beheld the Ephesians' miracle," wrote BYRON ; "its columns strew the wilderness." Since his time something has been done towards the exploration of the place, but it is still most difficult to form an idea of the Temple. Mr. EWART is not, therefore, to be condemned because his poem is indefinite :—

Lo ! on Ionia's polish'd pillars borne,  
Its bold front hails the rosy realms of morn !  
Majestic monuments of lordly fame,  
Each the frail record of a regal name,  
Who now shall trace where Scopas' chisel taught  
The conscious stone to waken into thought ;  
Or where, instinct with life, the tints grew warm  
Beneath Apelles' touch, and melted into form ?

In the following year the subject was Pæstum, and the prizeman was the Hon. GEORGE HOWARD, who afterwards gained some reputation as Lord MORPETH and Earl of CARLISLE, a statesman and a writer of verses. A man who was a poet could have made something out of Pæstum ; but Mr. HOWARD never rose out of the commonplace. Probably all the other attempts differed little from the following :—

In solemn beauty, through the clear blue light,  
The Doric columns rear their massive height,  
Emblems of strength untam'd : yet conqu'ring Time  
Has mellow'd half the sternness of their prime,  
And bade the lichen, mid their ruins grown,  
Imbrown with darker tints the vivid stone.  
Each channel'd pillar of the fane appears  
Unspoil'd, yet soften'd, by consuming years ;  
So calmly awful, so serenely fair,  
The gazer's heart still mutely worships there.

Mr. HOWARD'S poem is probably better known than most others of its class, for it has been introduced into MURRAY'S Guide for the benefit of travellers who have the courage to visit Pæstum. Whatever may now be thought of the prize poems, it is evident that the authorities of Oxford were of opinion that architecture produced better exercises than other themes. In no other way can we account for the adoption of architectural subjects for so many years in succession. Mr. AMBROSE BARBER won the prize for 1822. He addressed "Palmyra" in the following style :—

O'er the hush'd plain where sullen horror broods,  
And darkest frown the Syrian solitudes,  
Where Morn's soft steps no balmy fragrance leave,  
And parch'd and dewless is the couch of Eve,  
Thy form, pale City of the waste, appears  
Like some faint vision of departed years.  
In mazy cluster still, a giant train,  
Thy sculptur'd fabrics whiten on the plain ;  
Still stretch thy column'd vistas far away  
The shadow'd dimness of their long array.

Mr. RUSKIN once advised architects to think in shadow, and the Oxford poets anticipated him in adopting if not in

formulating the maxim. One man thinks of the shadows in the Eastern desert, and another of those on Salisbury Plain. Mr. SALMON in describing "Stonehenge" wrote:—

Wrapt in the veil of time's unbroken gloom,  
Obscure as death, and silent as the tomb,  
Where cold oblivion holds her dusky reign,  
Frowns the dark pile on Sarum's lonely plain.  
Yet think not here with classic eye to trace  
Corinthian beauty, or Ionian grace:  
No pillar'd lines with sculptur'd foliage crown'd,  
No fluted remnants deck the hallow'd ground;  
Firm, as implanted by some Titan's might,  
Each rugged stone uprears its giant height,  
Whence the pois'd fragment tottering seems to throw  
A trembling shadow on the plain below.

The "Arch of Titus," which was selected for the poem for 1824, was a less extensive subject, and the prize was carried off by Mr. JOHN THOMAS HOPE. In this case there is a nearer approach to realism in the description of the arch:—

With mingling beauties crowned, the columns tower,  
Ionia's graceful curve, and Corinth's flower;  
And tapering as they rise aloft in air,  
The sculptur'd frieze and votive tablet bear.  
From o'er each column Fame exulting springs,  
Seems stretch'd for flight, and waves her golden wings:  
Yet linger not! within the circling space  
The storeyed walls more radiant beauties grace;  
In warlike pomp the triumph's rich array  
Leaps from the living marble into day.  
High on his car the victor borne along  
Hears with exulting heart th' applauding throng;  
With sparkling eye surveys the sacred spoil,  
And feels one hour o'erpay long years of toil.  
Lo! Judah's swarthy sons before the car,  
The wither'd remnant of disease and war!  
Rebellious passions light their faded cheek,  
And all the bitter pangs they dare not speak.

It is difficult to say in looking at the Temple of Vesta at Tivoli which is more deserving of admiration, the building or the site. This may explain the short description which is given of the Temple itself by Mr. SEWELL:—

And lo! where still ten circling columns rise  
High o'er the arching spray's prismatic dyes,  
Touch'd, but not marr'd—as Time had paused to spare  
The wreaths that bloom in lingering beauty there—  
E'en where each prostrate wreck might seem to mourn  
Her rifted shaft, her lov'd acanthus torn,  
Nature's wild flowers in silent sorrow wave  
Their votive sweets o'er Art's neglected grave.

"Trajan's Pillar" was adopted in 1826, and it was followed by "Pompeii." Mr. HAWKER's prize poem is of unusual length, but we must restrict our selection to one passage:—

But see! once more beneath the smiles of day,  
The dreary mist of ages melts away!  
Again Pompeii, 'mid the brightening gloom,  
Comes forth in beauty from her lonely tomb.  
Lovely in ruin—graceful in decay,  
The silent City rears her walls of grey:  
The clasping ivy hangs her faithful shade,  
As if to hide the wreck that Time had made;  
The shatter'd column on the lonely ground,  
Is glittering still, with fresh acanthus crown'd;  
And where her Parian rival moulders near,  
The drooping lily pours her softest tear!  
How sadly sweet with pensive step to roam  
Amid the ruin'd wall, the tottering dome!  
The path just worn by human feet is here;  
Their echoes almost reach the listening ear:  
The marble hall with rich Mosaic drest;  
The portal wide that woos the lingering guest:  
Altars, with fresh and living chaplets crown'd,  
From those wild flowers that spring fantastic round,  
Th' unfinished painting, and the pallet nigh,  
Whose added hues must fairer charms supply:  
These mingle here, until th' unconscious feet  
Roam on, intent some gathering crowd to meet;  
And cheated Fancy, in her dreary mood,  
Will half forget that all is solitude!

With the exception of "Stonehenge," all the subjects are Classic buildings, and when a painting was suggested it was *The Iphigenia* of TIMANTHES. The reason is that between 1806 and 1826 Oxford paid little attention to anything that was not described in Greek or Latin books. Nevertheless,

some acknowledgment is due to the men who at that time had sufficient esteem for architecture as to suggest that it was adapted to inspire the young poets of the University.

## STUDIES OF LONDON CHURCHES.

[BY A CORRESPONDENT.]

FROM time to time notes on London churches have been published in *The Architect*, one instalment ending in August 1883. The writer now proposes to complete his studies, which he trusts may be found useful to students, as they describe the most noteworthy churches in the metropolis. His endeavour has been to be impartial in his criticism, whatever may be the style, and he has spared no pains to attain accuracy.

The fine church of *St. John the Evangelist*, Hammersmith, the work of Mr. Butterfield, has been alluded to in these columns previously, so only a few points connected with the more recent additions to it need be mentioned. There is a considerable amount of colouring to the nave-aisle walls and to the roof. The stone columns are also painted red, but not so the stone arches. This does not have a good effect. The majestic oak chancel screen consists of five panels, each arched and cinquefoil cusped, the central one being wider than the rest and gabled, with tracery over it, consisting of a circle quatrefoil cusped, and two larger circles under cinquefoil cusped, the whole richly moulded. Instead of the cross, the pelican in her piety is represented, a not very usual feature in modern churches, though not uncommon in the chancel screens of the time of Wren and his school. It will probably be long before this ancient symbol of our Saviour is disused, notwithstanding that the beautiful legend of the mode in which the pelican nourishes her young has been disproved as not being in accordance with natural facts, like many other beliefs which we had in the days of our childhood. For example, though the cross of suffering, as generally represented, has long been known as not of the historical form, yet the conventional shape so familiar to us is still loved and retained, and its appropriateness felt. The screen, having been added subsequently to the erection of the church, partly hides a small portion of the respond to the chancel arch. The various parts are perhaps rather large in scale, and the treatment somewhat too much resembling that of stone. Nevertheless it is a fine composition, and to those who remember the church before the screen was added it is surprising what an improvement it has made, even though the want was not before so apparent. The muntins carrying the central arch are of good width, but in this position do not, of course, injuriously intercept the view eastwards; a shaft and respond shaft carry the cusped arches. It is rather unusual to find columns in this position, but in a parclose screen to Northfleet Church of thirteenth century date an example occurs. The oak to the screen at St. John's Church is stained one or two different shades, the columns being the darkest. But surely it would have been better to have left all the oak its natural colour, clean from the tool, to darken and mellow in time! In all the Mediæval wood screens (in England at any rate) the cornice runs through from end to end without break, but Mr. Butterfield has here, with his accustomed boldness, taken a "new departure." At the end of the screen and to the central muntins occur small buttresses with gabled tops. The upper part of the composition is treated in a rather unusual way, as there is a long panel with a series of quatrefoils under the cornice. The latter has a peculiar ornament at its summit, a series of small panelled squares springing out of a splay. This has almost the effect of an embattlement. Turning from the screen, the fine clerestory of the nave is more effective internally than externally, as there is only a single chamfered order outside. To the chancel is a three-light east window, but no side windows. This is to be regretted, as a side light, however small (particularly on the south), is always very desirable. The tower, with saddle-back roof, lately added to the church, is simple and severe, almost to a fault, standing nearly detached. One of the bells is rung from the porch, which forms the ground storey of the tower.

*St. Augustine's*, Bermondsey (why are nearly all the churches of that dedication in London, of which there are about seven, so good in design, though the composition of different architects?) is a clever specimen of a modern town church, and no mean reproduction of a Mediæval building. It sets forth a faithful following out of the grand principles of Mediæval art, principles shadowed over for a season, like an April sun, with showery clouds, but ready to shine forth brighter than ever after their temporary eclipse. The only point in which a little weakness occurs is the detail of the mouldings, which is not equal to the general composition. Though the chancel roof externally is higher than the nave, this is not so internally, as the chancel is vaulted, the nave having a panelled wood ceiling. No attempt has been made to vainly conceal the tie-rods to the groining (which is highly domical in character) by decorating them in colour or other ornamentation. There they are, naked and unadorned, cutting into

the brick vaulting. Viewed internally, the east end of the chancel is a fine composition, and displays a large amount of patient and original study. As the chancel is of considerable width, the east wall does not appear crowded, notwithstanding the triplet window in the centre, with couplets at the sides. Yet this is practically equivalent to seven lights, without any appearance being given of a wall of glass, the piers being of amply sufficient and substantial character. There is one cardinal virtue in the church—perhaps almost a necessity where the span of the roof is much greater than the average—*i.e.*, the thickness of the walls. If the student were to examine the interior first, he would think the walls were thicker than they really are, for externally there is a very shallow reveal up to the glass line. Greater importance has evidently been attached to the interior than to the exterior, and very properly so. The inside treatment of the windows to the nave aisles is ingenious, and at first sight rather puzzling. They are couplets, but have three rear arches, of an order quite distinct and separate from those outside. They are almost more ornamented than the chancel or clerestory windows, which is scarcely desirable. These two distinct planes of tracery, only possible in a thick wall, are an enormous gain to the interior of a church, and it is greatly to be regretted that want of funds prevents so beautiful a feature being more often employed. Some braces in the nave ceiling cut into it longitudinally in a rather awkward manner, though this was doubtless necessary for constructional reasons. In the chancel (of three bays) is a rather unusual feature—a large plain surface of wall, designed with a view to future decoration, between the top of the arches opening out into the aisles and the clerestory windows. Such a treatment is not at all uncommon in the churches of Italy—as at Rome and Ravenna—but not often accepted in England. The responds of the archways on the north and south of the chancel possess no capitals or abaci, but only base mouldings, and look scarcely rich enough for the situation. The chancel aisles are on the same level as the nave. Should it happen by any misfortune that pew-rents are ever established in this church, it will be absolutely necessary to raise the level of the pews here, otherwise they will never “let.” Such is the experience of the writer in a large church he designed, where the chancel aisles were raised 6 inches above the nave, and were about 12 inches below the chancel floor line. At the east end of the chancel three arches open out into an aisle, the side aisles being “returned.” There are several advantages in this plan, among which is that the east end never looks bare if without a reredos. Where a rich reredos exists, as is the case at St. Augustine’s, Kilburn, the effect is very good with this aisle in the eastern background. This aisle is at present made use of as a vestry, but preparations for a more permanent vestry at a future time have been made on the north side of the chancel. The nave clerestory windows appear rather like dormers externally, and project slightly. The organ chamber resembles a first floor to a transept, opening out of the chancel, with a little balcony of shallow projection where the organist sits. Beneath it is the chancel aisle, which of course has a flat ceiling, being under the organ gallery. Instead of principals to this ceiling there is a traceried arch subdivided into two smaller arches, which help to support the gallery. Externally a turret is cleverly arranged to break the wall line. In fact, all round the organ chamber blank spaces of wall are well diversified without recourse to any windows, which would be of no use and undesirable in this case. The whole of the floors, both of the passages and under the seats, are of Portland cement. The seats are of deal ebonised, and look well when the funds will not allow of oak benches. The east end of the church is not much seen, owing to adjoining houses, but is striking in appearance, with boldly-projecting buttresses. Since the writer examined this interesting church the remaining western bays of the nave have been added and the permanent west front, which may possibly be commented upon some other time.

The *Church of the Holy Innocents*, Hornsey, is a good specimen of a village church, though the great metropolis is creeping up to it, and the increase of population in this neighbourhood is its *raison d’être*. It is built principally of stock bricks, with red brick arches and bands. No plastering is used externally, as the walls are only pointed. The chancel is a little higher than the nave, but too short to look well either externally or internally. The tower is placed on the south side of the east end, its ground storey forming the organ chamber. There is no regular clerestory, as the nave is not of sufficient height for such a feature; light at a high level is admitted by a large dormer window—an economical plan, saving walling, but, except for a village church, not sufficiently dignified. The nave arcade is in four bays, with a plain space of wall at the west end, pierced by a small archway. The latter well helps to mark the spare space or passage behind the seats. The nave roof is open-timbered, having trusses with tie-beams and king-posts. There are likewise intermediate trusses, without tie-beams. It seems of rather too plain design for ecclesiastical architecture. The reveals to the windows and the nave arcades are all of brick, square-edged. The aisles, one only of which is permanent, will be about eleven feet wide, with lean-to roofs. The tower is very plain, without buttresses, the only projection being a

stair-turret. Though there has been no opportunity in this church of much display in originality, owing to limited funds, yet it has the merit of being a good, honest, straightforward building, worthy of its eminent architect, Mr. Blomfield.

*Holy Trinity*, Dalston Junction, was finished in 1879, and the same remark applies to it as to several of the churches previously commented upon. It is a good type of that style of brick building, with stone sparingly introduced, which has sprung up within the last twenty years. The plan comprises a nave of considerable span, and rather narrow windowless aisles about eight feet wide. The proximity of other buildings prevents any side-light being obtained here except from the clerestory. As occurs in several London churches, the principal access is at the east end, which necessitates a porch and vestibule on the north side of the chancel. This is always a somewhat inconvenient arrangement, as every one coming into the church has to face the congregation already assembled. There are north and south aisles to the chancel, roofed transept-wise, the southern one forming the vestry, with the organ-chamber above it. The northernmost aisle becomes a vestibule, with a church-room over. The greater portion of the chancel is under the tower, which is not square in plan. It is roofed with a span roof hipped at each end, and consequently has a piece of straight ridge. On the long side of the tower are three windows, on the short side two. Where the design, like this, is unpretending, with a simple brick corbel course and no parapet, this type does very well, and has the advantage of saving expense, by utilising the ground storey of the tower. For if the latter is to be necessarily square it will often cause difficulties. The lower part is groined in brick, the eastern portion of the chancel, not under the tower, being barrel-vaulted in the same material. One of the disadvantages of the choir being placed in this situation ought not to be forgotten—the room which the projection of the piers, necessary to carry a tower, occupies. In the present example, owing to this, the men in the back row of the choir seats can scarcely be seen. Were this not so, part of the width of the chancel would be wasted if the seats had been advanced. There is no pulpit, but a brass desk is placed facing west on a low stone chancel screen wall. The glazing of the east window is more elaborate than that in the rest of the church, all of cathedral rolled glass. Its composition mainly consists of circles. The nave has an open-timbered polygonal “trussed rafter” roof, with king-post and tie-beam trusses. As all the timbers are of stout scantling (a virtue which Mr. Christian, the architect of the church, always affects) the roof has a good appearance. Over each bay of the nave arcade are two clerestory windows, each set in a brick arch recessed 4½ inches, the brick piers dividing them being square in plan. The spandrels over the nave arches are enriched with circular panels of diapered brick, the effect of which is pleasing. The capitals are particularly good with square abaci and a species of simple carefully-studied carving, Transition-Norman in feeling. The piers are of a greyish stone and rest on rather high pedestal bases, the latter, in the writer’s humble opinion, being always a mistake. The seats to the body of the church are remarkably plain and of skeleton framing.

*St. James’s*, Peckham, the design of Mr. Blomfield, is built of stock bricks, with red bands. The plan is a nave, with lean-to aisles; a north and south porch towards the westernmost end of the nave; north and south chancel aisles with gables at right angles to the chancel, and lean-to aisles on each side of the latter, the north of which forms the clergy vestry, the south one a porch. The north chancel aisle is devoted to the choir and to the organ. The church is, therefore, exactly symmetrical in plan, an unusual thing in a Gothic building. To the nave aisles a feature occurs of which Mr. Blomfield is rather fond, a couple of gables or large dormers, with three-light windows. There is no tower, but a west gable turret, with three openings for bells, the whole very picturesquely treated. But beneath the thicker part of the wall, under the turret, is a two-light window. Now, is it desirable to thicken out a wall in such a situation so as to strengthen it, and then weaken it by inserting a window? There is precedent in Mediaeval examples, as at Manton Church, Rutland, but that does not necessarily prove its virtue. The nave arches are of ordinary brick, plastered over, not pointed, and this gives a common appearance for the present, but the obvious intention is to apply colour decoration, for which plaster is the best vehicle. The roof to the nave is a tie-beam one, with two intermediate hammer-beam trusses in each bay. The church is plainly treated with square brick reveals, and chamfers are infrequent.

*St. Dunstan’s*, East Acton, is another brick church, but the bricks are red, and there are stone dressings internally. In plan the building is rather different to some of the churches just described, as it has a nave and chancel, no clerestory, and a wide span roof aisle on either side. Abundance of light is afforded by large three-light windows to the aisles, but at the period when the writer inspected the church, very shortly after its being consecrated, none of the aisle windows were made to open, and the admission of fresh air was only obtained by a couple of gratings,

14 inches by 9 inches, placed under each window, communicating with air-flues which discharged on the top of the flat eills, the latter being easily accessible. The tower is on the south side, with a spire of red brick relieved by a few stone bands. The spire looks picturesque through the trees as the traveller approaches it from Bedford Park. The organ (which has a rather fantastic case) is placed at the west end of the nave in a gallery. The westernmost respond of the nave arcade stops short of the west wall to give some plain wall space. Under the organ gallery is an ornamental glazed screen dividing off a vestibule, west of which is a lean-to porch with entrances at its north and south ends. What a mistake is such a retrograde step, the placing the organ in this situation! Another "harking-back" to obsolete practices is making the nave seats some 8 or 9 inches higher than is usual, and with doors. The roofs are of trussed-rafter construction, with cross-braces and collars, boarded at the back of the rafters, braces, and collars, a small chamfered fillet being fixed on each side of the rafters to give them greater apparent width. The effect is good, and cannot be called a sham. In utility it is a compromise between an open roof and a panelled ceiling, as a neutral space of air lies above the collars and braces. But just where the boarding occurs at the back of the rafters, this advantage is of course lost. There are contrivances in the ceiling for the emission of vitiated air at the level of the collar beams. The flat inner sills of the windows previously mentioned are of chamfered brick; stone would have looked much better in such a situation, and its extra cost amounted to very little.

The parish church of *St. Mary*, Ealing, originally built in 1735, was cleverly re-cast by the late Mr. S. S. Teulon several years since. The material he had to work on was singularly unpromising, for at the period when the church was erected ecclesiastical architecture was at a very low ebb. Not much of the original building, however, remains. The broad aisleless nave has now much the appearance of possessing aisles. The iron pillars which help to support the galleries, carry ornamental wood arcading. The true aisles are the ambulatories or side passages, of low height and no more width than is sufficient for their purpose. The buttresses are carried on solid arches and walls over the aisles, so that the rather expensive mode of lead flashings to the side of each buttress became a necessity. Moreover, any such point is more particularly vulnerable to wet and frost, and it is a great object in this church to avoid such places as far as possible. The vestibule at the west end of the building is large and elaborate, and is virtually a lean-to aisle. The way in which the stair-turrets to the galleries are contrived, and the whole composition of the west façade is clever, and has an imposing general effect, though there are some matters of detail which might fairly be criticised. The pulpit is of considerable height in order to command the galleries, and necessarily has a long staircase up to it (with elaborate wood balustrading). Perhaps the architect was well advised here; whereas a low pulpit had best have the steps small and inconspicuous, with no handrail or balustrade. Speaking of the latter it may be mentioned that at the church of *St. Mary-at-Hill*, Eastcheap, the staircase up to the pulpit is really a pretty feature, an exceptional thing. The details are of the Wrenian type, though the pulpit was erected during the present century.

(To be continued.)

#### JAPANESE ENAMELS.\*

THE art of enamelling combines chemical science with metal work, and is one of the noblest and oldest of crafts. When or where it originated is unknown. As soon as men could make ornaments with gold or silver wire, or with narrow bands of metal, it would be only a step further to attempt the filling of the open spaces with a coloured material, and accident if not design might lead to the filling of the cavities on the reverse side of a piece of repoussé metal work. One thing is certain, that the craft has been practised in India, and especially in Rajputana, from time immemorial, and it is only by keeping in view the characteristics of Indian art that we are able to comprehend the idea which is still revealed by the best kinds of enamelling. India is the land wherein pierced work and repoussé work prevailed, and enamelling is but an accompaniment to them. The art was at a very early age introduced into China, and at a much later time it was known in the West. The Greeks knew how to employ fused colours. That the art was not confined to one place is seen by the statement in a Roman book of the third century, that the barbarians who lived near the ocean ornamented the trappings of their horses with enamels. It is remarkable that examples of the earliest Anglo-Saxon ornaments in the Ashmolean Museum are adorned with what appears to be enamel, although some of the divisions may be filled with coloured stones or pastes like the Egyptian jewellery. Byzantium appears to have been a seat of the industry from the fourth to the eleventh century, and in conse-

quence it was at one time supposed that enamelling had been derived from Mosaic work. In that valuable cyclopædia of early European art, by the monk Theophilus, there is a most interesting description of enamelling as applied to the decoration of an altar vessel. The bands, he said, were to be formed of very fine gold, and so bent to the form of the ornament that was desired. The spaces were to be filled, one after another, with an enamel which had been carefully prepared and then soldered. The precision of the instructions shows how well cloisonné work was understood in the eleventh century in the East of Europe.

The Japanese have derived their knowledge of cloisonné enamelling from the Chinese, but at what time, the art was introduced has not been recorded. The earliest examples are marked by the use of deep red and blue. In later examples the colours are lighter, and the partitions follow more perfect curves. Mr. Bowes, in the interesting essay on "Japanese Enamels," says there are three clearly marked classes, which he terms Early, Middle period, and Modern. The foundation of the cloisonné in the Early and Middle periods is excessively thin metal, sometimes one-sixteenth of an inch thick, and in this respect the work differs from the Chinese. But we have not to go back for the best examples of the art. The choicest works in lacquer were made in the period between 1688 and 1704, and according to Mr. Bowes, "it is not unlikely, therefore, that the last century was the most brilliant period of Japanese art, and it may be correct to assume that the choicest examples of cloisonné enamelling belong to that period."

The rules which determine the forms of the largest works in iron are no less applicable in the case of the minutest cloisonné partitions. Metal if flexible is also rigid, and one quality is as much worthy of recognition as the other. In the best Japanese examples we therefore find a great number of straight lines in the form of geometrical diapers, frets, radii forming petals, and so on. A contrast with them is formed by figures of native birds, flowers, trees, and fishes. The human figure is rarely found on old enamels, and Mr. Bowes says he has met with only three examples. As in other descriptions of Japanese work, the forms are not always graceful, and it must be owned that they are often ugly. The paste was found on analysis to consist of about 52 parts of silica, 37 of oxide of lead, 5 of soda, and 5 of lime. It is coloured by the addition of metallic oxides; cobalt is added for blue, iron for grey, yellow and pink; iron and copper for black, and bone earth for white. The old paste has more depth and softness than the modern. Generally every compartment consists of paste of one colour, but "sometimes a single space will contain two or more colours, and it seems as if the pastes had been of a sufficient consistency to prevent any general mixing of the colours, although they blend a little at the place where they meet."

It is remarkable that in Western Europe little attention was given to Japanese enamels until quite lately, and the examples in the international exhibitions were of modern work. Mr. Bowes believes that he possesses two-thirds of the old ware which has reached Europe since 1872. Enamelling seems to have been a sort of privileged art which only the highest classes were able to possess, either in their palaces or special temples. It is not even mentioned by such travellers as Koempfer and Siebold. The modern enamel of Japan is not equal to the work of the last century, and specimens are to be had at so low a price that it is difficult to understand how they have been produced. Mr. Bowes is the happy possessor of nearly two hundred examples of old work, and in the volume which he has produced he gives descriptions of them, with photographic or chromo-lithographic illustrations of several of the best works. The book is a worthy companion to the splendid volumes which bear Mr. Bowes's name.

#### VANDALISM IN COVENTRY.

AT the meeting of the Poor Law Guardians of the Coventry Union on the 3rd inst., Mr. Goate called attention to an act of vandalism which had been committed upon the Guardians' property in Little Park Street, where the vaccination station was now being rebuilt, in the destruction of a very fine crypt. All thinking men were unanimous in a desire to preserve such monuments and memorials of the past, especially when they illustrated different periods of architecture, and he feared that the destruction of this crypt would cause the perpetrators of it to be held up to scorn for many years to come. Having offices very near to the spot, he had heard expressions of opinion from numerous people, who concurred in condemning the act, the general feeling being that such wanton destruction should not have been allowed. He was quite sure the General Works Committee could not have been fully aware of what was about to be done. Underneath that property was one of the finest ancient crypts in Coventry, having a solid groined roof which was capable of supporting any amount of pressure, but for some reason or other every stone of it had been removed, except the side walls. Surely no effort should have been spared to preserve such a valuable archaeological treasure. If the arch had not been sufficiently strong to bear the weight of the new building, supports might have been built under it, as was done in the case of the Coventry and Warwickshire Bank, where the original vaulting was preserved intact. He wished to know what

\* *Japanese Enamels*. By J. L. Bowes, Liverpool. Printed for private circulation.

reason the General Works Committee had to give for the course that had been adopted.

The Chairman of the General Works Committee in reply said the contractor called his attention to the desirableness of retaining this roof, and said the foundation could be built in such a manner as to leave it intact. The General Works Committee held a meeting on the ground, and asked their architect (Mr. Whitley) if such a thing could be done. Mr. Whitley replied that he would not be answerable for the building if such a thing were done, and that was the reason why such a work of destruction as mentioned by Mr. Goate had been permitted.

Mr. Beamish supported Mr. Goate's remarks, and said he believed he was stating a positive fact when he said that not a single member of the committee believed that the fine piece of architecture would be destroyed as it had been. He had spoken to a practical man who was on the spot the previous day, and he said if it had been possible to put St. Michael's Church on those arches, which were the finest he had ever seen, they would have borne it. He (Mr. Beamish) contended there was not the slightest necessity for that work of destruction. There was matter there extremely interesting, not only to Coventry, but to people outside, and the work that had been done ought not to have been done until the last moment when everything else had failed. As the architecture had been pulled down, some of the guardians were on the ground on the previous day and saw stones extremely interesting and handsomely carved. They gave instructions to the builders to remove them to St. Mary's Hall, so as to preserve them for the benefit of archaeologists and others interested in the work. Such an act of wanton destruction, he said, was only worthy of the barbarous ages, and he thought greater respect ought to have been paid to such a handsome crypt. He disapproved of the whole business, as did also the General Works Committee on the ground.

Mr. Haywood endorsed the remarks of previous speakers, and expressed his sorrow that the surveyor should have given such a decision; but, if they employed a surveyor, they must abide by his decisions.

Mr. Snape said it was the last of his thoughts that this ancient cellar should have been destroyed.

The Chairman said he could only regret that such a piece of work had been destroyed, but if it was the opinion of the surveyor that the building would have been unsafe they must abide by it. They all would regret the destruction of such a beautiful piece of workmanship, and wished it could have been arranged otherwise.

Mr. Whitley having been called upon, said he might point out with regard to this cellar roof, that in his first plans he so prepared them that the ceiling would have been preserved entire, but the General Works Committee told him to throw away his antiquarian notions and old fageisms, and to make a clean job of it. Again, as the ceiling would be subdivided into four or five parts, its original dimensions would be lost, and he could not see then where its beauty would be. As planned, the cellar, he was told, would be of very little use to the occupants of the house, and the plans were overruled. That was all he could say about the matter. The committee ordered it.

The Chairman said he thought there must have been a mistake somewhere. We cannot help it now; the mischief has been done.

Mr. Lloyd said it was quite true, and he thought it should be stated that in the plans first prepared by Mr. Whitley he particularly desired that the cellar should be kept intact.

Mr. Newsome said he could quite bear out Mr. Whitley in his remarks as to his wanting to preserve the arches of the cellars. Mr. Whitley had told him that he was anxious they should be preserved, but somehow the committee did not seem to fall in with the idea, so that under the circumstances he thought they must exonerate Mr. Whitley from blame.

Mr. Booth: And blame the committee.

Mr. Beamish said the committee must be exonerated from all blame, as they were on the ground, and expressed a desire to preserve these cellars, and asked Mr. Whitley to preserve them.

The Chairman: If Mr. Whitley was instructed to do away with antiquarianism what was he to do? The only thing to be done now was to express deep regret that such an act of destruction had been committed.

After some further discussion,

Mr. Beamish said he had arranged with the contractor to remove several of the stones to St. Mary's Hall, and would himself bear the expense of their removal.

#### A SHAKESPEREAN VILLAGE.

A FANCY fair and bazaar has been opened in the Town Hall, Birmingham, with the object of obtaining funds to build schools, according to designs by Messrs. Ingall & Hughes, in connection with the Westminster Road Congregational Church. The principal feature is what is called a Shakesperean village, designed by Mr. G. H. Bernasconi, but which in reality consists of a grouping of architectural objects associated with or contemporary with the life of the poet, though not actually found in such close topo-

graphical connection as that in which they are represented at the Town Hall. The *Birmingham Post* says the combination is one exceedingly well adapted to the methods of scenic decoration for which Mr. Bernasconi has become famous, and the result is highly realistic and effective. On the orchestra has been built up a representation of a portion of Warwick Castle. The general effect of this, as viewed from the floor of the hall, is imposing, while the architectural details are tolerably correct, and the appearance of the weathered masonry has been beautifully and accurately counterfeited. Some slight departures from the original have been rendered necessary by the conformation of the orchestra; but, on the other hand, the gradations of the substructure have been turned to good account in producing the effect of a massive pile of buildings, with terraces and walks which in theatrical language are described as "practicable." It is intended that each evening the lady stall-keepers, who will be dressed to represent characters from Shakespeare's plays, shall issue in procession from the large gateway in the background, and, after winding about among the turrets and battlements of the castle, descend by a zigzag path along the mimic terraces to the floor of the hall, round which they will pass, and then file off to their respective stalls. The stalls or shops—for their situation suggests the latter designation as the more suitable—are in the lower portions of what appear to be specimens of the domestic architecture of Warwickshire in the Tudor period. On the left, looking from the orchestra, the middle stall represents Shakespeare's house at Stratford-on-Avon, as it appeared before its restoration, and the two stalls flanking it are presentments of other old houses in the same street. Facing "Shakespeare's house" is "Ann Hathaway's cottage," on either side of which are representations of other old Warwickshire tenements. The great gallery is hidden by a view of Stratford-on-Avon Church. Under the great gallery is the refreshment stall, with a frontage in harmony with the other decorations, and exhibiting the sign of "The Shakespeare Inn." Facing this a stall for miscellaneous articles occupies a recess in the castle wall, while in the centre of the room a structure representing an ancient village market house forms the flower stall.

#### THE BRADFORD TOWN HALL.

A MEETING of the Bradford Town Council was held on Tuesday, when Alderman Hill moved a resolution that all necessary steps be taken for enlarging and extending the present municipal buildings for the better transaction of the public business of the town; that the subject of designs for the proposed extension be submitted to competition; and that as soon as possession is obtained of the requisite land, a new street be formed from Chapel Lane to Nelson Street. He said that as to the question of extending the municipal offices, the proposal was unanimously agreed to at a meeting of the Finance Committee. When the present municipal offices were built, the population of Bradford was 146,000, and at the middle of last year the Registrar-General estimated the population (inclusive of the recently-extended portion of the borough) at 204,000, so that from the time of the building of the town hall to the present time there had been an addition of one-third to the population of the borough. Although the town hall had cost a deal of money, there was not the accommodation which there ought to be for the outlay. At present many of their officers had to perform their duties in very small rooms, and, as an instance, their medical officer of health occupied a room which was only like a small cellar kitchen. The accommodation for the rate-collecting department was not adequate for the business of a town of even 20,000 inhabitants. He might say, further, that the work of the School Board had increased so largely that it would soon be necessary for new offices to be provided for that body, and the ratepayers would have to find the money for that. But the School Board could not erect offices without perhaps spending more money than it would cost to provide the requisite accommodation in the municipal buildings. It was also urgent that the land on the south side of Chapel Lane should be utilised, as now that there were tram-cars running in Manchester Road, it was necessary to make the new street from Chapel Lane to Nelson Street, so as to relieve the traffic in Manchester Road. On these grounds he hoped the council would adopt the resolution.

Alderman Moulson moved an amendment to omit that portion of the resolution relative to submitting the designs to competition, and to appoint Messrs. W. & R. Mawson as architects for the extension. He said that it would be unbecoming of the council, and an insult to the firm of architects who designed the town hall, to seek plans elsewhere. Messrs. Mawson had already prepared plans for the extension; these were all that could be desired, and provided for splendid offices, as well as a subsidiary court and a coroner's court.

After some discussion, the amendment was carried.

Alderman Hill, replying to questions, said the estimated cost of the extension was 30,000*l.*; the cost of the land was 32,000*l.*, but of this there would be 1,100 yards for sale, which would be worth 11,000*l.*; and from the land there would also be taken sufficient for a street 20 yards in width.

## NOTES AND COMMENTS.

It is surprising how many reforms are suggested in an English daily newspaper in the course of an autumn, and what opportunities are then available for correspondents to display their wisdom. Among other subjects, the *Times* has taken up the evils of restoration. This time the architects are discovered to be malefactors, because occasionally a memorial which records the death of a man or a woman has been removed. To read the articles and letters in the *Times*, it would appear that all the people who die in England are celebrities, and that every slab which bears a name deserves to be preserved. The clergy during many years have been in the habit of urging architects to go as far as funds will admit in restorations, but when an outcry has been raised they leave architects to bear all the responsibility. It is therefore gratifying to find that one vicar has the courage to write against the indiscriminate preservation of monuments in churches, and to express his determination to clear away with an unsparing hand the tablets which belong to a vicious and ignorant age. It is needless to say that the vicar has been rebuked by the *Times*. "Was it after all," it asks, "so vicious and so ignorant that even its memorials cannot be tolerated by its virtuous and well-informed descendants?" But why should the present age tolerate things which are simply records on stone of the vanity of the BROWNES, JONESSES, and ROBINSONS of the past? Those people were, if we believe the inscriptions, paragons of all the virtues, but that is no reason why a church should be degraded by preserving the records of their goodness. Let their descendants and admirers collect the tablets and make a museum of them; but as the majority of men are fated to be forgotten, it is not the office of a church to oppose the inevitable.

THIS year the number of works forwarded to South Kensington for examination from the 201 art schools of the United Kingdom amounted to 255,365. From them the examiners selected 1,410 to enter into the national competition. Birmingham has obtained sixteen medals; Lambeth, fourteen; Glasgow, thirteen; and South Kensington, ten. The low position generally held by the last in the national competitions is becoming remarkable. The examiners were:—Messrs. E. J. POYNTER, R.A.; GEORGE LESLIE, R.A.; W. F. YEAMES, R.A.; J. E. BOEHM, R.A.; H. S. MARKS, R.A.; HAMO THORNYCROFT, A.R.A.; GEORGE AITCHISON, A.R.A.; WILLIAM MORRIS, WALTER CRANE, J. J. STEVENSON, Professor W. C. UNWIN, ALLAN S. COLE, T. ARMSTRONG, Director for Art; and H. A. BOWLER, Assistant-Director for Art.

THE Metropolitan Public Garden, Boulevard, and Playground Association, of which Lord BRABAZON, an Irish peer, is chairman, has, during the three years of its existence, accomplished a large amount of useful work in London. If it did nothing else, it would be entitled to gratitude for having improved a few of the disused London churchyards. St. John's, Hoxton, and St. Mary's, Haggerston, have been transformed, and the example has been followed elsewhere. The association has obtained leases of the garden of Ebury Square, Canonbury Square, and of one-half of the site of Horsemonger Gaol. It has planted trees and placed seats in several thoroughfares, and has aided in the erection of gymnasia. Although London has so many philanthropic societies, there is room for one of this character which will help in beautifying some of the neglected land in London. It is not within the functions of the local authorities to undertake work of the kind, and still less is it adapted to individuals. The wiser way is for a society to become improvers, and one better managed than Lord BRABAZON's is not readily discovered.

THE vestry of St. James and St. John, Clerkenwell, is up in arms to defend itself against the aspersions of the President of the Local Government Board. If we may judge by the report of the medical officer of health, the parish is a marvellously healthy place. The rate of mortality has been during last year 16.9, while the average for London was 20.4, for the central districts 23.2, and for the east districts 24.1. It is remarkable how often officers of health are able to arrive at similar results. Sir CHARLES DILKE said "that there were fourteen house farmers in the vestry and twelve publicans, who seemed to work very much with them, and that state of things had undoubtedly led to insufficient care being taken by the vestry

of the condition of the parish." The medical officer, on the other hand, denies that these "have ever exerted an interference with the sanitary proceedings of the parish." There is, consequently, a body of twenty-six much maligned sanitary reformers in Clerkenwell. One of the proofs which are given of the zeal of the vestry is rather curious. The medical officer asks, "Does not the building of a beautiful mortuary—one of, if not the best in London—at a cost of nearly 3,000*l.*, and which is of sole use for the poor, show that the vestry are not governed by such so-called 'house-farmers and publicans' as are stated to have no feeling for the poor?" The mortuary is so beautiful a place, it has been known that a corpse was kept there for fifteen days.

AN architectural assessor is of little use apparently unless his recommendations are adopted. Yet it has happened in some recent competitions that the reports have been set aside. One of the latest is the Leeds and County Conservative Club-House Competition. Mr. GEORGE CORSON, to whom the competitive designs were referred for examination, awarded the first prize to Mr. G. B. BULMER, of the firm of Messrs. PERKIN & BULMER; the second to Messrs. CHORLEY & CONNOR; and the third to Messrs. SMITH & TWEEDALE. The directors of the Club-House Company, Limited, have, however, thought fit to award the first prize and commission to carry out the works to Messrs. SMITH & TWEEDALE, and have awarded the third prize to Mr. BULMER, who declines to accept it, as he entered into the competition under the belief and understanding that the matter would be decided by the professional adviser retained by the directors. Mr. CORSON has no less reason to complain. It would appear to be the duty of an architect who is asked to report on plans to decline the office unless there is a guarantee that his recommendations will be adopted.

THE members of the newly-formed Dundee Institute of Architecture took part in the first excursion on Saturday last. It was under the guidance of the president, Mr. JAMES MACLAREN, who had prepared notes on the places to be visited. The Kirk and Castle of Dairsie were first seen. The Castle was built by Bishop LAMBERTON, the architect of St. Andrews Cathedral, and a Parliament was held within it in 1335. The Church of Dairsie was built by Archbishop SPOTTISWOODE in 1622, and presents the appearance of a hybrid between a parish church and an archiepiscopal chapel. After a visit to Ceres Church there was a stoppage at Scotstarvit, and lastly the parish kirk at Cupar was visited. The day's excursion was a success.

THE Committee of the City of Manchester Art Gallery have purchased the following pictures from the exhibition which is now open:—*The Herring Market at Sea*, by Mr. COLIN HUNTER, 84*ol.*; *Lifting Mist*, by Mr. JOSEPH KNIGHT, 225*l.*; *The Old Hall, Baddesley Clinton*, by Mr. E. F. BREWTNALL, 31*l.* 10*s.*; *May Day*, by Mr. R. CALDECOTT, 21*l.*

THE South Kensington Museum will shortly be enriched by the valuable collection of English pottery belonging to Lady CHARLOTTE SCHREIBER, which her ladyship intends to present to the nation when Mr. A. W. FRANKS has completed his catalogue of it. There is probably no collection more rich in examples of the rarest native manufacture. Not only the most elaborate coloured figures and groups of old Chelsea and the finest Battersea enamels, but the most curious variety of the salt-glaze wares of Staffordshire, as well as many other local fabrics, are to be found there. At present English pottery is not well represented in the museum, and the new addition will therefore be a desirable acquisition.

FIVE years ago the Corporation of Oswestry entrusted Mr. STANLEY LEIGHTON, M.P., with their records, in order that he might edit them among the papers of the Shropshire Archaeological Society. The work is now complete, and has been re-issued as a separate volume, with the following title:—"The Records of the Corporation of Oswestry, edited by Mr. STANLEY LEIGHTON, with an account of the Mayors, Stewards, Records, and Town Clerks, by Mr. ASKEW ROBERTS, reprinted from the Transactions of the Shropshire Archaeological Society." The collation and editing must have taken much time, but an excellent memorial of the town has been produced.

## ILLUSTRATIONS.

DESIGNS FOR THE ADMIRALTY AND WAR OFFICE.

THIS week we publish two illustrations showing the design of Messrs. MAXWELL & TUKE, and the Whitehall front designed by Messrs. GLOVER & SALTER. The former are on a smaller scale, owing to the character of the originals, which was not adapted for three-page illustrations.

## BRITISH ARCHÆOLOGICAL ASSOCIATION.

THE meeting of the Association at Tenby has given a good deal of satisfaction to the members who took part in it. The ground which was travelled over included many things which were novel to those who had not gone so far westward. The first address which followed the President's was one by Mr. George Lambert, F.S.A., on "The Origin and Use of Maces." Specimens were lent by the Corporations of Tenby, Pembroke, and Haverfordwest. He called special attention to one of the maces from Haverfordwest. It was a very old one, bearing as its date 1630 (time of Charles I.), and resembled one at Tenterden, which was the oldest known in this country. The maces on view at Tenby that day were in a most deplorable condition. The date of the Tenby maces was 1660, and it was stated on them that they had been repaired in 1737 and 1857. Mr. Lambert offered, if the mayor would allow him to take the maces, he would see that they were properly cleaned.

The town of Tenby was described by Mr. Edward Laws. It was stated that originally there were four gates to the town walls, which had been built, re-built, altered, modified, and further altered over a period of about 540 years. For about the last 230 years, however, or after the close of the wars occasioned in Cromwell's time, nothing had been done to the walls, either in building or to retard the natural consequences of increasing old age. There were nine towers left of those which originally existed, seven of them round, and two rectangular. Mr. Laws gave a *resumé* of the history of the town and the walls, and mentioned, *inter alia*, that on one occasion Tenby was well-nigh uninhabited, having been burned down by a Welsh prince. Proceeding from the hotel garden, the members wended their way to the new Baptist chapel premises, where a curious feature of the old wall was noticed in the form of small arches, which had now been filled up. Mr. Laws said he could not explain why this had been done.

Mr. Loftus Brock, F.S.A., remarked that whatever the age of the wall might be, the arches were comparatively modern. Considerable attention was bestowed upon the five-arch bastion.

The whole of the walls having been seen, the party went down round Quay Hill, and proceeded to the Museum on Castle Hill, where many local antiquarian objects had been collected. Mr. De Gray Birch described them, and first referred to the charters lying on the table, from Tenby, Haverfordwest, and Pembroke. With regard to one from Pembroke, a curious affair was pointed out. It was a charter purporting to have been granted to the town by Henry VIII., but it bore the seal of Henry III. The matter ought to be seen to by the town official at Pembroke. There was another charter to the same town granted by Edward IV. in the third year of his reign, confirming matters spoken of in previous documents. Tenby exhibited a charter granted by Edward IV., bearing date 1548, which also confirmed previous charters. It appeared that the town had petitioned the sovereign to be excused from paying tax, the corporation asserting that the town was unable to contribute. In another document, having date 1556, Elizabeth gave the lease of two windmills at a place now called Water Wynch. Tenby was spoken of in this connection as being "a decayed place." The Haverfordwest charters were more numerous than those from the other towns; but he thought the town clerk there would realise the necessity of preserving these documents in good order. Town officials were, it should be remembered, only custodians for the time being of these ancient charters, and every care should be taken that they were handed on to their successors in as good condition as possible. There was need on the part of most people to see that they were kept free from injury. They were the skins of animals, and the practice of keeping them in iron safes without ventilation was injurious. From Haverfordwest was exhibited an autograph letter sent by Oliver Cromwell, ordering the corporation to demolish the castle. The seals of Henry IV., Henry V., and Henry VI. were pointed out as being practically identical one with the other.

Mr. Edward Laws then referred to the statement of the president in his inaugural address to the effect that there were few, if any, evidences of a Roman occupation of Pembrokeshire. He showed a number of Roman coins in a glass case, which had been dug up in the neighbourhood, and some that he had personally discovered. He went on then to speak of the long barrow, which he had assisted in unearthing at Brownslade, the residence of Colonel Lambton. A collection of human skulls was found at the spot, and in making the excavations they brought up so many, said the speaker, that they almost felt ashamed

of themselves, and began to dig another pit to put them back in. In this second operation they came upon a real kistvaen, containing human bones, ox bones, sheep bones, and those of goats. They also came upon some small bronze rings, a stoop, and what was thought to be a portion of an early Christian chapel. The field was called Churchways, and an old gentleman living in the neighbourhood said he remembered the gable end of an old chapel standing there. A number of objects of interest were also shown as the result of excavations at Stackpole Warren, the site of what was supposed to be a pre-historic village. Several bronze implements were unearthed, and at one place where Lord Cawdor had been exploring there was a legend which told of a gold bedstead being in the ground. They did not, however, manage to get at the precious treasure, but human bones were found, and in the same neighbourhood there were implements of iron and of bronze, tending to show how the different ages overlapped.

A visit was next paid to the parish church of St. Mary, where the Rev. G. Huntington pointed out many features. The church is no doubt one of the most remarkable in Wales. Its dimensions are 145 feet by 80 broad, and the altar is approached by a flight of steps of such proportions and beauty as to be unsurpassed by few sacred edifices in the kingdom. The church must have grown to its present dimensions and aspect from a very small beginning, but there are, it was said, no documents giving dates. Appearances were in favour of the theory that the present building was really three churches, or portions of churches now constituting a single fabric. Notwithstanding its great size, and the fact that in the summer session they had to provide seating accommodation for about 1,800, the acoustic properties were excellent, the preacher with the greatest ease being able to make himself heard. This the rector attributed to the peculiar shape of the roof.

Mr. Loftus Brock, F.S.A., said although it differed in many respects from the majority of Pembrokeshire churches, it had, after all, a good number of the characteristics of the Welsh edifice. The church must have increased to its present proportions from very small beginnings. The town church and everything had, as they heard earlier in the evening, been burned down by a Welsh prince, and the sacred edifice had been restored afterwards. He fixed the first enlargement at probably the year 1250, as the architecture corresponded with that date, though if it were in England he would be inclined to put it one hundred and fifty years later. He endorsed the remarks of the rector as to the acoustic properties, and accounted for this excellence by the fact that the roof was not so high, in comparison with the great size of the church, as in most buildings. It would be an advantage if the example were followed in the present day.

The Bishop of St. David's thanked the rector and Mr. Brock for the very useful observations they had made.

The members of the Association and a number of visitors dined together at the public hall in the evening, the Bishop of St. David's presiding.

On the second day, the members and visitors started on an excursion to Brownslade, the seat of Colonel Lambton, for the examination of a long barrow recently opened.

Mr. Laws explained that the spot was come upon a short time ago, having previously been covered with sand. When digging began so many skulls were found that Col. Lambton and himself went to the centre of the field and proceeded to dig another place to put some of them in. Here, however, they came to a regular kistvaen, where were found the remains of a human body, evidently buried in a crouching posture, and the bones of some animals. A slab protecting the remains had a circle and a cross inscribed upon it. There were, therefore, many striking anomalies connected with the matter. Where could so many persons come from as were buried here in such a sparsely-populated district, and how were the facts to be explained that there were evidences of heathen and Christian burial in the spot, where, in addition, the bones of animals were found? About a hundred yards beyond was the foundation of what was supposed to be a small Christian chapel of great antiquity. It was discovered that both the chapel and the skeletons—one or two of the latter being almost perfect—were oriented, the bodies lying with their heads to the west and their feet to the east.

Mr. Wright said he did not think the lines on the tablet were those of a cross signifying anything connected with the Christian religion.

Sir James Picton thought they were standing on the site of a place of the greatest antiquity, and that this was one of the most important finds the Association had had.

Mr. Lambert thought the theories had not been proved.

The party afterwards visited earthworks supposed to have been used by the Britons for the repulse of the Danes. Next Castlemartin was visited for the inspection of the church and vicarage, under the guidance of the vicar, the Rev. C. Wilkinson. The site of an old castle was likewise to be looked for. The church at Castlemartin is in outline very like Manorbere, having apparently originally had a north transept and a chapel on each side of the chancel. In the porch there are certain peculiarities which have led to the opinion that a rood-loft formerly covered half of it. The stair which led to it has been diverted from its original use, and now gives access to the belfry. Considerable dignity is

given to the edifice by its massive arcade. The font is of good Norman design, and is probably older than the church, which is supposed to date from about 1180. The tower, a very remarkable one, stands on the south side, and shows signs of having been originally of the saddle-back form, and of having been altered into that which is usual in Pembrokeshire. The lines of a gable are distinctly marked on the east and west faces of the tower, in the masonry itself, so that they could not be traces of any building which stood against it. From Castlemartin the party proceeded, according to the programme, to Newton Burrows, where a cromlech, close by the high road, was to be examined and commented upon by Mr. Edward Scott. From Newton the drive was continued to the extremity of the promontory forming the southern arm of Milford Haven, and Angle was visited. The place is now celebrated for its rector, Giraldus Cambrensis, who flourished (in addition to his connection with the place) as the secretary, adviser, and travelling companion of Archbishop Baldwin, about the year 1200. Giraldus Cambrensis claimed Manorbere as the most lovely place in the whole world. It was well known, he said, that Manorbere was the most beautiful spot in Pembrokeshire, that Pembrokeshire was the most lovely district of Wales, and that Wales was the most beautiful place in the world. Therefore, he concluded, Manorbere was the most beautiful place in the world. From Angle the route lay to Rhoscrowther, where the party was received by the rector, the Rev. George H. Scott.

At the close of the second day's excursion, which included among its leading features a visit to the fine well-preserved remains of Manorbere Castle, situate on the seashore, about four miles from Tenby, and a cromlech within a mile of the same spot, and an inspection of the remains of Lamphey Palace, once the residence of the bishop of the diocese, there was an evening meeting for the reading of papers at the town hall, at which the chair was taken by Mr. Morgan, and two papers of interest were read, viz., first by Sir James Picton, and second by Mr. Laws, both on ethnological subjects connected with the district. Sir James Picton entitled his paper "Notes on Place Names in Pembrokeshire, Illustrative of its History and Ethnology." After references to the early inhabitants of the district, he said the basis of the place names of Pembrokeshire was undoubtedly Cymric. The name of the county—Penbro, the "head, or projection of land," showed this. The salient features of the county were pure Cymric, such as the Rivers Teifi, Taff, Towy, Avon, Gwaen (white or clear), the Cleddau, east and west (quiet river), and the mountains Mynydd Preseley, Moel Feddau, Bidd Arthur, Foel Erni, Marros, &c. The names of the towns, villages, and hamlets to a great extent told the same tale, the Llans, the Abers, the Pants, the Llwyns, the Rhoses, the Caers—*cum multis aliis*—commemorated the early settlers on the soil. Sir James observed that they might expect to find a similarity in the Celtic nomenclature between Pembrokeshire and Cornwall, and this was really the case. An old saw told them that

By Tre, Pol, and Pen,  
You shall know the Cornish men,

and he went on to show that the prevalence of these three appellations was quite as common in Pembrokeshire as in Cornwall, of which he gave instances. Another link of connection between the two shores of the Severn Sea was in the names of the saints to whom the early churches were dedicated, many of which were to be found nowhere else. Next, reviewing the history of Pembrokeshire with regard to its successive occupants, he came to the vexed question of the settlement of Flemings, which he briefly disposed of. In 1108, he said, to strengthen the hands of the Norman overlords, a colony of Flemings, expatriated by some political crisis in Flanders, were encouraged to settle in Pembrokeshire. They took up the same district which had been partially occupied by the kindred Norsemen two hundred years previously, and contributed to the change of nomenclature already initiated. Their range of vocabulary was not very extensive. The connection of Pembrokeshire with the conquest of Ireland was next referred to. In 1167, he said, letters patent were issued by Henry I. on behalf of Dermot MacMurrough, Prince of Leinster, who had been ejected from his kingdom, authorising all Englishmen, Normans, and Scots to go to his assistance. This was responded to by Richard de Clare, Earl of Pembroke, commonly called Strongbow. With the aid of two Pembrokeshire lords, Robert FitzStephen and Maurice Fitzgerald, a small force of picked men was raised, and the invasion of Ireland, which was to lead to such momentous consequences, was begun. Strongbow's army consisted principally of the Flemings of Pembrokeshire. At the very commencement of the war a grant was made by MacMurrough to the two Pembrokeshire chiefs of the town of Wexford, with two candreds or hundreds of land in the neighbourhood. These were occupied and settled by the Flemings of Pembrokeshire, and constitute the baronies of Forth and Bargo. Their descendants down to a very recent period kept themselves as distinct from the native Irish as the descendants of the Flemings in Pembrokeshire from the Welsh, maintaining their own language, manners, and customs.

A short discussion followed, in the course of which Mr. de Gray Buret having uttered an opinion that first impressions of the origin of places derived from surrounding circumstances were

always erroneous, Sir J. Picton and other speakers protested against such "sweeping views," the latter asking did not Newton indicate new town, Oldbury an old one, and was not Westminster named after its minster? To this Mr. de Buret pointed to Cambridge—apparently derived from the river Cam and a bridge—whereas Cambridge was not the original name of the place, but Granta, and they could not find Cambridge on old documents further back than the fifteenth century. In discussing the origin of the name of Tenby the absence of any visitor or native well versed in Welsh was deplored.

Mr. Laws next read a paper on the "Local Ethnology."

On the third day the archaeologists, nearly one hundred in number, went by special train from Tenby to Pembroke, where, meeting the carriages provided for them, they drove through a picturesque stretch of country to the Stack Rocks, and thence to the ruined chapel of St. Govan—a holy man of the sixth century, who, tradition asserts, had a cell or hermitage amid the rocks; and incorporating which, in the thirteenth century, the date assigned to the present building by Mr. Loftus Brock, F.S.A., a chapel was erected to his memory. Continuing their drive under the guidance of Mr. Edward Laws, hon. local secretary, the party reached Bosherton Church, where they were met by the Rev. George H. Scott, who, in the absence of the vicar, the Rev. C. Morgan, through illness, described the principal objects of interest in the sacred edifice. About one o'clock Stackpole Court was reached, and, after a luncheon was partaken of, some of the ladies and gentlemen set off with Colonel and Lady Victoria Lambton to the pre-historic village on Stackpole Warren; but as no barrow had been opened for them, as had been expected, there was little or nothing for them to see. Another portion of the party, by permission of the Earl of Cawdor, who was unfortunately absent from home, inspected the library and family pictures in the house. The party proceeded to pay a passing visit to Cheriton Elidur Church, where they inspected, under the guidance of the Rev. Mr. Morgan, the fine effigy of Elidur de Stackpole, as it is assumed to be, and the interesting monuments and effigies in the Cawdor chapel, which Colonel Bramble made some remarks upon, as did also Mr. George Lambert, F.S.A., on an Elizabethan silver chalice belonging to the communion plate. The seventeenth-century tomb of Roger Lort, through whom the Stackpole property came to the Cawdor family, was also examined, as well as the interesting monument to Ranald Campbell, a promising young soldier who was unfortunately killed in Zululand by the side of Sir Evelyn Wood a few years ago. This closed a pleasant and instructive day's proceedings; and in the evening at the town hall, with the Rev. G. Huntington, the rector of Tenby, in the chair, two papers were read, one by Mr. Thomas Morgan, F.S.A., hon. treasurer of the Association, and the other by Mr. Osborn Allen, both of which gave rise to a prolonged discussion as to the want of positive evidence of the Flemings ever having been settled in South Wales.

Saturday was the first and only wet day to at all inconvenience the archaeologists, who, despite a heavy and continuous rain, did not abate in their ardour, but carried through their programme in high spirits and evident enjoyment. Gurfreston Church was first visited, and here, in the absence of the rector, Mr. Charles Lynam read an interesting paper on its history, illustrating his subject by several drawings and rubbings of inscriptions, &c., made by Miss Smith, the daughter of a former well-known and much-respected clergyman of the parish of that name. St. Florence Church, a very singular example of Norman architecture, and looking almost sepulchral from its unadorned cavernous-like arches in the transept and by the side of the chancel, was next reached, and here the ladies and gentlemen of the party listened with much interest to the Rev. E. J. S. Rudd, rector and vicar, who read a paper upon it, and the supposed causes of the name "St. Florence" being applied to the parish, and heard Mr. Loftus Brock, F.S.A., ably describe its architectural and other features. Carew Castle was the next halt of the party, and here, notwithstanding the rain, which still fell heavily, a large portion of the party examined the fine old cross outside the castle wall, with interlacings and other rich ornamentation on it, so often considered to be of Runic character, though wrongly so, as Mr. Edward Laws, the hon. local secretary afterwards explained, by reading the curious inscription on the monolith, which, he said, had been deciphered only lately by Professors Sayce and Rhys, of Oxford. At the castle the party were hospitably entertained at luncheon within the ruined chapel by Mr. Charles Allen, of Tenby, after which a full examination was made of this "smaller Kenilworth," as it was well denominated by Mr. Loftus Brock, who undertook to describe its early history and architecture, telling his auditors that it chiefly consisted of buildings of Henry VII. and Elizabeth's times, although he had been fortunate to discover that afternoon, on seeing it for the first time, evidences of Norman work in a doorway and small rooms adjoining it.

The church of the parish was next visited, and there the party were met by the Rev. J. P. Morgan, who briefly described some of its features, showing some interesting entries in the register book, dating from the sixteenth century; while Colonel Bramble made some remarks on two effigies within the chancel of rather curious armour and costume.

On the silver horn being sounded by Mr. Wright, the hon. congress secretary, the party once more mounted their carriages and were driven to Upton Castle, the seat of Mr. H. Halford Vaughan, some time Regius Professor of Modern History in Oxford, whose work on "New Renderings of Shakspeare's Tragedies" is deservedly known. This gentleman welcomed the party to his residence, and at once conducting them to the disused chapel in the grounds of the castle, read them a very exhaustive account of the famous effigy of one of the Malefant family of the time of Richard II. lying within a richly canopied tomb, and described its armour, as well as the costume of another effigy of the same date, which, with its reticulated head-dress and closely-fitting costume, having the peculiarity of a sleeve ending at the knuckles of the hand, greatly interested the ladies of the party. Mr. Vaughan then led the visitors to his library, where he showed them a goodly collection of Shakspearean literature, with the facsimiles of some of the early quarto plays, which he explained had been produced through the care and energy of Mr. Halliwell Phillips, and also a copy of Euripides, in first-rate condition, once belonging to John Milton, and having his name and manuscript annotations within it.

In the town hall, at 8.30, with the Mayor, Mr. W. H. Richards, in the chair, a paper was read by Mr. Loftus Brock F.S.A., on "Historical Evidences of the extent of the Ancient British Church," which caused an interesting discussion in which the Rev. George Huntington, Mr. Lambert, F.S.A., Mr. Morgan F.S.A., and Mr. Edward Laws took part.

In the midst of much rain, which decidedly thinned the ranks of the members and visitors, a goodly number of the archaeologists left Tenby on Monday by special train for Pembroke, and then at once proceeded from the station through the long and straggling town to the Castle, where they were met by the vicar of St. Nicholas Monkton, the Rev. David Bowyer, and others. The site of the chapel gave rise to a discussion, and Mr. Brock expressed his opinion that the real site was yet to be found under the accumulated earth, none of the existing buildings presenting any special characteristics of a chapel. The large natural covers beneath the castle and on the river-side were then referred to. The continued rain unfortunately prevented as complete a perambulation of the stronghold as could have been desired, and the party, much more quickly than they otherwise would have done, set out for the church of Monkton, on the opposite hill to the Castle. Here, under the guidance of the Rev. David Bower, they made an examination of its many singular as well as most interesting architectural features. The church of the adjoining Benedictine Priory is in ruins. It is one of the very few instances remaining of a parochial and monastic church in one building, as was proved in a case which occupied the time of a law court a few years since. It is proposed to restore this portion of the sacred edifice. At the east end of the nave is a thick wall, pierced by a round-headed arch separating the nave and the choir. It was generally thought that this wall was original, and should, if possible, be preserved. The south porch has evidently contained another of the curious porch galleries noticed on Wednesday last. These galleries have hitherto been considered to be peculiar to Somerset, and their existence here is an additional point of resemblance in the architecture of the two counties. After luncheon at the King's Arms Hotel, the party returned to Tenby by railway, well pleased with their day's most instructive doings. In the evening, at the town hall, with the Mayor of Tenby, Mr. W. H. Richards, in the chair, the closing meeting of the Congress was held, Mr. Walter de Gray Birch, F.S.A., beforehand having given an interesting account of the Tenby charters. Tuesday, Wednesday, and Thursday, as extra days, were devoted to a visit to Haverfordwest and Picton Castle, where its hospitable owner, Mr. Charles E. G. Phillips, entertained the party, and to an excursion to St. David's, where on Wednesday the Bishop, as president, received the archaeologists in the famous Gower Palæe to luncheon.

## MEDIÆVAL AND MODERN CRAFTSMANSHIP.\*

IT must be admitted that every architectural work is a work of co-operation. The very designer, be he never so original, pays his debt to this necessity in being, in some form or other, under the influence of tradition. Dead men guide his hands even when he forgets that they ever existed. Furthermore, he must get his ideas carried out by other men. No man can erect a building with his own hands. Every one of these men depends for the possibility of ever beginning his work on some one else. Each is but part of a machine; the parts may be but machines themselves, or they may be intelligent; but in either case they must work in subordination to the general body. Men so working must be influenced in their work by the conditions of life, and the man who organises the labour must make up his mind that he can only get labour of a kind which those conditions have bred. To expect

enthusiasm for good workmanship from men who for two generations have been accustomed to work slovenly would be absurd; to expect consciousness of beauty from men who for ten generations have not been allowed to produce beauty, more absurd still. The workmanship of every piece of co-operative work must belong to its period, and be characteristic of it. Thus, all architectural work must be co-operative; in all co-operative work the finished wares can be no better in quality than the lowest, simplest, or widest grade, which is also the most essential, will allow them to be, and the kind and quality of that work, the work of the ordinary handicraftsman, is determined by the social conditions under which he lives which differ most from age to age.

Let us try to see how they have differed, and glance at the results of that difference, during which inquiry we shall have much more to do with the developed Middle Ages, with the work of which our society is chiefly concerned, than with any other period.

In the Classical period industrial production was chiefly carried on by slaves, whose person and work alike belonged to their employers, and who were sustained at just such standard of life as suited the interests of the said employers. It was natural that under such circumstances industrialism should be despised; but under Greek civilisation, at least, ordinary life for the free citizens, the aristocracy, in fact, was simple; the climate was not exacting of elaborate work for the purposes of clothing and shelter; the race was yet young, vigorous, and physically beautiful. The aristocracy, therefore, freed from the necessity of rough and exhausting work by their possession of chattel slaves, and little oppressed with anxieties for their livelihood, had, in spite of the constant brawling and piracy, both inclination and leisure to cultivate the higher intellectual arts, within the limits which their natural love of the matter-of-fact and hatred of romance prescribed to them; the lesser arts meanwhile being kept in rigid, and indeed slavish, subordination to them, as was natural. Had any Athenian gentleman attempted to build a Gothic cathedral in the days of Pericles, what sort of help would he have had from slave labourers of the day, and what kind of Gothic would they have produced for him? The ideal of art established by the intellect of the Greek, with such splendid and overwhelming success, lasted throughout the whole period also, in spite of the invention and use of the arch in architecture, or rather in building; and side by side with it chattel slavery, under somewhat changed conditions, produced the ordinary wants of life. The intellectual arts of Classical times had, even in Pliny's days, long fallen from their zenith, and had to wade through weary centuries of academicalism, from which they were at last redeemed by no recurrence of individual genius to the earlier and human period, but by the break-up of Classical society itself, which involved the change of chattel slavery into serfdom or villeinage, on which the feudal system was based. In place of the system of aristocratic citizen and chattel without rights, dominated by the worship of the city, which was the ideal of Classic society, was formed a system of personal duties and rights, personal service and protection in subordination to *à priori* ideas of mankind's duties to and claims from the unseen powers of the universe. The serf was in a very different condition from the chattel slave; for, certain definite duties being performed for his lord, he was, in theory at least, at liberty to earn his living as he best could within the limits of his manor. This chattel, as an individual, had the hope of manumission, but collectively there was no hope for him but in the overthrow of the society founded on his subjection. The serf, on the other hand, was by the conditions of his labour forced to strive to better himself as an individual, and collectively soon began to acquire rights amidst the clashing rights of king, lord, and burgher. Also, quite early in the Middle Ages, a new and mighty force began to germinate for the help of labour, the first signs of secular combination among free men, producers and distributors.

The guilds, whose first beginning in England dates from before the Norman Conquest, although they fully recognised the hierarchical conditions of society, and were indeed often in early times mainly religious in their aims, did not spring from ecclesiasticism. England and Denmark were the foremost countries in the development of the guilds, which took root latest and most feebly in the Latinised countries. The spirit of combination spread; the guilds, which at first had been rather benefit-societies or clubs, soon developed into bodies for the protection and freedom of commerce, and rapidly became powerful merchant guilds. In the height of their power there formed under them another set of guilds, whose object was the regulation and practice of crafts in freedom from feudal exactions. The older merchant guild resisted these newer institutions, so much so that in Germany there were bloody and desperate wars between them. In England the merchants' guilds changed in a peaceable manner, and became in the main the corporations of the town, and the craft guilds took their deputed place as regulators and protectors of all handicrafts. By the beginning of the fourteenth century, the supremacy of the craft guilds was complete, and at that period their constitution was thoroughly democratic. Mere journeymen there were none, for the apprentices were sure, as a matter of course, to take their places as masters of their craft, when they had learned it.

Let us now look at the conditions of the life of the craftsman.

\* From an address by Mr. William Morris, M.A., delivered to the Society for the Protection of Ancient Buildings.

He lived, however roughly, more easily than his successor does now. He worked for no master save the public; he made his wares from beginning to end himself, and sold them himself to the man who was going to use them. This was the case with nearly all the goods made in England, all the more so as the materials of any country were chiefly wrought into goods close to their birth-place. It followed, from the direct intercourse between the maker and the consumer of goods, that the public in general were good judges of manufactured wares, and that the art of adulteration was scarcely known. Now, as to the manner of work. There was little or no division of labour in each craft, which was some mitigation of the evil of a man being bound down to one craft life-long—some mitigation because there was plenty of variety in the work of a man who made the whole of a piece of goods himself, instead of making one little piece of a piece. The English craftsman of the fourteenth century was not the priest-ridden, down-trodden savage of whom pedant historians have written, but a thoughtful and vigorous man, and in some sense free. He worked, not for the profit of a master, but for his own livelihood, which he did not find it difficult to earn, so that he had a good deal of leisure. Being master of his tools and his material, he was not bound to turn out his work shabbily, but could afford to amuse himself by giving artistic finish. Such finish was not venal; it was given freely to the public, who paid for it by interest in and sympathy for the work itself. For all that, what are now called "the wages of genius" were much neglected by the builders of our ancient buildings; for all that, craftsmanship, as Mr. Thorold Rogers says, was widespread; the possession of some skill in it was the rule, and not the exception. Those who could afford to pay for a building were able to do the necessary planning and designing, obviously because they could naturally find help and harmonious intelligence among the men they had to employ. It followed from this widespread skill in the arts that those poor wretches who had skill and taste beyond their fellow-workmen, and who consequently had pleasanter work than they, had to put up with a very moderate additional wage, or with nothing additional. They could not make good the claim now preferred for that much sinned against and that much sinning company, men of genius, that the conformation of their stomachs and the make of their skin is different from other men, and that consequently they want more to eat and drink, and different raiment from their fellows.

When we hear that extra money payment is necessary under all circumstances to produce great works of art, we can appeal to the witness of those lovely works still left to us, whose unknown, unnamed creators were content to give them to the world with little more wages than their pleasure in their work and their sense of usefulness in it might give them. A body of artificers so living and so working with simple instruments, of which they were complete masters, had very great advantages for the production of architectural art, using that term in its widest sense, and that one would expect to find in their work that thoughtfulness and fertility of resource, that blended freedom and harmonious co-operation, which we actually find in that work. Nevertheless, the Mediæval workman was still compelled to work only as tradition would allow him to do. If it could ever have occurred to any man to build some new Parthenon or Erechtheum by the banks of Thames, Wharfe, or Wensum, in the fourteenth century, how far do you think his fellow-workman's skill would have been able to second his folly?

Hurrying on from this fourteenth century, we see that, although the constitution of the craft's guild was at first thoroughly democratic or fraternal, it did not long remain so. As the towns grew bigger the old craftsmen began to form a separate and privileged class in the guilds, with their acknowledged apprentices, and the journeyman made his appearance. After a while the journeymen attempted to form guilds under the master crafts, as the latter had done under the merchant guilds; but the economic condition of the time beat them, and they failed. Still, the conditions of work did not change much; the masters were checked by laws in favour of the journeymen, and wages rather rose than fell all through the fifteenth century, nor did division of labour begin till much later. Everywhere the artisan was still an artist. The beginning of the great change came with the Tudors in the first quarter of the sixteenth century, during which England, from being a country of tillage cultivated for livelihood, became a grazing country farmed for profit. He who runs may read the tale of this change, and its miseries, in the writings of Moore and Latimer. It had a very direct influence on the conditions of life and manner of work of the artisans, for the crafts were now flooded by the crowds of landless men who had nothing but the force of their bodies to live on, and were obliged to sell that force day by day, for what those would give them who certainly would not buy labour unless they could make a profit by it. The brutal rapine with which the change of religion in England was carried out, the wanton destruction of our public buildings which accompanied the stealing of our public lands, doubtless played its part in degrading what art was still possible under the new conditions of labour. But the Reformation itself was only one of the aspects of the new spirit of the time produced by great economic changes, and which dealt with art and its creator, labour, far more

completely than any series of accidents could do, however momentous they might be. The change in the condition of labour went on speedily, though there was still a good deal of domestic manufacture; the workmen in the towns got to be more dependent on their employers, more and more mere journeymen, and a great change was coming over the manner of their work. The mere collection of them into big workshops under one master in itself gave economy of space, rent, fuel, lighting, and the rest; but it was the prelude to a much greater change. Division of labour now began and rapidly gained head under the old mediæval conditions; the unit of labour was a master craftsman who knew his business from beginning to end. Such help as he had was from mere apprentices who were learning the business and were not doomed to life-long service.

With the new system of master and men came the change that the unit of production was a group, each member of which depended on every one of the others and was helpless without them. Under the division-of-labour system a man is very often condemned for the whole of his life to make the insignificant portion of an insignificant article of the market. The birth and growth of this division-of-labour system was no mere accident, was not the result and mean of some passing and inexplicable fashion which caused men to desire that kind of work which could be done by such means. It was caused by economical changes which forced men to produce no longer for a livelihood as they used to do, but for a profit. Almost all goods—all except those made in the most domestic way—had now to go through the market before they reached the user's hands. They were in fact made for sale, and not primarily for use; the art in them, as well as their mere obvious utility, was now become a marketable article, doled out according to the necessities of the capitalist, who employed both machine, workman, and designer, fettered by the needs of profit. For by this time, instead of all the workmen being artists as they once were, they were divided into workmen who were not artists and artists who were not workmen. This change was complete or nearly so by the middle of the eighteenth century. The gradual degradation of the arts from the fifteenth century to this point was steady and certain. Only among men who were more or less outside the great stream of civilisation, where life was rude and production wholly domestic, did the article retain any signs of human pleasure; elsewhere pedantry reigned supreme. The picture-painters who were wont to show us, as through windows opened by them, the longings and lives of the saints and heroes, nay, the very heavens and city of God hanging over the earthly city of their love, "were turned"—what few of them were aught else than pretentious daubers—"into courtly flatterers of ill-favoured fine ladies and stupid, supercilious lords."

As for the architectural arts, what could you expect to get of them from a set of human machines, co-operating, indeed, but only for speed and precision at reproduction, and designed for at best by pedants who despised the lives of men, and, at worst, by mechanical drudges, little better in any way than the luckless workmen! Whatever might be expected, nothing was got but that mass of foolish toys and costly ministrations to luxury and ostentation, which has since those days been most worthily continued under the name of upholstery.

Is that the end of the story of the degradation of the arts? No; there is another act to the drama, worse or better, according to whether you are contented to accept it as final, or have been stimulated to discontent, that is, hope for something better. From being reduced to a machine, the workman was pushed down from even that giddy eminence of self-respect. At the close of the eighteenth century England was a country that manufactured among other countries that manufactured. Her manufactures were still secondary to her merely country life, and were mixed up with it. In fifty years all that was changed, and England was the manufacturing country of the world, the workshop of the world. This strange and most momentous revolution was brought about by the machinery which the chances and changes of the world forced on our population. Whereas under the eighteenth-century division of the labour system, a man was compelled to labour for ever at a trifling piece of work in a base, mechanical way, under the system of the factory and almost automatic machines under which we now live, he may change his work often enough, he may be shifted from machine to machine, and scarcely know that he is producing anything at all. Under the eighteenth-century system he was reduced to a machine. It is the machine which bids him what to do on pain of death by starvation; if it please to hurry it can make him walk thirty miles a day instead of twenty miles, and send him to the workhouse if he refuses. If you inquire which is the worse off, the machine-workman of the eighteenth century or the slave to the machine of the nineteenth-century, I am bound to say that I think the former is; but the question as to which produced the better work is different and less complicated. The machine workman had to be well skilled in his contemptible task at least; the slave to the machine needs but little skill, and, as a matter of fact, his place has been taken by women and children, and what skill is needed in the work goes in the overlooking of the labours of the latter. In short, the present system of the factory and its dominating machine tends to do away with skilled labour altogether. Hence there is a strange contrast

between the craftsman of the Middle Ages and him of to-day. The mediæval man set to work in his own time, in his own house; probably made his tool, instrument, or simple machine himself, even before he began with his web or bundle of clay; what ornament there should be on the finished work he himself determined, and his mind and hand designed it and carried it out. Tradition in the concrete form of the custom of his craft guided and helped him, but otherwise he was free; and, even if he lived in a town, the field and sweet country came close up to his house, and at times he occupied himself in working in them.

But how does he who has taken his place work and live? He has to be at the factory gates by the time the bell rings, or he is fined or sent to grass—nay, not always will the factory gate open to him. There before his machine, up and down he has to follow it, day in and day out, and what thought he has must be given to something else than his work. It is as much as he can do to know what the machine is doing. Design and ornament, what has he to do with either? He may be tending a machine which is making a decent piece of work, or he may be a very small accomplice in turning out a blatant piece of knavery and imposture; for the one or the other he will get as much wages. He is lodged in a sweltering dog-hole, with miles and miles of similar dog-holes between him and the fair fields of the country, which in grim mockery is called "his." Sometimes, on holidays, he is bundled out by train to have a look at it, to be bundled into his grimy hell again in the evening.

At what period of a working-man's life, then, will you pick him up and set him to imitating the work of the free craft-guildsman of the fourteenth century, and expect him to turn out work like his in quality? Not to weaken my argument by exaggeration, I admit that though a huge quantity of would-be artistic work is done by this slave of the machine at the bidding of some market or other, the crafts relating to building have not reached that point in the industrial revolution. They are an example of my assertion that the eighteenth-century division-of-labour system still existed and worked side by side with the great factory and machine system. Yet here, too, the progress of the degradation is obvious enough, since the similar craftsmen of the eighteenth century still had lingering among them scraps of tradition from the times of art now lost; while now in those crafts the division-of-labour system has eaten deep, from the architect to the hodman, and moreover, the standard of excellence, so far from its bearing any relation to that of the free workman of the guilds, has sunk far below that of the man enslaved by division of labour in the eighteenth century, and is not a whit better than that of the shoddy-maker of the great industries.

## FOUNDATIONS IN BLUE CLAY.

AN account has been given by Mr. W. J. M'Alpine of the method employed for constructing the foundations of the New Capitol at Albany, United States. The soil was apparently equable and stable, but proved on careful examination to lack these qualities. It was also found that the earth, to a great depth under many portions of the foundations, received and parted with a considerable amount of moisture with the changing seasons. The circumstances of the case did not allow the use of piles or inverted arches; it was, therefore, necessary to spread the base of the walls over such an area as would afford the requisite sustaining power, and also to protect the clay and sand from any excess or deprivation of its natural degree of moisture, so as at all times to derive from it the same degree of support.

Although a single building, the Capitol may be considered as a collection of a dozen large ones, with great differences of elevations, and weights upon the lower walls, and yet so bonded together as to require that the pressure of each of the parts should be the same per square foot on the earth beneath. This object has been fully accomplished; and when the structure is loaded to the maximum extent of 200,000 American tons, Mr. M'Alpine believes that it will not compress the earth upon which it rests more than three-fourths of an inch, and exactly the same under every part thereof. The building measures nearly 300 feet by 400 feet on plan, and has three main storeys and a basement. The lower walls are 110 feet high, but those of the corner towers, pavilions, and main tower are of much greater height.

The ground covered by the structure sloped eastward at the rate of 1 in 25. The pit was excavated to a depth of 5 feet below the natural surface at the south-east corner, and 25 feet at the north-west corner. The excavation, together with the borings which were made in the bottom of the pit, fully exhibited the character of the earth. The lower strata (termed in the locality "blue clay," and "Albany clay") are more than 100 feet in thickness, resting upon the Hudson River argillite (a clay state), the two forming the banks of the river for 30 miles of its course. The "blue clay" contains from 60 to 90 per cent. of alumina, the remainder is fine silicious sand. It also contains many nodules of clay, highly charged with carbonate of lime in the form of rings and discs about an inch in diameter. Overlying the blue clay was a mass of earth from 1 foot to 35 feet deep, composed of the same clay mixed with sand of different degrees of fineness, in propor-

tions varying to such an extent as, when saturated, to render it in some places a semi-fluid, while in others it was nearly pure sand, and very porous. This material occurred in veins and strata, large and small, above and below the level fixed for the foundation. One of the largest of these veins of viscid earth passed diagonally across the foundation, and at a depth of 6 to 20 feet below the bottom of the pit. It was 200 feet long, and from 5 to 25 feet wide.\* Other veins and strata of less size were found extending across the bottom, and sometimes terminating in pockets in the blue clay. Borings from 10 to 30 feet deep were made in several places below the bottom of the pit, which showed the substratum to be blue clay; and a well which had been sunk close by to a depth of 100 feet was entirely in the blue clay.

The earth in its natural condition at midsummer contained from 27 to 43 per cent. of moisture. When the samples were thoroughly dried and pulverised and again fully saturated (without dripping), they absorbed from 39 to 46 per cent. of water. The blue clay ordinarily held about 40 per cent., and when dried, again absorbed about 43 per cent. It was, therefore, as a rule, completely saturated in its natural state. It was upon this kind of earth that the subsequent experiments of the supporting power of the clay were made. The pure clay, obtained by separating it from the sand, weighed 116 lbs., and the sand so separated 80 lbs., per cubic foot; but when they were again mixed in different proportions the weight of the mixture was less than the proportionate means between them. Earth taken from the same places as the samples varied from 80.5 to 101.4 lbs. per cubic foot, depending upon the proportions of the clay and sand; and these weights show, to some extent, the relative supporting power of the earth at the places from which the samples were taken.

It was originally intended to support the structure upon wooden piles, of which a considerable number had been procured before Mr. M'Alpine was entrusted with the direction of the work. Many comparatively large buildings in Albany have been supported upon wooden piles driven into the blue clay, or upon thick planks laid under the walls. In a few cases the wood used for this purpose has been found in tolerable preservation half a century after it had been buried in the blue clay; but, generally, such timber was much decayed at the end of a quarter of a century; and several heavy buildings, after having stood firm for twenty years, began to settle, and the walls to crack, in consequence of the decay of the wooden supports, and the unequal settlements therefrom. It appears that when the clay had been kept constantly moist, the wood did not materially decay in half a century; but, wherever the moisture was drawn off, the wood did not last more than twelve years. In this case, even if a wooden foundation could have been arranged so as to be kept constantly wet, it would have ultimately decayed; and its use was, therefore, inadmissible. Cast-iron piles of white iron could be relied upon for a century or more, but would also have eventually decayed.

The use of sand and concrete piles, made by boring or driving holes into the clay and filling them with these materials, was also considered. For reasons which will subsequently appear, inverted arches could only be used under a part of the structure,† and it was deemed advisable to have but one system of support. Mr. M'Alpine, therefore, finally determined upon the plan which has been executed.

In most buildings, except where spires or towers are introduced, the weight is nearly equally imposed upon the several foundation walls; but in the Capitol the main and pavilion towers are much higher and heavier than the adjacent walls. The extremely heavy fireproof floors, loaded as they will be frequently with dense crowds of people, books, &c., must necessarily carry their load to two only of the four surrounding walls, and, with some of the roofs acting in the same manner, will produce very unequal pressures upon the foundations.

The weight of the whole building and its contents when in use will be 200,000 American tons. The area of the base of the exterior and court walls, and the rear walls opposite, is about 24,000 square feet, and sustains an average of 6½ tons per square foot on the basement walls. The main tower, which weighs 30,000 tons, has an area of 2,508 square feet, equal to 12 tons per square foot upon its foundation walls. The weight on the foundation under the exterior walls of the corner towers is 47 tons per lineal foot; on the interior walls of the same towers, it is only 39 tons; and on the adjacent division walls, 23½ tons. Still greater differences in the weight on adjacent walls occur in other parts of the building, especially at the main tower, where the weight is 134 tons per lineal foot, and on the adjacent walls but 47 tons and 39 tons. Passing around the exterior walls of one quarter of the structure (the remainder being a repetition of the same-sized walls),

\* This vein was dug out and replaced with clay and sand artificially mixed, moistened, and slightly rammed in layers, so as to render it as similar to the adjacent natural material as possible.

† It was necessary to arrange to carry two-thirds of the weight upon the exterior, rear, and court walls, which are separated 120 feet on two of the fronts, and only 90 feet on the other two. Inverted arches spanning three very unequal spaces would have imposed unequal loads upon the clay beneath, and their use would have defeated the design of distributing exactly the same weight upon every part of the clay beneath the structure.

the weights to be supported per lineal foot are successively as follows:—Commencing at the main tower, 134 tons (which may possibly be increased); the adjacent walls are 47 tons per lineal foot for 60 feet; next, 44½ tons for 60 feet; next, 47 tons for 120 feet (turning the corner tower); next, 44½ tons for 60 feet; next, 67 tons for 18 feet; and next, 50 tons for 52 feet to the centre of the south or north front. On the rear of each of these walls the interior wall is loaded with 39 tons, and the division walls with 8½ to 23½ tons per lineal foot.

The exterior walls of cut granite facing, backed with rubble and brick, average 150 lbs. per cubic foot. The floors, including the iron box girders, cross beams, brick arches and covering average 24 lbs. per square foot. The possible weight of crowds of people upon the floors is taken at 100 lbs. per square foot; the snow upon the roofs, at 2 feet depth, is 12½ lbs.; and the effect of the strongest winds, which may at times be deflected perpendicularly against some of the roofs, is taken at 15 lbs. per square foot. The calculated weight which may come upon each of the walls is as follows:—On the corner towers and front foundation walls, 47 tons per lineal foot; on the main east and west front, 50 tons; on the curtains, 44½ tons; on the ventilating tower, 67 tons; on the division walls, extending upwards through four storeys, 23½ tons; on the partition walls of two storeys, 13½ tons, and of those which extend one storey high, 8½ tons per lineal foot. The main tower is designed to be of stone, except the portion immediately below the dome, which, from being so high from view, was proposed to be made of iron. If it should be of stone to the dome, that change, together with some others, would increase its weight to 36,000 tons, equal to 14½ tons per square foot at the base. Its footing stones were spread to 110 feet square, and the concrete to 125 feet square, and 5 feet thickness. The weight on the clay, with 30,000 tons, is 1·92 ton per square foot; and with 36,000 tons it would be 9·3 tons; but it was arranged for an underpinning, if necessary.

#### *The Experiments.*

For the purpose of ascertaining the sustaining power of the blue clay in its natural condition, two sets of experiments were made; in the first by pressure upon a square foot, and in the second upon a square yard, of the surface. The machine used was a mast of timber 12 inches square, held perpendicularly by guys, with a cross frame for the weights. A hole was dug, 3 feet deep, in the bottom of the blue clay foundation, 18 inches square at the top, and 14 inches at the bottom. The foot of the machine was placed in this hole, and weights from 2,754 lbs. to 23,784 lbs. were applied. Small stakes were driven into the ground, in radial lines from the centre of the hole, and the tops carefully driven to the same level; and by means of a straight-edge any change in the surface of the ground adjacent to the hole could readily be detected and measured.

There was a continued settlement of the clay under the foot of the machine as the loads were added, but no change in the surface of the adjacent ground was observed until an hour after a weight of 11,844 lbs. had been applied, when an uplift of the surrounding earth was noted, in the form of a ring with an irregular rounded surface, the contents of which, above the previous surface, measured 0·09 cubic foot, which is equivalent to a displacement of 1·09 inch of clay in depth under the foot of the machine, or equal to one-fifth of the whole settlement which had then occurred.

When the weight had reached 20,954 lbs., and had rested for half an hour upon the clay, a further protrusion was noted. The form of the ring was the same as before, but with more irregularity of surface. The highest part of the protrusion was from 12 to 15 inches from the edge of the pit, where it averaged 0·3 inch high, and sloped off outwardly to an average of 4 feet from the centre of the hole. This uplifted earth measured 0·606 cubic foot, which is equivalent to a displacement of 7·272 inches. When a weight of 23,784 lbs. had been applied, and had rested three hours on the clay the ring in the highest part averaged 0·5 inch high, in the same general form and extent as before noted. The amount of earth thus raised was 1·01 cubic foot, equivalent to a displacement of 12·12 inches under the machine.

Before the lifting of the earth surrounding the machine could have taken place, the materials first displaced from under the machine were doubtless forced among the particles of the earth adjacent to the whole, and compressed that earth to some extent; and this operation was continued until the adjacent earth had become so compacted as to cause the lifts noted in the table. Mr. M'Alpine is of opinion that the compression of the earth below the bottom of the machine continued without any considerable displacement until after a load of 4,000 or 5,000 lbs. had been applied, and that then the displaced earth found space in the adjoining earth until the load reached 7,000 or 8,000 lbs., when the uplift became visible at the surface of the ground; but that meanwhile the earth directly under the machine was continually more and more compressed in some proportion to the weight added. The small area pressed upon facilitated the escape of the material into the adjacent earth, which weighed only 300 or 400 lbs. per square foot. If the pit had been deeper, or the piston larger, there would have been less displacement.

The second set of experiments was made with the same machine, to the bottom of which was framed a strong base, 3 feet

square. The pit was sunk 2 feet deep into similar earth, and was 38 inches square both at the top and at the bottom. The stones were put on at intervals of an hour. There was no uplifting of the surrounding earth.

There was a remarkable regularity in the settlement as the load was increased, and a constant diminution of the increment as the earth became more compacted. The conclusion which Mr. M'Alpine came to was that the extreme supporting power of this earth was less than 6 tons per square foot, and that the load which might be safely imposed upon the clay was 2 tons per square foot.

For the purpose of maintaining the clay beneath the structure in the same condition of moisture, a deep puddle wall was extended entirely around the foundation, not only to exclude an excess of water, which might reach it through the veins and films of sand with considerable hydrostatic head, but also to prevent the egress of the natural moisture through similar veins. Although the puddle wall was carried up to the level of the terrace which surrounds the building, yet water might find its way along the face and down the outside of the walls, or possibly through some accidental break in the concrete floors within and surcharge the clay below. To prevent this, there was spread on the top of the clay, over the whole area enclosed, a depth of 6 inches of coarse screened gravel, the effect of which will be that under the great weight of the building any excess of water in the clay beneath will be forced into this pervious gravel, and flow off through it to the drains which encircle and traverse the foundations. The necessity for these provisions will be apparent when it is considered that many of the veins of sand extend to the surface of grounds of much greater elevation than the foundations, and that they communicate with imperfectly built street-sewers and water-pipes, while the same or other porous veins extend beneath the surface to grounds which are much lower. Through these sources the clay under some portions of the structure might be charged with water, while that under an adjacent wall might, at the same time, be drained of much of its natural moisture, and thus entirely destroy the design of a foundation which should everywhere have an equal sustaining power. It is not an absolute settlement which is to be apprehended, but a greater yielding in one place than in another.

A common practice of builders who have occasion to erect high and comparatively heavy towers and spires is to groove the lower part into the adjacent walls, so as to allow the heavier ones to slide in these grooves without breaking the bonding stones. In the present case the demands of the architect forbade the use of grooving, and hence the necessity for the above provisions.

The main walls of the building are from 5 feet to 7 feet thick where they rest upon the foundation walls, and bring upon them pressures of from six to nine tons per square foot, which had to be reduced to two tons per square foot on the clay. This was accomplished by projecting each of the footing courses beyond those immediately above them. The rule was to commence with a load of two tons per square foot upon the clay, three tons upon the top of the concrete, and generally four, five, six, or seven tons upon each succeeding course of stone. The weight on each lineal foot of the top of the foundation walls, divided by the above pressures, gives the exact width of each course of the footing stones, as shown in the table:—

Parts of the Building.	Load, per Lineal Foot.	Required Width of Courses.								Main Walls.
		Con-crete.	Courses of Footings.							
			1st.	2nd.	3rd.	4th.	5th.			
	Tons.	Ft. In.	Ft. In.	Ft. In.	Ft. In.	Ft. In.	Ft. In.	Ft. In.	Ft. In.	
Corner towers, front . . .	47	23 6	15 8	11 9	9 4	7 10	7 4	7 0		
"    "    rear . . .	39	19 6	13 0	9 9	7 10	6 6	5 6	6 5		
Curtains, front . . .	44½	22 3	14 8	11 1	8 11	7 5	6 5	6 5		
Central fronts . . .	50	25 0	16 8	12 6	10 0	8 4	7 2	6 5		
Partitions, four storeys	23½	11 9	7 10	5 11	4 9	3 11	3 5	3 0		
"    two    "	13½	6 9	4 6	3 5	3 0	—	—	3 0		
"    one    "	8½	4 3	2 5	2 2	2 0	—	—	2 0		

The large quantity of stone required in a short time—50,000 tons in four months—compelled a resort to a great many quarries, which furnished stones of different thicknesses, and made it necessary to modify the above exact arrangement; but the principle of the distribution of the load according to the vertical strength of the stone used was maintained throughout the foundations.

It was necessary to consider how far these projections could be made without danger of breakage of the projecting part of the stone. The pressure in this case tending to break the stone is that due to the weight on the wall above it, divided by the width of the wall and multiplied by the area of the projection, and to treat that result as a load distributed on a beam supported at one end.

To distribute the weight upon the footing stone courses with certainty, the beds of the limestone and granite were dressed to close parallel joints, so that the weight of each of the upper courses should be carried out to the extremity of the next course below. The vertical joints were only required to be quarry joints, not exceeding 1 inch wide. For certainty and convenience of laying the masonry, the foundation-stones were all required to be

rectangular blocks of from 18 to 24 inches in thickness; the breadth to be at least one and a half times the thickness, and the length two and a half times the thickness. The average size of all the stones was 31 cubic feet, equal to two and a half tons, and many of them were from five to eight tons weight. In the foundations of the main tower the average weight of the granite blocks was four tons, and of the projecting blocks seven tons. The footing courses were spread out equi-distant from the lines of the centre of gravity of the imposed weight above. The exterior stones of the three lower footing courses were all headers from 4½ feet to 7 feet in length. The longitudinal bonding was made by the interior stone, and in the upper courses, where the projections were smaller, by alternate headers and stretchers of the front stone, as well as the interior. The result of this bonding will be to distribute the weight and equalise its pressure upon the clay.

The weight of the main tower was so much greater than that of the other walls, and the earth below it so much inferior, that the foundation was placed 7 feet deeper than elsewhere. With this exception, all the walls were commenced at the same level. The spaces between the main exterior, rear and division walls, and under the arches of the central court, were covered with a layer of concrete, made of screened gravel and hydraulic cement, 1 foot to 2 feet thick.

### HOUSES IN HACKNEY.

THE annual report by Dr. Tripe, the Medical Officer of Health for the Hackney district, states that during the last year sanitary work had been more actively carried on in the district than in any year since 1866. In respect to dwellings which should be dealt with under the Artisans' Dwellings Acts, several were found. Some of these the owners preferred to turn into workshops rather than put them into repair for homes; others were pulled down, and others, which Dr. Tripe did not consider in all respects suitable for dwellings, were not reported under the Acts, as he did not find overcrowding, and the occupants, if they had not these cottages, would have to dwell in model dwellings, where they would have only one room for the price they paid for two or three in the cottages. He reported some properties in the Ridley Road as the worst houses in the district, and said that if these were not speedily pulled down it would be necessary to take measures to shut them up or get them properly repaired. He expressed his strong opinion that it was most unfair to the ratepayers that (under Sir R. Cross's Act) they should be compelled to pay for property which had been allowed to get into a dilapidated state through the want of substantial repairs as in the case of these uninhabitable houses. On the whole, the inspection had been very satisfactory, and many owners had done necessary work without any notice whatever being served upon them after his meeting them and pointing out what was necessary to be done. Of course, the alterations had not converted the old houses into new ones; but as the alternative was to drive the inhabitants elsewhere, thus causing overcrowding, he deemed it better that the people should be allowed to continue in the houses, especially as most of them had lived there many years. The dwellings, he added, occupied by the lowest class of poor are not very numerous in this district, and are not wrecked to the extent that some are in the centre of London. The inspections showed that many of the better class of houses were in a very unsatisfactory state, not only as regarded the water supply, but as to the danger which existed of infection by sewer gas. The total number of houses visited under the Nuisances Removal, Sanitary, and Metropolitan Local Management Acts was 7,993, or nearly one-third of all the dwellings in the district. There were also several workrooms inspected in which there were too many workpeople employed, and notices were served on the employers to abate the overcrowding.

### BUILDING IN DUBLIN.

THE following extraordinary statement by a workman has appeared in one of the Dublin papers as an illustration of the causes which have increased the price of building in that city. If it be true, it is no wonder that the estimates for the proposed museum have exceeded the contemplated amount:—

A contractor has a building in course of erection, and he for such orders a hundred thousand of bricks from some of the brickmasters in the locality where such are made. The price of the materials ordered, at a rough summing up, amounts to 300/. Through the dishonesty of the contractor's men in charge of the works, two-thirds alone of the whole amount are delivered to the buyer, thus leaving the contractor at 100/. loss on that transaction. Here is how the fraudulent schemes are worked. The brickmasters give their carters, when leaving their brickyards, dockets or invoices of their loading, stating what amount of bricks each driver has in charge. The signing of the invoices by the builder's foreman or clerk of works stands when returned to the brickmaster as a receipt of the goods delivered. Now, the signing of the invoices is managed thus. The foreman writes his name on

all the invoices presented to him for such, whilst he is fully aware there is one of every three horseloads, to use the trade term for such, "hobbed," that is, sold and delivered to some roguish purchaser at half-price or less. Half of the money procured by this scheme of robbery must find its way into the foreman's hands. If not, the fraud must cease.

The foreman then, and his dishonest accomplices, lavish their ill-gotten coin on the procuring for themselves and others drink and the foul sources of immoral pleasures. The plunder is not retained exclusively to the foreman and carters, but generally all hands engaged at the building have their share of the booty. So far is such carried that all sober and well-inclined workmen are almost completely "boycotted" by their fellow-workers. To express yourself averse to the robbery practised is to solicit dismissal on the Saturday evening following from the hands of the man in charge. This is how our mechanics can spend more than their honest income in the fetid backways of our city. All engaged at a building must, with the rarest exception, be supplied with beer-money by traders in lime, stones, and sand, &c. If not, the trader's goods, be they ever so free of defect, will be objected to by the hodmen and their fellow-conspirators. This raising of blackmail is one reason why building is costlier in Dublin than elsewhere. The robbing of building contractors by their employes and carters of brickmasters, &c., of 33 per cent. on the principal materials used, namely, bricks, stones, sand, and lime, must undoubtedly make building more expensive in Dublin than elsewhere, as the building contractors learn from bitter experience that materials are in the total very costly affairs. So to clear themselves of destructive loss they must raise their charges to intending employers to figures which will cover all expenses and leave a margin suitable to live on. They must so be 33 per cent. higher than legally required if honestly dealt by at the hands of their employers. Take the builders of anywhere else into comparison with them, and the great difference of prices is seen immediately. Not to give too much credit to the workmen and foremen of other places for honesty, we can plainly see 20 per cent. for robbery would even leave builders a good profit on the same amount of work. A fact I will now allude to will suffice to prove the evil effects of the fraudulent schemes spoken of to native industry. In one locality within four miles of Dublin, where a few years ago a dozen of brickyards were in full swing, there are now but two. The builders found the County Dublin bricks ran very short in work (from reasons the reader is already acquainted with), and so they now send their orders across the Channel. Irish working-men, and Dublin artisans in particular, should think of that.

### THE DESTRUCTION OF THE REFUSE OF TOWNS.

THE accumulations of refuse matter, such as garbage from markets, ash-bins, fish offal, and that from slaughter-houses, that daily accrues in our towns has for a long time past been a source of great trouble to the authorities, owing to the difficulties of disposing of it, as well as the cost of the process. Furthermore, these daily accumulations are a standing source of danger to the health of a locality; and, as our populations are constantly increasing, the difficulties of the problem are likely to assume a progressive ratio unless a ready means is found to eradicate the nuisance. Sanitary authorities have decided that burning in a furnace at a high temperature is the best means of overcoming the difficulty, and there are apparatus now in use that have been invented for the purpose. With the exception of a very costly apparatus in use in a few of our larger and more wealthy towns, and the expense of the erection of which places it out of the reach of the many, there does not appear to have been anything until recently invented that has secured a consensus of approbation from those interested in the question. It would appear, however, that the question is now in a fair way of being satisfactorily settled. Mr. J. E. Stafford, A.M.I.C.E., the Borough Engineer of Burnley, has recently invented a furnace which he has named the "Beehive Destructor," from its appearance assimilating to that of an aparian house. It is of the simplest construction, and may be constructed anywhere at a cost of about 100/., providing that it can be set up close to a chimney-stack such as is required for a steam-engine and boiler. But if the stack is not attainable it will be necessary to erect one. We append an illustration showing a front view of the apparatus. It is simply a furnace fed with the refuse at the side by means of a door running on rollers, with a water tank underneath the furnace in front into which the ashes fall, the steam or vapour given off by the water tending to keep the bars of the furnace cool, and so prolonging their wear. One of these destructors has been in use in Burnley for some months past, where it has been burning the refuse at a cost, including all charges, of about tenpence per load. Matter of the most heterogeneous character, even to the contents of middens representing human excreta, combined with ashes, have been consumed, and not the slightest offensive smell has been given off during the process. The residuum, after burning, is very small, and mainly consists of a fine dust adapted for mixing with mortar, and a hard clinker suitable

for the underlying for roads. Although in the midst of a stone district, Mr. Stafford informs us that rubble suited for the bedding of the roads costs from 3s. 6d. to 4s. per load. It will be seen from these remarks how great has been the gain in the removal of nuisance, while the cost of scavenging in the town of Burnley, which has averaged during the past five years 1,600% per annum, has been reduced to a sum since the introduction of the destructor that the most sanguine could have scarcely anticipated.

A few days since we received a request to visit Richmond, where two of the "Beehive" destructors have been erected in the Corporation Yard at New Richmond, under the direction of Mr. Lomas, the London agent of Messrs. Bortwistle & Co., of Burnley, the makers of the apparatus. Great credit is due to the authorities of the charming Surrey town for the step they have taken, in which they have set an example to all other places within the metropolitan area that they may follow with economy and advantage. A fine stack some 90 feet high has been erected, having a square base, and at the opposite ends two destructors have been erected, our illustration showing the front view. It is 7 feet in diameter and 7 feet high, built entirely of fire-brick, and the bricks composing the stack have all been sent from Burnley, Mr. Lomas not having been able to obtain bricks in London suitable to the purpose.

Some astonishment was created at Richmond by the manner in which the stack was erected, being built by the workmen sent from the north from the inside, without scaffolding—a thing almost unknown south of the Midland district. We have now only to add that the destructors are doing their work at Richmond to the satisfaction of the authorities, and to the evident advantage of the neighbourhood. Considering the price of coal at Richmond and the cost of labour in the metropolitan area, we cannot expect the economic feature to come out quite so advantageously as in northern towns, where both fuel and labour are so much cheaper. But if we look at the corresponding cost under the old system, the advantages are in proportion; and sufficient is already known to warrant the authorities in saying that they have entered upon a wise and economical undertaking. We may add that the entire cost of the work has not exceeded 450%, and that if other two destructors are eventually required to fill up the square they will be erected at about 100% each.

#### Correspondence

**New Cathedral, Liverpool.**  
SIR,—When the advertisement inviting members of the profession to send in portfolios of designs first appeared in your paper, it was, I think, very generally felt that the committee for the proposed cathedral were honestly seeking the best means of stirring up and bringing to the front some of the genius of the profession, which no one can doubt lies beneath the mere surface of opportunity and success. This feeling was further encouraged from the fact that the most representative member of the profession, "the President of the Institute," was selected as "consulting architect" to the committee. But what are the results of this new and well-intentioned method of competition? Surely they are far from satisfactory. In the very short notice giving the result of this important competition, we are told that out of the one hundred and one architects who sent in portfolios, Mr. Ewan Christian recommended twelve names for the consideration of the committee, a number which, it must be allowed, is very fairly proportionate. The committee, however, only select four gentlemen to supply "sketch designs" out of the twelve recommended. No one can, of course, question the thorough ability of the four gentlemen thus selected, whose names have been, for so many years familiar to those interested in ecclesiastical art; but surely in a work of

such great importance it would not be too much to ask that the twelve, or a majority of the twelve, architects recommended should have been invited to send in "sketch designs." This, however, seems to have been a far too liberal course for the very liberal cathedral committee, who have contented themselves with returning the portfolios "unpaid" to their owners, accompanied with a printed form of thanks, but without giving any intimation as to the names of the twelve architects recommended or the general result. In common justice to the eight unnamed architects, who had the honour of being recommended by Mr. Christian, and for the benefit of the profession in general, I do hope that those names will be duly announced.

The recommendation, coming as it does from an eminent member of the profession, is of consequence to all concerned. The final selection made by an amateur committee surprises no one, as the names chosen are naturally names that are well known to all. No one will, I think, complain of the names selected; but many will feel, under the circumstances, that more than double the number should have been invited to send in "sketch designs."

September 9, 1884.

Yours truly,  
SUUM CUIQUE.

#### GENERAL.

**Mr. A. W. Turner**, second master in the Derby School of Art, has been appointed head master to the York School of Art.

**An Art and Industrial Exhibition** will be opened at Newbury on Monday next.

**A Memorial Pulpit**, designed by Mr. Chatwin, of Birmingham, has been presented to Aston Church by Mr. J. Yates, of that town.

**Mr. James Lessels** has been appointed architect to the Edinburgh Improvement Trust, in succession to his late father.

**Mr. W. S. Allen, M.P.**, has offered a site to the Corporation of Newcastle-under-Lyme for the proposed new baths and free library, for the sum of 1,400%, which is equivalent to a gift of 500% to the undertaking.

**A Piscina** has been discovered during the removal of the south gallery in the Manchester Cathedral, in that portion of the edifice known as the Trafford Chapel. Its existence had not previously been suspected, for it was covered entirely by a thick coating of plaster.

**A New West Window** for Ripon Minster has been decided on as a memorial of the late Bishop of Ripon.

**Mr. G. Gibbons**, of Bath, has obtained a bronze medal and honourable mention for plans of farm buildings exhibited at the Amsterdam Exhibition.

**Application has been made** to the First Commissioner of Her Majesty's Works for the loan of the drawings which were submitted in the second competition for the new Admiralty and War Office buildings, for the purpose of placing them on view for a short time in the Edinburgh Museum of Science and Art.

**Funds are to be raised** immediately for the erection of a new church for Fairfield parish, Buxton.

**The Paisley Town Council** on Tuesday decided to delay the consideration of proposals regarding the site of the new municipal buildings, and in the meantime to instruct the measurer to fill up the schedules of the cost of the buildings.

**The Teddington Local Board** have decided on the desirability of constructing a bridge over the Thames at Teddington, and so opening one of the finest promenades on the Surrey side of the river to the public generally.

**The Trades Union Committee**, in the report which was read at Aberdeen, express regret that so little progress was made with the Employers' Liability Amendment Act. They have increasing evidence of the necessity of preventing employers contracting out of the Act of 1880. As showing the working of this Act, they state that 343 actions were brought in county courts last year. Damages were obtained in 116 cases, the total sum being 9,242%, and the average 79%. Fifty cases were withdrawn and settled out of court.

**The American Elevator Co.**, of 38 Old Jewry, E.C., have just received the contract for one of their "Standard" hydraulic lifts for passenger service, and especially for the use of invalids, to be erected in the London Temperance Hospital, Hampstead Road. The car will be so constructed as to admit a cot bed containing a patient, thus enabling the inmates of the hospital to be moved from place to place with great facility.

**Penally.**—The ancient church of Penally, so well known to holiday visitors to Tenby, has been reopened after restoration of the interior. The floor has been laid with encaustic tiles, and the whole series of six windows have been filled with stained glass. The east window, which was in very bad condition, has also been restored, and the church lighted with the Hesperus lamp, the whole of the work having been carried out satisfactorily by Messrs. Jones & Willis, of Birmingham and London.

DESIGN FOR ADMIRALTY & WAR OFFICES

[ WHITEHALL FRONT ]

BY MESSRS GLOVER & SALTER

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, SEPTEMBER 13, 1884.

### COMPETITIONS OPEN.

**BIDEFORD.**—Sept. 22.—The Trustees of the Bideford Bridge Trust invite Competitive Designs for the Erection of a Block of Buildings suitable for a Post Office on site of Premises in High Street. Premiums of 20*l*. and 10*l*. The cost of carrying out any of the Designs not to exceed 800*l*.

**BOMBAY.**—Nov. 6.—The Municipal Commissioner of Bombay invites Designs and Estimates for a New Municipal Hall and Offices, which must be sent to his Office by Twelve noon, on Nov. 6. A Premium of 5,000 rs. will be given for the Design most approved of by the Commissioner, with the assistance of a Committee of the Corporation; 3,000 rs. for the second, and 2,000 rs. for the third. The total cost of the buildings is not to exceed 5 lacs (5,00,000 rs.). Mr. E. C. K. Oliviant, Municipal Commissioner's Office, Bombay, or at Messrs. E. W. & R. Oliver, 1 Corbet Court, Gracechurch Street, London.

**REDRUTH (CORNWALL).**—Sept. 13.—*School.*—The Redruth School Board offer a Premium of 25*l*. for the best Plans (Elevation and Detailed Drawings), to be selected by themselves, for a School, to be erected at Trewirgie, Redruth, to accommodate 700 Children (350 Boys and 350 Girls and Infants). Total cost not to exceed 3,500*l*. Mr. Charles Bawden, Clerk, Heanton Place, Redruth.

**STOCKPORT.**—Oct. 1.—Designs are invited for Public Baths. Premiums of £50, £30, and £20. Mr. Walter Hyde, Town Clerk, Stockport.

### CONTRACTS OPEN.

**AIRDRIE.**—Sept. 22.—For Erection of Railway Station Buildings. Mr. John Strain, C.E., 154 West George Street, Glasgow.

**AYR.**—Sept. 15.—For Construction of Section of Tramway from Ayr to Prestwick. Mr. J. Macrae, C.E., 107 Prince's Street, Edinburgh.

**BELFAST.**—Sept. 16.—For Building Boiler-house, Coal-house, &c., at the Workhouse Infirmary. Mr. J. C. Neeson, Union Workhouse, Belfast.

**BLYTH.**—Sept. 27.—For Restoration of Church. Mr. C. Hodgson Fowler, Architect, The College, Durham.

**BROXWOOD.**—For Building Small Church and Presbytery. Mr. C. F. Hansom, Architect, Clifton, Bristol.

**BURY.**—Sept. 15.—For Building Woollen Mill at Hudear. Messrs. Sellars & Hamilton, Architects, Union Chambers, Bury.

**CATERHAM.**—Sept. 18.—For Stone Stair and other Builder's Work. Mr. W. Crickmay, Resident Engineer, Caterham Asylum for Imbeciles.

**CLEGGAN.**—Sept. 24.—For Construction of Basin, Wharves, Groin, Extension of Pier, Deepening Harbour, &c. Mr. W. B. Soady, Secretary, Office of Public Works, Dublin.

**DARLINGTON.**—Sept. 29.—For Building Board Schools in Beaumont Street. Mr. F. W. Brooks, Architect, 40 High Row, Darlington.

**DEWSBURY.**—Sept. 15.—For Building Five Houses, Savile Town. Mr. H. Holton, Architect, Bond Street, Dewsbury.

**EDMONTON.**—Sept. 15.—For Building Six or Twelve Houses. Messrs. Whitmore & Reeves, Architects, 14 Devonshire Square, Bishopsgate, E.C.

**FENTON.**—Sept. 20.—For Building Twelve Houses and Shop. Messrs. R. Scrivener & Sons, Architects, Howard Place, Hanley.

**FORMBY.**—For Building Villa Residences. Messrs. Andrews & Titmas, Architects, 48 Arcade Chambers, St. Mary's Gate, Manchester.

**GLASS.**—Sept. 13.—For Building Dwelling-house. Messrs. Matthews & Mackenzie, Architects, 255 Union Street, Aberdeen.

**GORLESTON.**—Sept. 17.—For Building House and Shop. Mr. W. B. Cockrill, Architect, Glencoe House, Gorleston.

**HALIFAX.**—Sept. 15.—For Building Four Cottages and Additions to House, Booth Town. Messrs. Utley & Gray, Architects, Waterhouse Street, Halifax.

**HAMMERSMITH.**—Oct. 2.—For Rebuilding Superstructure and Strengthening Hammersmith Bridge, Construction of Temporary Bridge, &c. Sir J. W. Bazillette, Spring Gardens, S.W.

**INVERURIE.**—Sept. 13.—For Erection of Buildings at Inverurie Mills. Messrs. Jenkins & Marr, Architects, 16 Bridge Street, Aberdeen.

**IPSWICH.**—Sept. 16.—For Building Beard School for Infants, Rose Hill. Mr. E. F. Bisshopp, Architect, Museum Street, Ipswich.

**KIRKSTALL.**—Sept. 20.—For Stone Boundary Wall, Entrance Gateways, Piers, and Iron Gates to Burial Ground. Mr. T. Winn, Architect, 18 Park Lane, Leeds.

**KNOCKADOON.**—Sept. 17.—For Construction of Boat Slip and Platform, Rock Excavation, &c. Office of Public Works, Dublin.

**LEEDS.**—For Building Two Houses. Mr. D. Dodgson, Architect, 18 Park Row, Leeds.

**LEE.**—Sept. 25.—For Construction of Brick Sewer (4,200 feet), Grove Park. Metropolitan Board of Works, Spring Gardens, S.W.

**LIMERICK.**—Sept. 22.—For Building the St. Vincent of Paul National School. Messrs. Nash & Son, Land Agents, 85 George Street, Limerick.

**MANSFIELD.**—Sept. 15.—For Building Detached Cottage, Nottingham Road. Mr. R. Frank Vallance, Architect, Mansfield and Nottingham.

**MATBOLE.**—Sept. 16.—For Construction of Sewers. Mr. R. C. Brebner, C.E., 122 George Street, Edinburgh.

**NEWCASTLE-ON-TYNE.**—Sept. 30.—For Clearing Site and Building Offices for the Tyne Improvement Commissioners. Mr. J. J. Stevenson, 18 Queen's Road, Bayswater, W.

**PERTH.**—Sept. 26.—For Enlargement of the General Station. Messrs. Blyth & Cunningham, C.E., 135 George Street, Edinburgh.

**STRATFORD.**—Sept. 23.—For Building Police Court and Offices. Mr. Lewis Angell, C.E., Town Hall, Stratford, E.

**STROUD.**—Sept. 20.—For Building Post-Office. H.M. Office of Works, 12 Whitehall Place, S.W.

**SWANSEA.**—Sept. 16.—For Additions to Tirdewnaw School. Mr. E. Sidney Hartland, Clerk to the School Board, 5 Rutland Street, Swansea.

**TODMORDEN.**—Sept. 26.—For Construction of Reservoir, Ramsden Clough. Mr. James Farrar, C.E., Market Street, Bury.

### TENDERS.

#### ABERDEEN.

For Building Two Houses in Grosvenor Place, Aberdeen. Messrs. ELIAS & WILSON, Architects. Quantities by the Architects.

Smith, mason.  
Murray & Co., carpenter.  
Wilson, slater.  
Mason & Findlay, plasterer.  
Matthews, plumber, gasfitter, &c.  
Whyte, painter and glazier.

#### BURGESS HILL.

For Alterations, &c., at Abbotsford, Burgess Hill, Sussex. Mr. ARTHUR LOADER, Architect, Brighton.

Lockyer, Brighton	£313	0	0
Norman, Burgess Hill	276	0	0
WILSON, Brighton (accepted)	259	0	0
Water-Supply.			
Norman	149	0	0

AWARDED SEVEN PRIZES FOR SUPERIORITY, INCLUDING PARIS GRAND MEDAL, 1878, THE CERTIFICATE OF MERIT OF THE SANITARY INSTITUTION OF GREAT BRITAIN, AND THE AWARD OF MERIT AT THE INTERNATIONAL EXHIBITION, 1881.

TO ARCHITECTS.—THE BRICK of the FUTURE, that shall not get dingy or sooty like other Bricks, but, being of a Semi-Vitreous nature, will maintain a clean and washable surface.

## FACING BRICKS AND BRICK ORNAMENT OF TRUE TERRA-COTTA, AS ALSO ARCHITECTURAL WORK, IN WHITE AND WARM-TINTED BUFF.

Made from the Finest Terra-cotta and Stoneware Clays, of a warm and pleasing appearance, of beautiful and superior quality and finish, non-absorbent, acid, fire, and alkali proof, will resist the most severe frosts, and when tested were found to withstand a pressure of 445 tons to the square foot. They have been used in the most exposed parts on the North and South Coasts, and being true Terra-cotta, are warranted imperishable.

Pattern Sheets and Price Lists of superior Glazed Stoneware Sanitary Pipes, and Fire Clay Goods, Chimney Tops, &c., on application.

Sole Manufacturers:—CANDY & CO., Limited, GREAT WESTERN POTTERIES, NEWTON ABBOT, AND 11 QUEEN VICTORIA STREET, LONDON, E.C. Who are also Sole Makers of the celebrated "Granite Vitrified" Paving Bricks for Yards, Stables, and Footpaths, and "Granite Vitrified" Damp-proof Building Bricks, as used by H.M. Government for dock construction, &c. Samples free to Architects and Engineers.

## AUDENSHAW.

For Gate Piers, Boundary Walling, Tool Shed, Closet, and Fixing Palisades, for St. Stephen's Church, Audenshaw. Mr. J. H. BURTON, Architect, Ashton-under-Lyne.	
Fielding, Dryolsden . . . . .	£617 13 4

S & W. M. Chadwick, Ashton-under-Lyne . . . . .	554 0 0
Crackston, Ashton-under-Lyne . . . . .	527 6 0
CARSHAW, BARNES & Co., Stalybridge (accepted) . . . . .	483 10 0
Hirst, Haughton . . . . .	462 19 0
Woodhead, Ashton-under-Lyne . . . . .	419 14 7

## BELFAST.

For Supply of 1,262 tons of Cast-iron Pipes, ranging from 4 to 12 inches in diameter.	
Stanton Ironworks Co., Nottingham . . . . .	£7,166 12 6
J. & T. Roberts, West Bromwich . . . . .	8,849 3 8
Stewart & Co., Glasgow . . . . .	6,832 1 4
Cochrane & Co., Dudley . . . . .	6,732 0 8
McFarlane, Strang & Co., Glasgow . . . . .	6,696 6 0
McLaren & Co., Glasgow . . . . .	6,632 14 5
Spittle (Limited), Newport . . . . .	6,644 0 5
Edington & Sons, Glasgow . . . . .	6,639 14 3
LAIDLAW & SON, Glasgow (accepted) . . . . .	6,598 8 0

## BRIGHTON.

For New Front to 46 Preston Street, Brighton. Mr. ARTHUR LOADER, Architect, Brighton.	
Kemp . . . . .	£320 0 0
Hackman . . . . .	254 10 0
Taylor . . . . .	210 0 0
LOCKYER (accepted) . . . . .	236 0 0
For Sinking Well, Building Engine House and Coal Store, Fixing Engine and Pump, at Pumping Station, Patcham, Brighton. Mr. EDWARD EASTON, C.E., Engineer, 11 Delahay Street, S.W. Quantities by Mr. B. H. Nunn, Queen's Road, Brighton.	
Tilley & Sons, London . . . . .	£1,030 10 0
Taylor, Reigate . . . . .	976 0 0
Brown, Tottenham . . . . .	855 0 0
Longley, Crawley . . . . .	629 0 0
HARRISON (accepted) . . . . .	570 0 0
Engine House, Engine, &c. . . . .	
REED & SON (accepted) . . . . .	2,125 0 0

## BURTON-ON-TRENT.

For Pipe Laying in connection with the Sewerage Works, Burton-on-Trent.	
McKAY, Stoke (accepted) . . . . .	£4,738 8 9

## CARDIFF.

For Erecting New Galleries to the English Baptist Chapel, Longcross Street, Cardiff. Mr. J. P. JONES, Architect, 27 Park Street, Cardiff.	
Shepston & Sons . . . . .	£615 16 0
Gray . . . . .	457 0 0
Thomas & James . . . . .	450 0 0
Jones Bros. . . . .	445 0 0
Lock (accepted) . . . . .	421 0 0
Bridgeman . . . . .	390 0 0

## CARSHALTON.

For Billiard Room for Mr. J. H. Davis, Cressingham House, Carshalton, Surrey. Mr. THOS. L. HEWARD, Architect, 7 John Street, Bedford Row, W.C.	
Howe & White, Wallington . . . . .	£370 0 0
Potter, Sutton . . . . .	333 0 0
Smith & Bence, London . . . . .	347 0 0
Hazell, Beddington . . . . .	350 0 0
Evans, Carshalton . . . . .	309 0 0
Clarke, Wallington . . . . .	298 0 0
ALDOUS, Carshalton (accepted) . . . . .	250 19 0

## COLCHESTER.

For Erection of Fourteen Cottages, Colchester. Mr. F. E. MORRIS, Architect, West Stockwell Street.	
Everett & Son, Colchester . . . . .	£1,680 0 0
Eade & Leaden . . . . .	1,439 0 0
Smith, Wyvenhoe . . . . .	1,369 0 0
Shepherd, Colchester . . . . .	1,358 0 0
Gladwell, Colchester . . . . .	1,358 0 0
AMBROSE, Colchester (accepted) . . . . .	1,314 0 0

## CORK.

For Building Twenty Houses, for the Cork Villa and House Company. Mr. ROBERT WALKER, Architect, 17 South Mall, Cork. Quantities supplied.	
Martin . . . . .	£9,091 8 0
Roberts . . . . .	8,800 0 0
T. O'Flynn . . . . .	8,746 5 5
Fitzgerald . . . . .	8,256 0 0
E. & P. O'Flynn . . . . .	8,235 0 0
Hill . . . . .	7,825 0 0
DELANEY (accepted) . . . . .	7,786 0 0

## CROYDON.

For Works at the Church of St. Mary Magdalene, Croydon. Mr. D. R. DALE, F.R.I.B.A., Architect.	
HOARE & SONS (accepted) . . . . .

GRUNDY'S PATENT

WARM-AIR

VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent  
consist in the heating surface being greater than any  
other Fire-grate introduced to the public. It is very  
simple in construction, and is made in the form of a Stove,  
the back of which is semicircular in shape, with gills  
behind and smoke-nozzle on top, all cast in one piece.  
The same can be attached to any design of a Register or  
Stove front. It is very suitable for schools, class-rooms,  
waiting-rooms, hospitals, offices, dormitories, and dwelling-  
houses, from the cottage to the mansion. Design and  
specification post free on application.

TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"Sir,—I have much pleasure in testifying to the  
efficiency of your patent Warm-Air Fire Grate. It has  
been very successful, and given every satisfaction where I  
have used it.

"Yours, &c.

"JAMES WEIR, F.R.I.B.A.

"To Mr. Grundy."

"Baptist Chapel, Clapham Common, London. Richard  
Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the  
excellency and efficiency of your patent Fire-Grate. It is  
the most charming invention for heating a large room I  
have ever known. I shall have pleasure in showing it to  
anyone who wish to have their schools or rooms pleasantly  
and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,  
July 1884.

"DEAR SIR,—I have very great pleasure in stating that  
the first stove, or patent warm-air ventilating fire grate,  
adopted by me in school at Seaton, and a second in a  
Cocoa Palace, have given such satisfaction that I now  
order eleven to be inserted in New Upper Grade Schools in  
course of erection at West Hartlepool. They are the most  
economical, efficient, and easily managed stove at present  
before the public.

"Mr. John Grundy."

# BELL'S ASBESTOS.

## BELL'S ASBESTOS FLOORING FELT.

This article is manufactured from specially prepared Asbestos fibre, and by its use any building can be rendered comparatively fireproof at a very small cost. This material should be used as a substitute for brown paper under the carpet, and it can be taken up and relaid as often as required; it may be laid between the flooring boards, on the ceiling before plastering, and on the walls. Doors of pine or other wood should be so constructed as to have a sheet of the felt in the centre, so that either side being burned the other remains intact. In houses so protected fires would be localised to the rooms in which they originate. Asbestos felt, being a non-conductor of heat, is superior to any other sheathing, and used under slates has no equal. It yields no dust, lies quite flat, is soft to the tread, and its low cost places it within the reach of everybody. Made in rolls of 36 inches wide.

**BELL'S ASBESTOS BOILER AND PIPE COVERING COMPOSITION** for coating every class of steam pipe and boiler. Non-combustible, and easily applied when steam is up; adheres to metals and preserves them from rust; prevents the unequal expansion and contraction of boilers exposed to weather; covers 50 per cent. more surface than any other coating, and is absolutely indestructible. It can be stripped off after many years' use, mixed up again with 20 per cent. of fresh, and applied again. The composition is supplied dry, and only requires to be mixed with water to the consistency required for use.

A horizontal boiler, 17 ft. 6 in. long, 15 H.P., gave the following results:—

Temperature on Plates .. .. .	186 deg.
"          Covering .. .. .	94 "

One ton of coal was saved per week, and, although the fire was raked out every evening 20 lbs. of steam were in the boiler next morning.

The following testimonial refers to this covering:—

Offices of Wimbledon Local Board, Wimbledon, Nov. 28th, 1883.  
Dear Sir,—It may interest you to know that we save exactly 40 per cent. in fuel through using your covering.—Yours truly,  
W. SANTO CRIMP, C.E., F.G.S.

**BELL'S ASBESTOS PAINT**, for floors, stairs, and all interior woodwork, to prevent the spread of fire. This paint is especially useful in cotton mills, and in fact in all factories and buildings exposed to risk from fire. It is quite free from poisonous ingredients, and is both easily and cheaply applied. Bell's Asbestos Paint has, on several occasions, done great service in preventing the loss of life and property. The great fire in Buchanan Street, Glasgow, in November last, produced the following testimony to the value of this material:—

Offices of the *Glasgow Herald*, the *Weekly Herald*, and the *Evening Times*, Glasgow, Nov. 14th, 1883.  
Mr. John Bell,  
Sir,—As one of the means that helped to save our buildings extending from Buchanan Street to Mitchell Street from the recent great fire, I think it fair to say that your Asbestos Paint, which was applied to the outside hoist of the *Evening Times* case-room and other portions, gave valuable proof that it materially aided in resisting the flames from the immediately adjoining tenement while the fire was rapidly destroying it and threatening us in the most serious form. Since the fire, and to assure myself further of the value of the Asbestos Paint as a fire-resister, I placed a piece of wood, with your paint put on more correctly than in our case, into one of our furnaces, with the result that it was brought out without a fibre of the wood being touched, while similar pieces of wood, thrice coated with Irish Lime, at once got into a flame.—Yours truly,  
(Signed) ALEX. SINCLAIR.

**BELL'S ASBESTOS SASH-LINE CORD** is unaffected by heat and damp, and renders unnecessary the use of metallic wire and chains. Ropes made in the same form have great tensile strength, and being indestructible by fire are of incalculable value for fire escapes.

## BELL'S ASBESTOS.

The goods of this house are of the highest quality only, and no attempt is made to compete with other Manufacturers by the supply of inferior materials at low prices. All orders must be sent direct to the undermentioned depots, and not through agents or factors.

**BELL'S ASBESTOS AND INDIA-RUBBER WOVEN TAPE AND SHEET.**—ING for making every class of steam and water joint. It can be bent by hand to the form required, without puckering, and is especially useful in making joints of manhole and mudhole doors on boilers; also for large "still" joints, where boiling fat and steam have to be resisted. It is kept in stock in rolls of 100 feet, from 1-in. to 3-in. wide, and any thickness from 1/8 in. upwards. Manhole covers can be lifted many times before the renewal of the jointing material is necessary. The same material is made up into sheets about 40 in. square, and each sheet bears the trade mark, without which none is genuine. It is very necessary to guard against imitations of this useful material, and to secure themselves against being supplied with these less useful articles at my price, users are recommended to see that every 10-ft. length of the Asbestos Tape purchased by them bears the trade mark.

**BELL'S ASBESTOS CEMENT** for the backing of firebricks and furnaces. The use of this fireproof material saves the expense and annoyance occasioned by the repairs so constantly required in the firebricks and kitchen ranges of private houses. Any labourer accustomed to handle other cements can apply this.

**BELL'S ASBESTOS BOILER PRESERVATIVE.**—This useful mixture, by absorbing the free oxygen that is in the water, entirely checks pitting and corrosion. It also disintegrates incrustation so immediately as to prevent its adhering to the plates. Not only is a great economy of fuel effected by keeping boilers clean, but the risk of having the plates burned is thereby obviated. It has been computed that 1-16th inch thick of incrustation causes a waste of 15 per cent. of coal; 1/8 inch thick, 60 per cent.; and 1/4 inch, 150 per cent. Thus the Preservative avoids the great risks which are inseparable from scaled plates, lengthens the life of a boiler, and covers its own cost a hundredfold by economy of fuel. It is entirely harmless, and has no injurious action on metals. It can be put into the feed tank or boiler, as may be most convenient. Sold in drums and casks bearing the trade mark, without which none is genuine.

**BELL'S PURE ASBESTOS CLOTH**, for protection against the spread of fire. Iron curtains warp, and in the great emergency of fire will often be immovable. Asbestos cloth, being incorruptible, will remain strong and flexible for an indefinite period, and will stay the progress of a fire and the passage of smoke longer than any other known material. This cloth is also extensively used in Maignen's unequalled water filters, for which a gold medal and diploma of honour were awarded by the Special Commission appointed by Her Majesty's Government to receive the reports of the International Juries at the Fisheries Exhibition. By special arrangement with Mr. Maignen, his filters for houses, factories, and towns are supplied by this firm.

**BELL'S ASBESTOS BLOCK GAS FIRES.**—The Asbestos Block Gas Fire is formed by placing inside the ordinary grate a hollow block (burner), composed of Asbestos, and perforated. An iron sole-plate, with a single gas burner, is fixed at the bottom of the block. After being lighted a short time, both the block and asbestos fuel throw out intense heat.

**BELL'S ASBESTOS FUEL** for gas fires. This genuine Asbestos Fuel is composed of the finest hand-picked Asbestos, and its weight is about half that of any other Asbestos fuel.

**BELL'S SPECIAL LONDON-MADE ASBESTOS MILL-BOARD**, for dry steam joints, made of the best Asbestos fibre, is well-known for its toughness and purity, and is absolutely free from the injurious ingredients frequently used to obtain an appearance of finish, regardless of the real utility of the material. Made in sheets measuring about 40 in. square, from 1-64th in. to 1 in. and 1/2 millimetre to 25 millimetres thick. Each sheet bears the Trade Mark.

DEPOTS:—118A SOUTHWARK STREET, S.E.; VICTORIA BUILDINGS, DEANS GATE, MANCHESTER; 11 & 13 ST. VINCENT PLACE, GLASGOW;

39 MOUNT STUART SQUARE, CARDIFF; 21 JITTER STRASSE, BERLIN.

# EASTWOOD & CO. (LIMITED).

LIME, CEMENT, AND BRICK MANUFACTURERS.

**SHOEBURY, COWLEY, & KENT BRICKS IN ANY QUANTITY DELIVERED ALONGSIDE**

Shoebury Malm Facings and Paviers.	Dutch, Adamantine, and Red English	Laths, Plaster.	Ridge Tiles, Terminals, &c.
Sourbridge, Welsh, and Newcastle Fire	Clinkers.	Moulded Bricks of all kinds.	Staffordshire Blue Bricks.
Bricks, &c.	Red and White Suffolk Bricks.	Red, White, and Black Rubbers.	Chimney Pots, Slates.
Glazed and other Drain Pipes.	Greystone, Blue Lias, and Chalk Lime.	Broseley and Yorkshire Roofing Tiles.	Hair, Sand, &c. &c.

# PORTLAND CEMENT

(WELLINGTON BRAND) of Unsurpassed Quality.

Sole London Consignees of Messrs. Gibbs & Co.'s (West Thurrock) PORTLAND CEMENT, and the LUMLEY GLAZED BRICKS.

**BRICKFIELDS:—WEST DRAYTON, MIDDLESEX; SITTINGBOURNE, KENT.**

**WHARFS:—**

WELLINGTON WHARF, BELVEDERE ROAD, LAMBETH.  
CANAL BRIDGE WHARFS, OLD KENT ROAD, S.E.  
CHELSEA WHARF, LOTTS ROAD, CHELSEA.

KENSAL GREEN, HARROW ROAD.  
VICTORIA WHARF, MORTLAKE, S.W.; and  
BLACK HORSE LANE, RICHMOND.

# The Architect.

## THE DEVELOPMENT OF DOMESTIC BUILDING.

AMONGST other things which the advance of scientific research in these days may suggest to the inquiring mind, is the principle of the organic development of domestic building. Speaking roundly, all things whatever are now pretty well understood to be necessarily subjects of development, under the strict reign of law; nothing comes by haphazard or caprice, adventure or misadventure; nothing exists except as an adequate effect of causes past, and no less an adequate cause of effects future; and

they who can read the language of building-construction and building-art cannot help seeing that in both these respects there is a definite course of progress to be traced, in all cases of sufficient importance, whereby the typical character of our dwellings has changed by steps as years have rolled on, and has so changed, as a general rule, always in very much the same direction. The architectural tourist who at this season is engaged in contemplating and sketching the remains of old times in many a quaint city and village abroad and at home, may find everywhere illustrations of this, and if he cares sometimes even to sketch a little less, perhaps, in order to think a little more, he may find a profit in it.

Not long ago, Mr. BERESFORD HOPE, in making some observations at the Health Exhibition on the interesting representation of a street of Old London, which amuses the visitors so pleasantly, pointed out with his customary force how the illusion might be made much more emphatic if, instead of the smooth, level boarding of the counterfeit thoroughfare, Mr. BIRCH could have introduced some piquant kind of pebble paving, neither smooth nor level, characteristically littered with a variety of scarcely savoury or salubrious refuse, and along the centre formed a running gutter almost less savoury and salubrious still. The speaker might have added that the demeanour of the citizens occupying the houses, and of those passing by, as well as their choice of language and their subjects of conversation, must none the less have been materially modified from the usages of the present day if the simulation were to be more complete, and that a great deal more besides in the way of dress and equipment, tone and temper, was very different indeed in the old days from what we see in the new. But even the most minute comparisons of this kind would not have accomplished an exposition of the scientific principle before us; for the architectural archæology of our day is still too much occupied with superficialities, and it is not always so easy to get below the surface as it ought to be. The story that is told by the houses of successive generations in an old town, if taken with strict reference to building characteristics alone, is an extremely curious story, and one that is in a certain way more curious even than the corresponding history of the people who built the houses and who lived in them. No doubt the character of those old folks and of their doings gave character in a general way to their buildings; but in a special way it is the builder rather than the dweller whose personality the building has always been governed by, just as in our own day it is the architect and not the mere owner or paymaster whose idiosyncrasy is manifested.

The anachronism of the imitation of antiquity which English architects so much indulge in becomes very apparent when we take up this line of thought. Not only does an English family of the eighteen hundred and eighties require to modify its arrangements considerably when settling down in a new house which has been built too successfully on the model of the fifteen or sixteen hundreds, but the whole spirit of both construction and design must be compromised in the imitation almost still more notably. Properly speaking, however, our building simulations of this kind, in spite of all the pains we take, are only superficial simulations after all, in which the outer skin is so far antique, but the inner organisation wholly modern; and were it not for this, indeed, even the most eccentric people could not possibly occupy them.

Perhaps it is in the article of plan that the progress of domestic architecture is most remarkable. We have only to look at any example, for instance, the Elizabethan, or even the Stuart period, which happens by accident to have been kept sufficiently unsophisticated, and the perfect impossibility of accommodating a family of the present day in such unorganised congeries of apartments is at once manifest. Compare it with a new house which has been what is called designed in the Elizabethan or Jacobean style, and, however carefully the designer may have imitated the ancient artistic character, the arrangement of the rooms is seen to be altogether different; or we ought rather to say the rooms themselves are altogether different rooms, and they are only dressed more or less in masquerade. Nor is it difficult to the initiated to trace step by step the course of progress from the one spirit to the other spirit, one generation improving the work of another upon a perfectly systematic principle. Domestic plan, in a word, has scientifically developed itself in the interval, so that the English house of the one date and the same English house (so to speak) of the other date are two houses as entirely unlike as the Greek temple and the Gothic church. And there are two points, as we think, not generally noted here; first, that this development of character, as matter of fact, includes with the article of plan the whole province of construction and artistic grace; and again, that the very operation of development is the act of a professional class, and not of what we nowadays call the public. Indeed, it is matter of wonder that even at present, when the amateur is rampant, the effect of general lay opinion, whether public opinion or private, should be in architecture so very insignificant as it is. There is an absurd formula of speech very much used by archæologists whereby the building of historical edifices is attributed to historical magnates, such as kings, bishops, and nobles, in such a very personal way that it would seem to be believed that the artistic and scientific direction of the workmen was actually conducted by those personages as it would be in our day by professional architects, just as if it were to be said that Queen VICTORIA built in her earlier days the Brompton Boilers, and at a later date the Albert Hall. It is notorious, however, that even such a one as an amateur of the moment who professes to his friends that he designed his own house is easily discovered by them on closer inspection to be a mere pretender; however bad the house may be, he has had the aid of somebody in making it no worse. Not only, therefore, ought critics of housebuilding to refuse *in limine* to believe in amateur influence, but they will find a much more wide and interesting field than they may expect in the study of the procession of professional intelligence by which, age after age, the improvement of domestic plan has been so signally accomplished. In all professions men run in packs; and it is a most remarkable instance of this that in each generation the whole building work of a locality is found to be so much alike in principle, no individuality, as a rule, clinging very much to the mode of the past, or forecasting otherwise than slightly that of the future.

The way in which a mere system of internal disposition carries with it its own peculiarities of structure and of artistic effect is a vital point in the true archæology of this question; and indeed this harmony of architectural style is a thing which in practice it is impossible to imitate fully. Houses of the present day which are designed in the style of Queen Anne even, when looked at in this light, are as gross shams as any, although the period imitated is one almost of yesterday. The admirers of this mode, if they would try the effect of an exact reproduction of a veritable example of the period, would soon find the true value of what they admire in the shape of an untenable property.

Designing a house in a bygone style, therefore, is in practice nothing more than dressing up a modern plan, modern construction, and modern notions of artistic effect, in a semblance of antique superficiality. The whole scheme of domestic building has developed itself up to the present moment in a certain inevitable course, and nothing can alter the facts of the condition thus arrived at, as the actual mode of the day. Whether it is advisable to imitate the antique at all in such circumstances is not the question we are considering, but the impossibility of carrying the imitation farther than a very thin skin is surely palpable. We may almost say it would require a whole company of artisans to arise from the grave to carry the effect into anything like authenticity.

At any rate, we may be allowed to doubt the expediency of tampering too much with the proper plan of our day in

endeavouring to please odd people by the introduction of fantastic features. Some otherwise good houses—and expensive houses—seem to be much too freely trifled with in this way. In another generation all the piquant tit-bits of plan and of design will have to be altered; and it may sometimes be fortunate if the alteration can be achieved without discredit to the memory of the playful architect.

### SUBJECTS FOR PICTORIAL DECORATION.

**I**N the present tendency towards a revival of the Renaissance style of architecture for large public buildings which admits, if it does not demand, pictorial decoration upon at least its interior walls, a few words may not be misplaced concerning the subjects adapted to such a purpose.

In spite of the artistic feeling now growing up amongst us, the better cultivation of which must henceforward form a component part of a liberal education, it must be confessed our surroundings are not of a character to favour their adoption in pictorial art of the heroic kind. In the first place, modern costume, even in the few cases where official vestments are retained, does not lend itself happily to pictorial treatment. Neither is it possible in this age of critical literalism—even to an insistence upon archæological exactitude in artistic representation—to adopt any other of a more suitable character. So that there are only open to us two alternatives: either to accept what we find, or altogether to abandon the real for an imaginary or more or less symbolical mode of treatment. Of course there are occasions when the former must be adopted or nothing at all. We can hardly imagine, for instance, a conclave of modern statesmen, say on the affairs in Egypt, arrayed in the sweeping folds and splendid personal adornments of the Middle Ages. Still, by keeping these two modes of treatment strictly separate, a judicious distribution perhaps need not jar on the artistic sense. Although such a course could not produce the unity and consistency of the finest periods of art in the past, it would be better to recognise it as a legitimately conditional one in a transitional period, as the present one with us must certainly be considered. We shall attempt to throw out suggestions from both points of view. But first of all it would be well to indicate the general qualities required for such decoration.

A subject adapted for pictorial decoration in a public building should have these characteristic qualifications. First, it should be weighty and important in itself, and admit of a corresponding largeness of artistic treatment; secondly, it should be general in its interest, and not aimed above the popular capacity of understanding.

The first range of subjects which strikes one is obviously the historic. Here, at least, is room for a vast selection of circumstances as well as costumes. Every shade of character may be given from the meanest to the highest; and even if the painter has to fix his models on known types, where they exist, yet he can put what expression into their faces he chooses. Even in this department he can play with his imagination almost as much as he wishes; as in the half mythical epochs of Arthurian legend and druidical ceremonial when an unformed society was making its struggles towards a more developed organisation. Or he can make selection of later periods of gorgeous pageant and high festival, with all the appointments of regal magnificence and splendour. Quieter episodes will meet him in monastery and convent and the tranquil pursuits of peaceful and learned men. In libraries and the abodes of learning it would be good to remind us of CHAUCER and his genial humanity, of SPENSER and the refinements of poetry, of SHAKESPEARE in his wide command of every human emotion and sentiment, of MILTON with his lofty eye fixed upon that liberty of thought and expression to which modern society owes so much. Other suitable subjects might be found in events or passages in the lives of those scholarlike men who have won for themselves a place in the temple of fame, whose voices are still heard, and who are still beloved by all thoughtful persons: the “judicious HOOKER,” with his modest mien and reflective bearing; good GEORGE HERBERT, the quaint singer of the heart’s best emotions; JEREMY TAYLOR, whose noble prose is too much forgotten in a busy generation—all these and many more in their lives, habits, and circumstances offer abundant material for every kind of illustration, and would form a wholesome stimulus to thought and reflection. It is true that historical representation

on a large scale and in its most stirring situations seems in a great measure out of date, but this, assuredly, is only because there has been little demand for it in the close domestic life of English homes, and the indifference with which large public works have been recently regarded.

Next to the historic may be mentioned the allegoric as another field suitable for pictorial decoration. In this department we should take the symbolic and personified representations of Trade, Commerce, War, Peace, Progress—the modern appliances for the transmission of thought, the forces of steam and electricity as applied to material uses, and so on. In the hands of a RUBENS these would certainly all have been capable of receiving a pictorial form without a loss of dignity or any descent into vulgarity, as is, indeed, exemplified in some of his works; and although many of these subjects have been treated over and over again, yet they would always take a new impress from a distinctively individual mind. At least, they would have the advantage of affording room for the display of drawing and colour, which, however misplaced in smaller work, making a more personal appeal, would be consistent and suitable enough in decoration.

From the allegoric we may naturally pass to the consideration of what is called the “Classic” order of subjects for decoration: that is, what relates to the State, history, and religious creeds of ancient Greece and Rome, which still retain a powerful significance for modern society. Of the fables of the ancient world which maintain the strongest hold upon the human mind, those of the gods and goddesses, in their origin, nature, adventures, and doings, their profound significance, and of the truth and beauty which they embody, it is not necessary here to speak at large. The emergence of VENUS from the sea-foam will always be to us a symbol of the purity and freshness from which true beauty must be born. HERCULES will stand to us a memento of the fight to be maintained against what is bad, low, and degrading. MINERVA will remain to us a monument of intelligence and intellectual power. The mingled forms of satyr, faun, and nymph will always speak to us as expressions of sentiment or emotion. We shall here find conceptions ready to hand of the highest types of the human form as the natural expression of the highest mental qualifications, as also the contrary. The religious and festival processions furnish us with material for the display of a hilarious abandonment to joy not possible to any occasion of our more subdued modern life; its adaptability to the frieze form rendering it still more valuable. Then, again, we have the wide field of ancient literature: the epic of heroes and heroic deeds sung by HOMER, the large tragedies of ÆSCHYLUS, SOPHOCLES, and EURIPIDES, with the monumental fables—if they may be called fables which contain so much essential truth—of PROMETHEUS, ŒDIPUS, and HERCULES. To these may be added the historical circumstances of two nations, many of them beacons for human government and action which cannot be forgotten whilst the race continues to exist.

Another department of our subject may be designated the literary. This would include the illustration of those large and important literary works which are familiar to all intelligent persons, which have indeed formed a part of universal education. Amongst these the dramatic scenes of SHAKESPEARE would first suggest themselves as offering typical subjects for the artist’s pencil. SPENSER would furnish us with episodes no less pictorial. Perhaps scenes from MILTON and DANTE would be generally too serious for ordinary decoration, but there would be places where these too might find a fitting position. Occasionally even less important works might be chosen for illustration, but, as a rule, it would be desirable to confine such works to the highest and best forms of literature.

After these there still remains to us the field of religion—a very wide one, both directly and indirectly. Though ecclesiasticism, at least in its pictorial display, must be considered to be losing its hold on the popular mind, that of religion must always maintain its ground. The varied scenes and incidents of the New Testament will never grow old or stale, however often treated, for their representation will always take the impress of the mind which strives to reproduce them, and will appear continually on new grounds of appeal. The parables of CHRIST, from their pictorial character, wide application, and their capacity of being universally understood, are very suitable for illustration. Without falling into conventional formalism—for this field has been widely worked in former days—much might be done, from a modern point of view, in bodying forth noble incidents in the lives of heroic and saintly persons, to

whom life was less dear than truth and loyalty to their principles, and which might be made fresh and interesting. Even the imaginative powers might fitly be called into play for the pictorial realisation of the ideal life which has been so touchingly and sweetly dwelt upon by some of the early Italian masters.

Passing from these, a number of miscellaneous subjects present themselves, as single figures of notable persons, others representing the practice of the useful arts, or symbolising the abstract professions, so many noble examples of which have survived from the Middle Ages. Musical and ceremonial processions of a semi-imaginative order may be mentioned; always remembering not to mix incongruous periods of time and inharmonious circumstances and events in the same apartment. The operations of agricultural and rustic pursuits always exercise a fascinating influence over the mind.

As regards the practicability of decoration on a large scale, a few words may be said. Although these decorations have been spoken of as painting, it is by no means necessary or desirable to limit them to that material. Some time ago an examination of the various methods available for artistic decoration was made in this journal.\* Other sound processes have since then been discovered or published, as that of A. KEIM in Germany.† Upon certain conditions of this decoration it is necessary to dwell very definitely; that whether the material selected be pigment, mosaic, sgraffito, inlay, or of any other kind, it must be broad and simple in design, as well as in workmanship. It may also be added that if colour is adopted, it should be used, generally speaking, rather in tints than in full-blown hues, and with a flat rather than a round treatment. For these conditions there are two reasons—one, that a pictorial mode of treatment, as distinguished from a decorative one, would be sure to injure and not to assist the architectural character and structural harmony of the building by a too particular and forcible appeal to the observation; and the other is, that extreme elaboration of treatment from a manipulative point of view would be prohibitive both as regards expense and the time required to complete the work. The designs should, therefore, be made in such a manner that they could be carried out by intelligent workmen under artistic supervision. Under no other circumstances will it ever be possible for us to form a school of decoration worthy of the name, or to have it executed on a large scale. The artist and the architect must work together, or at least not go counter to each other. The decoration must be a part of the building, and the building serve as a field and frame for the decoration. In this there is nothing extravagant or impracticable. By such a judicious system and distribution of work we may yet redeem the poverty-struck appearance of our walls, both internal and external, and leave something to future generations worthy of our own. But by no other means can this be accomplished. If artists are called upon completely to carry out their own designs, they must be limited, expensive, and long in growth. Executive skill, educated to narrower fields of manipulation, can only be wasted at a great disadvantage and its power lost.

There is no longer the excuse for the present apathy in regard to the pictorial decoration of architecture to say that permanent modes of painting even are not available. Recent inquiries and experiments may be said to have settled that question. And even if the work of the brush could not be left in its virgin condition, there are plenty of other methods and materials which are unimpeachable. So many experiments have been made—in the Westminster Palace, for example—which have not been satisfactory, that it would be a pity to let the matter drop, throwing away so much valuable experience. Let us strenuously recommend the agitation of the subject to those whom it may more nearly concern, and hope that in this respect England, which is doing so much for the fine arts in various directions, may establish a school of artistic workmanship purely its own, and one which may act as an incentive and beacon light to every other nation. The encouragement of such a state of things would certainly be a more worthy expenditure, both of taste and means, than the bestowal of fabulous sums for dubious articles of *virtu* which have perhaps nothing but their rarity—a circumstance upon which the world of art may sometimes be heartily congratulated—to recommend them.

## THE STATE AND ART.\*

THERE was an old Greek dance in which a torch was passed from hand to hand, and the action has been accepted as a type of the duty that lies on men to transmit the light of knowledge from one generation to another. "Every man," as HAMLET says, "has his own business and desire," but in addition to what he owes to himself as an individual, there are the obligations which arise in his relation as an unit in a great society, of which the duration is not to be measured by the brief term of a man's life. It was with a thought to the future that colleges and universities were founded, and the old trade guilds made it clear that even the humblest workers could almost instinctively rise above selfish interests. In England the universities cannot help diffusing the knowledge which is based on the scholastic "Arts," but it is otherwise in respect to the knowledge which is connected with what are called the fine arts. Elementary teaching is to be had in Government art schools, schools of music, and the like. But in all the higher branches of the arts the State does not provide teachers, and the artists decline to recognise any obligation to impart their knowledge. Having attained their skill with difficulty, they see no reason why they should make a more smooth way for their successors—it may not be plain to them why they should have successors. Hence we find a great artist like TURNER keeping his house fortified against the entrance of his brother painters, and a great actor like EDMUND KEAN swearing that he would sooner murder his son than teach him. REYNOLDS was eloquent in discoursing on everything but his own practice and experiments. If he wished to turn students away from portrait-painting, he could not adopt better tactics than the delivery of his annual addresses, in which the works held up for imitation are figure pieces, landscapes, and sculpture. Of late years there is a clearer recognition of social duties, one of the principal being the duty of teaching. But very few English painters have pupils, or are willing to speak of the methods they employ. Foreign artists visiting an English studio are often surprised at the habit of suspending work while they are present. Among architects pupilage is an institution, but it does not follow that it means a master's teaching. The law in the fine arts, according to English notions, seems to be every one for himself.

Much is to be said for and against the English practice. It fosters individuality, and its admirers can point to remarkable results. In every international exhibition the English paintings hold their own, yet the English school is little more than a century old, while some will say that it does not even exist. French critics are so deeply impressed by the sight that they are forced to prophecy a great future for English art. But the principle of "every man his own master" is not always an unmixed gain. "To be self-taught," says the greatest of living writers, "is a misfortune, except in the case of those extraordinary minds to whom the title of genius justly belongs; for in most cases to be self-taught is to be badly grounded, to be slovenly finished, and to be preposterously conceited." These words are perhaps more applicable to what is seen in an English art exhibition than to what is to be seen in English literature, for in the former there is a greater independence of that form of law which is known under the name of style.

Is it wise that the perpetuation of art should be left to individual efforts, or, in other words, to chance? The French do not think so. During two centuries, at least, and under very great varieties of governments, they have preserved a national art school, and while so many institutions have been overthrown, it has continued to flourish. The purpose of the pamphlet by Mr. W. H. WHITE is to describe how the French school was founded, how it is regulated, and what it has done. Mr. WHITE is nothing if not official, and it is natural that he should ascribe the foundation of the school to COLBERT, and assign him a position corresponding with that which so many people are agreed to give to the late PRINCE CONSORT in relation to the art of this country. We have not taken his view of the history of French art, and prefer to tell the history of the Academy in our own way.

We lately described the constitution of some of the guilds which existed in Rouen. One was formed of painters and sculptors, with St. LUKE for a patron saint. A similar guild

\* Vide Vol. xx., No. 517, November 23, 1878.

† For a particular description of this process, see *Journal of the Society of Arts*, No. 1630, February 15, 1884.

\* "Architecture and Public Buildings: their Relation to School, Academy, and State in Paris and London." By William H. White, Architect. P. S. King & Son.

existed in Paris, and was known as the Communauté de Saint-Luc. The members were known originally as *imagiers* or *imaginiers*, or, in other words, they considered their highest duty to be the making of images for churches. The trade rules corresponded with those in other guilds. It was necessary to serve an apprenticeship of five years and a companionship of four years before a man was eligible for election. There was a master with despotic powers over all the works of painters and sculptors. This arose from the connection of the guild with ecclesiasticism, and was of use in securing that pictures and images should be of an orthodox character. Nude figures were prohibited in churches, and by the rules of the guild it was penal for an artist to employ a model. It seems incredible, but art in France had to subsist amidst absurd regulations of that kind until the middle of the seventeenth century. In holes and corners, drunken shoemakers, and other needy folks who had scores at wineshops, were, however, induced to pose for the benefit of LE SUEUR, SEBASTIAN BOURDON, CHARLES LEBRUN, and others. If an artist were able to become one of the king's painters (and the number was probably not determined in order to give some freedom to art), he was supposed to be beyond the control of the guild. But in 1646 the works of two of the king's painters were confiscated by the master; and, what is no less remarkable, the court of the Châtelet (or city court) upheld the act, on the ground that the privilege was valid only when painters were at work on pictures or statues for the king. In consequence of the decision, many works were seized. One exception was made—namely, CHARLES LEBRUN; but he was too honourable to stand apart from the sufferers, and to his clear head, determination, and diplomatic skill the Academy owes its existence. The tyranny of the guild was felt by patrons as well as artists, and LEBRUN was able to prevail on M. DE CHARMOYS, who was a friend of old NICHOLAS POUSSIN, to lay the artists' case before ANNE OF AUSTRIA, the queen mother. Through her influence an order was made by the Council of State on January 20, 1648, by which the infant academy was recognised, and the members of the rival society were forbidden to interfere with it. But the recognition was not accompanied by any gift for the support of the new school, while, on the other hand, St. Luke was wealthy, and could give excellent suppers. The venerable SIMON VOUET was elected master of the guildsmen, and he conceded the liberty to employ a model. His name was a tower of strength, for the principal painters of the century had worked in his *atelier*. MIGNARD afterwards became head of the old society, and as there was little to be gained by adherence to the cause of reform, he was able to attract LEBRUN's friends. An amalgamation was projected, and it seemed quite possible for the latter to be left alone. LEBRUN was not without resources. In 1654 he placed his academy under MAZARIN's protection, but not a florin came from the treasury. On the cardinal's death LEBRUN invoked the aid of COLBERT, who was more liberal, and, in 1663, the academy was included among the institutions which were recipients of the king's bounty. Thus, after seventeen years of struggle, LEBRUN was successful.

It is recorded that the first duty of the academy was to introduce the living model and afterwards to form classes for anatomy, geometry, and perspective. Accommodation was found for meetings and exhibitions in the Palais Brion, Hôtel de Richelieu, and finally in the new Louvre. But the 2,000 livres allowed by the State were insufficient to meet the expenses, and in consequence it was sometimes found to be impossible to hold exhibitions. Poverty, however, did not teach toleration. The academy would allow the model to be posed in no *ateliers* but its own, and used force to attain that end. The Society of St. Luke was attacked with bitterness for many years, and when at length it succumbed, the Academy commemorated the event by having a medal struck, with the absurd inscription "*Libertas artibus restituta*." There is consequently a resemblance in the circumstances through which the Royal Academies in England and France originated. In both there was an artists' squabble, and the Incorporated Society in St. Martin's Lane corresponded with the Communauté de St.-Luc. Both claimed to be endowed by royal munificence. In England the grant was only 5,000*l.* from the privy purse; in France it was an annual sum of 2,000 livres. The French Academicians felt themselves bound to open the exhibitions to the public gratuitously. The English Academicians acknowledged a similar obligation, but said they were compelled to charge a fee at their first exhibition, in order

"to prevent the room from being filled with improper persons." The subterfuge may still be used. It has enabled the Academicians to secure an independence which would be impossible in France.

If the French Academicians formed a less wealthy corporation, they contrived to do more for art education than was attempted in England. Every member had to pose the model daily for a month at a time; he was bound to paint or model in the presence of the students, to discuss subjects with them, and answer their criticism on his own work; he had to take his turn in directing the schools; and, in addition, to subscribe towards the expenses to the best of his ability. There was plenty of despotism in the treatment of rivals; but at the Revolution, when inquisition was made into abuses, the Academy was spared. MIRABEAU defended it, and perhaps with more willingness through admiration of that same despotism.

A school of the Paris Academy was not so well furnished with models as an art school in a modern English town, and it is recorded that when a cast of an antique torso was broken in one of the numerous removals its loss was bewailed as if it were a treasure of great price. There was only one prize that was of importance, the famous Prix de Rome. How it originated is not clear. About 1624 CHARLES ERRARD, then a youth of eighteen, arrived in Rome for the study of ornament, or rather for the accumulation of patterns. He was not so much an artist as an organiser. In course of time he obtained several contracts in Paris, and among others the decoration of a house belonging to COLBERT's father-in-law. We can imagine that ERRARD explained to the minister the advantages of a residence in Rome for an artist, and that, in consequence, LOUIS XIV. resolved to support twelve artists, each for five years, in that city. ERRARD was appointed to make the arrangements, and on the 7th of March, 1666, he set out from Paris with the first batch of students. While he remained in Rome he sent to Paris casts from Trajan's Column and other works, which are still in the Ecole des Beaux-Arts. Nor was he neglectful of his own interests. It was in the school in the Palais Capronica that he had plans prepared for the Church of the Assumption in the Rue St.-Honoré—a domed building which is no longer used as a church. Although ERRARD was as ready to undertake architecture as any other kind of work (it deserves to be mentioned that he translated the four books of PALLADIO), he does not appear to have had among his subjects a student who was recognised as an architect. The record of the architects who won the Prix begins in 1720, and, unless we are mistaken, architects were not associated with the Academy until about that time. There was an architectural society which in one sense was an academy; but, as it did not obtain a charter until 1717, the members do not appear to have had any of the privileges belonging to LEBRUN's Academy.

When a studentship in Rome was founded there is nothing to show that more was intended than the establishment of an advanced school, for which Rome was supposed to be a more suitable position than Paris. But as the rewards in the Academy schools were insignificant the studentship was recognised as the one prize, and just as all roads are said to lead to Rome so the whole system of teaching is, and has been for many a year, arranged with a view to the attainment of the Prix de Rome. In many cases the victory has denoted genius as well as a peculiar mode of training, but in other cases it has been held to be evidence of no more than the training. From the Abbé DU BOS, in 1719, to VIOLETTÉ LE DUC, in 1864, there has been unceasing grumbling at the defects of the academic system. The alterations which have been made are evidence that it was not perfect. On another occasion we shall attempt to point out the shortcomings of the French school, which in this country is admired for merits it does not possess.

(To be continued.)

---

**Brighton.**—The large stone church in Queen's Square, Brighton, is, under the superintendence of and upon the plans and specifications prepared by Mr. Arthur Loader, architect, of Brighton, being carefully restored and recased with "Corsham Down" stone picked, supplied from Pictor & Co., Bath. Improved means of ventilation by "Boyle's" large up-suction ventilators, and additional air inlets have been adopted, the sanitary arrangements being also much improved. Mr. John T. Chappell, of 149 Lupus Street, London, is the contractor under a schedule.

## STUDIES OF LONDON CHURCHES.

[BY A CORRESPONDENT.]

(Continued from page 166.)

THE site of *St. Anthony*, Globe Road, Bethnal Green, is very like that of a church before commented on, Holy Trinity, Dalston Junction, and is designed by the same architect. It lies with its axis north and south, with streets at each end running transversely to it, so that scarcely any portion of the sides can be seen. As at Holy Trinity, there are no windows to the aisles. The walls internally are plastered, and the nave arcade is of stone. No tower exists, but there is a *flèche* over the division between nave and chancel. The latter is formed of two trusses about a foot apart, carrying the *flèche*. The nave roof is an open one, with substantial timbers. The chancel has a cradle wood ceiling neither stained, coloured, nor varnished, but with rather large circular medallions representing the emblems of the Twelve Apostles. Some of these emblems are not very pretty, especially when represented on a large scale, and their introduction at the present day is not to be recommended unless done very artistically. To have represented the Apostles bearing their characteristic emblems would have been more costly, but the writer cannot but think that anything short of this is undesirable. In like manner the emblems of the Crucifixion represented in a matter-of-fact way are no particular adornment to a church. How different is the effect when they are treated by the pencil of a true artist!

The interior of the famous church of *St. Mary-le-Bow*, Cheapside, was improved by Mr. Blomfield not long since without any destruction of the integral parts of Wren's building. It has been gilded and decorated in colour in a quiet subdued style with good effect. The pavements are laid with white, black, and grey unglazed tiles, only 3 inches square, colours which are in thorough keeping with the surroundings. Perhaps it may be hypercritical (and certainly Mediæval, and even earlier precedent, may be found), but do the three Greek crosses introduced in the pavement just to the west of the altar, only to be trodden upon, seem in the proper place? The ceiling or walls are surely better suited for such very sacred symbols of our faith. The vein marble step to the chancel arrangement harmonises well with the sober neutral shade of the paving. The choir seats are very happily designed, and quite in keeping with the style of the church. They are also without any admixture of Gothic feeling, an error that has been committed in several of the other City churches, when architects, whose practice has principally been in that style, have been allowed too much of their own way. The nave benches are of pitch pine, stained so as to harmonise with the dark old oak panelling. Though it is to be regretted that they were not of oak, the effect is good. The iron gaseliers, designed by the architect, are about the best in character which the writer knows. They are free from that too frequent firework-like and gimcrack ornamentation which is the delight of some metal-workers, especially Mediæval metal-workers, who "pile it on" exuberantly. The ornament in this case consists principally of honest twists and scrolls; the colouring is a kind of blue-black, sparingly gilded, without any other tints.

The church of *St. Paul's*, Knightsbridge, has not long since had a beautiful and effective decorative addition made to it. The blank, dreary surfaces under the galleries have been brightened up by glazed encaustic tile frames, flush with the surface of the wall, inserted under each window, with which they correspond in width. Each has a different subject representing some incident in the life of our Lord; and under each is an inscription stating to whom it is dedicated as an affectionate memorial. This is a good idea for the designers of new churches, who may arrange to leave blank recesses treated in some simple, effective way. The appearance would then be good, even if they are never filled up with subjects. The invention—or perhaps it may be better said the outcome of the invention—of hand-painted tiles seems likely to create almost a revolution in mural decoration. It has obvious advantages over mosaic, fresco, or tempera, though inferior, artistically speaking. But it would take too long and lead into too much discursiveness to enter into the respective merits of these different modes of decoration, while, moreover, the subject has been often ably treated of before by several writers. Let us pause for an instant, however, before losing sight of this tile decoration. In the present example the colours employed are neutral, and the treatment, as it ought to be, quite flat. Each panel has the same kind of architectural conventional canopy work, so that instead of being disconnected and an accidental appendage to the wall, such as could be taken off and hung up again, it has every appearance of forming an integral feature.

We witness at the church of *St. Luke's*, Kensal New Town, a vigorous attempt to grapple with the difficulties of a building for a congregation where every member of it can see the preacher and hear the sermon well, or to put it in another way, where every worshipper can witness the great sacrifice at the altar. For curiously enough, a church, the ground-plan of which is conven-

ently arranged for an Evangelical service (provided it has a fairly developed chancel), will often be equally suitable for a very High Church ritual. Whereas a church designed for a flock of "moderate" views does not please the "extreme ritualist," or the ardent Evangelical. The architect of *St. Luke's Church* (Mr. J. T. Lee), was a pupil of Mr. Blomfield, and the influence of the school of that master is evident. Economy has been a great object, and too much in fact, in the writer's humble opinion, has been sacrificed for it, the result being that the exterior even of the west front, which ought to be one of the most impressive parts, save the east end, lacks the dignity that a town church should have; a small parish church in a retired part of the country requires little stateliness. When the writer saw this church some time since, its east end faced open fields, but the enormous increase of building in the western suburbs of London has probably obliterated them. The north and south sides are little seen, there being no roads adjoining them; while at the west end the houses in the street come up close to the church. Considering the manner in which the architect was evidently tied down by the small funds at his disposal, it must be said that he has accomplished his task with much ingenuity and fertility of resource, even though one of the elements of effective architecture—*i.e.*, height—is wanting. If one wished to be hypercritical, it might be said that on strict Gothic principles Mr. Lee has transgressed in the west façade, cleverly as he has designed it. Feeling that if he exhibited the whole width of the nave and aisles (the former is some 35 feet in span) the building would look low and squat in its proportions, he has cut a square piece out of the south-west and north-west angles and carried the wall over by arches. This gives space for a little west window in this portion of wall, and internally has a very picturesque effect. The nave and aisle roofs are continuous, so that there are no ashlar-pieces to the former. This is a disadvantage not always to be avoided. The aisles are very narrow, without any seats, just sufficiently wide to serve as passages. Some may remark that it would be better to have a very wide aisle-less nave, and thus save the nave arcade and wall over it. But this would have reduced the apparent height of the building internally, have necessitated heavier timbers and construction to the roof, and have conducted to echoes, it being a well-known fact that churches with aisles and broken surfaces of wall are better, acoustically, than the parallelogram plan. Even as it is, the want of height previously alluded to has hampered the architect in the aisles, where, in order to get sufficient light, he has been obliged to make the windows too wide for good effect and the quarry glazing too large in scale. For the absence of a clerestory necessitates fuller admission of light through the outer walls. In order to economise, nearly all the edges of the brick angles are square and unchamfered, the material used being the ordinary grey stock, with a few bands of red brick. Following out the same object, the spire is of brick, banded with stone, and set on a tower of insufficient height. Instead of being terminated by a finial, weathercock, or cross, it has only a mere ball at the summit, which makes rather a poor finish. There are no tie-beams or tie-rods to the nave roof, but hammer-beams, supported on stone corbel-shafts, square in plan, which in turn rest on oversailing courses of brick. This square plan of shafts also appears in the arch opening out into the eastern apse, for there is no regular chancel arch. The face of the common rafters to the nave roof is boarded, and only the purlines are visible. There are tie-rods to the roof of the aisles, which must certainly stiffen and strengthen the construction, where the weight and thrust come. Turning to the nave benches, it will be observed that in the panelling of the backs the boards are fixed horizontally instead of vertically. This doubtless saves labour in cutting and fitting, but variety in the grain is lost. To conclude with the notice of this church, it is a good specimen of earnest striving in ecclesiastical architecture towards something characteristic of this century, something that may be worthy of the ritual of the Anglican Church. By a series of such efforts men may hope in time to arrive at the ideal now only dimly shadowed forth in their minds. The writer has, unprompted, endeavoured to picture the difficulties which pursue an architect with little money delivered to his trust, and may add that he has had but too frequent experience of such in his own practice.

*St. Jude*, Gray's Inn Road, has a good interior, with a well-proportioned clerestory, an open-timbered roof to the nave, and lean-to aisles. The east end of the chancel has a large rose window filled with painted glass, with a triplet window under. As respects artificial lighting, this is well managed by two rows of pendant lights instead of one central line of coronas, a mistake too frequently made. The west window is of unusual design, as its side lights are occupied by quatrefoils, continued round the tracery head. It is believed there is Mediæval precedent for such a treatment. But the idea is rather suggestive of the window having been found too small, and widened afterwards. In this case it was not so, as the window has not been altered since the church was built. In another case, however, at *St. Matthias*, Earl's Court, the chancel, owing to want of funds, was built of insufficient dimensions. When further means were in after years obtained and the chancel enlarged, this border system of tracery was adopted as a mode of still utilising the old east window. The

corbels at St. Jude's carrying the chancel arch have on the north side a carved mitred bishop's head, and on the south side our Saviour crowned with thorns.

Coming up High Street, Shadwell, which winds slightly, you will at one point see the great mass of *St. George's-in-the-East* looming in the distance with fine effect, enhanced the more by the poor insignificant houses around. You must, however, take care not to keep your glance too high in the air, as mundane matters have to be attended to. To speak plainly, you will meet many a seaman of every nationality as you traverse these eastern streets of London (how unlike the West End! one might really be hundreds of miles away from Regent Street), and an accidental collision with one of these worthies of the more fiery nations might possibly induce the use of the too ready knife! The tower of *St. George's* is square at the base, with an octagon at the upper stage, the angles of the latter being well buttressed. It is much of the same type as *St. Anne's*, Limehouse, with a flag-staff planted at the top. The latter is well seen from the river, and serves as a landmark to mariners. At each of the four angles of the church a cupola rises. Though not so striking in its outline as *St. Anne's*, the tower of *St. George's-in-the-East* has certainly a picturesque aspect. Till within the last few years modern architects have been too much wedded to the ideas of towers and spires, forgetting that there is a very beautiful and extensive borderland of design between them. Witness such examples in Mediæval architecture as at Boston (Lincolnshire), Sutton (Cambridgeshire), Lowick (Northamptonshire).

The church of *St. Mary*, Abchurch Lane, City, was not long since altered internally under the direction of Mr. E. B. P'Anson. Comparatively low open benches have been placed in the greater part of the body of the church. The old dark oak pews to the south of the nave on a raised platform still remain, and in these the school boys sit. There is a new chancel-seat arrangement for the surpliced choir of men and boys. The west gallery remains untouched. All the passages have been paved with mosaicically-arranged tiles, and there is a new altar-rail of oak, not quite in the style of Wren. In order to have something in harmony with the surroundings, a marble and stone pavement in squares, or a Roman mosaic pavement would have been more suitable. However, doubtless, as in many other cases, the extra cost would have been deterrent. Again, the backs of the new seats slope to such an extent that there is a risk of a dull sermon exercising its not unusual effect. Barring this and their light hue, the style of these modern seats seems quite in keeping with the rest of the building. To have slightly "sized" the oak would have darkened it a little, and made a less violent contrast with the old oak. The grand old reredos had not been touched when the writer saw it. No gilding or colouring in blue had been applied, as in the neighbouring church of *St. Clement's*, Eastcheap. As respects gilding, one may feel sure that Sir Christopher Wren would not have objected to its being added to his reredoses or other oak fittings, for it well suits the material and removes any appearance of heaviness and sombreness in large masses of unrelieved oak. The plan of a square, domed over, with the angles chamfered off under the cornice, is an effective treatment in a town church. From another standpoint it seems well adapted congregationally for a small church, enabling everyone to see and hear, but involves greater expense in the roofing than the more ordinary plan. For a good roof or ceiling, truth to tell, is difficult to design inexpensively. Why should not some of our rising Gothic architects (for Gothic architecture will be true to its history, and stand many a greater blow, as it has before stood, than evanescent whims of fashion) strike out a new line for themselves and adopt such a plan? There is many a lesson to be derived from these quiet old City churches, and the lessons must, alas! be taken soon, before these sacred structures reared by our pious forefathers are swept away by the modern Vandals.

*St. Augustine's*, Stepney, consecrated a few years since, is a parallelogram of considerable width; in plan consisting of nave, chancel, and aisles, the walls and roof running straight through without break from east to west. The notion of the architect has evidently been to adapt the basilican plan to the requirements of the Church of England, substituting, however, a square east end for an apse. Whatever advantages this form of plan may have, it certainly, in a church of no great length, like *St. Augustine's*, gives the impression of its being unfinished and wanting a chancel. To tell the truth, at the first blush this was the writer's own impression when entering the building, though there are three bays to the nave and one to the chancel. The shafts carrying the principals of the ceiling at the commencement of the chancel, instead of being corbelled out from the walls like the rest, are carried straight down to the floor. This, therefore, follows out the basilican idea, and a chancel arch is dispensed with. One of the disadvantages of this type of structure is that one sees it all at once, and misses that which is often so great a feature in a church—the chancel arch. The basilican plan seems more suitable for a very large church, and not for one of average dimensions. After

thus generalising, the design of *St. Augustine's* must be commented on. The west front is markedly plain, with a very small bell-turret. It has evidently been the intention to bestow little ornamentation externally, as scarcely any part of the building is visible from the surrounding streets, except the upper portion of the roof, which towers above the houses of the adjoining Commercial Road. The clerestory windows are, accordingly, perfectly plain, and with square-edged jambs, &c., in one order. The east gable terminates in a chimney instead of a cross. The latter can scarcely be seen except from the backs of the houses. Turning to the interior, the ceiling of the nave is of that trefoil form found in North Italy, there being a collar to the principal rafters where the two curves unite; the clerestory windows, cut up through the lower foil, thus giving somewhat the appearance of groining. This is pretty and effective, and out of the common, but at the same time a rather expensive treatment. Moreover, a building must be of good height for the roof cornice to be thus brought down so. The nave ceiling is coloured, that to the chancel being treated in a more ornamental manner, as is also the clerestory. The aisles are ceiled in the same manner, and have no windows. The clerestory windows are, as regards the interior arrangement, in couplets. Externally, they appear as separate windows with piers, not mullions, between them. Over each couplet is a circular moulded panel, filled in with marble in geometric forms. The chancel aisle arches on the north and south side are of stone, the nave arcade of brick. It should be added that the building is of bricks pointed internally above the nave arches, and plastered to the aisles. The early Christian plan of "ambones" is here faintly shadowed forth, the north "ambo" being higher than the south. The former has a plain canopy, a necessity in such a building when one considers the curved form of the ceiling and the absence of chancel arch, or anything to break the echo. The southern ambo is used instead of the ordinary lectern. The former is approached from the chancel level, raised two or three steps above it, and placed about west of the boys' seats and book-boards, rather concealing them, but at the same time standing out well from the nave arcade walls. To sum up the merits of this building, the interior is undoubtedly striking, and, as has been shown, possesses several original features.

The interior of *St. Jude's Church*, South Kensington, cannot help impressing the spectator on first entering it, owing to its look of length and general spaciousness. At the extreme east end one beholds a large six-light tracery window filled with good richly-toned painted glass. This gives much warmth of effect in a position where it is much needed. The writer remembers examining the church shortly after it was consecrated (in December 1870), before the glass was inserted, and has been struck by the subsequent improvement—the softer and more pleasing light. But it is much to be regretted that the windows in the quasi-transepts are not in character with the above. For some of those under the south gallery are of the Munich school, picture transparencies, ill according with the others. When will the responsible custodians of a church learn to be more firm in this most important matter of artistic consistency, and insist on all the windows, if not designed by one firm, being at any rate in harmony, and subject to a complete well-digested scheme? Then, when all have been happily finished, there will be a history in glass on the walls that can be read, instead of a series of subjects, which, however admirable in themselves, are disconnected. In the large circle in the tracery head of the east window of the chancel is a representation of our Saviour standing, implying His coming to judgment, instead of the more usual one of His sitting in majesty. The plan of the church is rather peculiar, as there are double quasi-transepts, for the nave arcade (carried on iron columns) continues unbroken from east to west instead of the more ordinary transept arrangement being adopted. No clerestory exists. There are aisles to the nave and galleries to the "transepts," the latter kept back so as to be within the line of the aisle walls. There is a plain brick arch at the entrance to the chancel, and another at the entrance to the sanctuary. The latter is somewhat narrower than the chancel. The writer is not aware of any Mediæval precedent for this treatment, nor does he perceive any meaning in throwing an arch in this position and emphasising the sanctuary in this manner. Possibly, however, this may be another way of arriving at what is seen in some old churches and in many modern ones, *i.e.* the roof or ceiling of the sanctuary more richly ornamented than the rest of the chancel ceiling. Some beautiful coloured decoration was effected to the chancel not long since. Over the key-board of the organ, and on the wall opposite it, are represented two angels with harps, turning towards each other, bearing the inscription, "Te Deum Laudamus." Panels containing various emblematic flowers, such as the lily, passion flower, &c., occupy the remainder of the side walls of the chancel. There is an elegant painted reredos, but owing to the sill of the east window being rather near the floor, it has been necessary to place the figure-subjects rather too low to be thoroughly effective. Over the altar is the *Agnus Dei*, enclosed in a circular panel with the Evangelistic emblems on either side. Flanking the altar are seated figures of apostles, pro-

phets, and elders. At the north and south sides of the sanctuary are, respectively, five panels containing figures of angels, some carrying harps and other musical instruments, some swinging censers. The lower panels are very near the floor, and contain alternating cherubim and seraphim, painted the conventional colours, and standing erect facing the spectator. All the other figures turn towards the Agnus Dei, the whole idea evidently being based on the Te Deum, and the worship of the Lamb as shadowed forth in the Revelation of St. John the Divine. It is to be regretted that the cherubim and seraphim were not placed higher up, as they suffer artistically through being, so to speak, looked down upon. Commenting on the exterior of the tower and spire of St. Jude's, the two-light bell-chamber windows should be observed, which have slate louvres of great projection. The latter are cut through by the central shaft and come out almost beyond the outer face of the wall. This treatment seems inferior to the deep oak louvre-boards, set back with the bottom edge flush with the outer line of the return of the window-jamb. If there is not depth enough at the back of the mullions or jambs, a frame can receive the backs of the louvres and secure them. It would have been better not to have terminated the gabled tops of the tower buttresses just below the parapet. If they had been carried up a little higher, the buttresses and pinnacles would have been better connected.

(To be continued.)

### THE SOCIAL SCIENCE CONGRESS.

THE Congress of the British Association for the Promotion of Social Science commenced at Birmingham on Wednesday under the presidency of the Right Hon. G. Shaw-Lefevre, M.P. In the course of his address the President said:—

It is twenty-seven years since this association held its first meeting in this great centre of industry, under the presidency of its illustrious founder, Lord Brougham, and once again only in the interval has it met here, in 1868, immediately after the passing of the Reform Act, which gave so great an impulse to social legislation. In his address on the first of those occasions, Lord Brougham stated the objects of the Society to be the scientific study of the laws which govern men's habits as members of a community, and of the principles of human nature upon which the structure of society and its movements depend. A science may be defined as the statement of the relation of phenomena to one another. No one, I think, can doubt that the phenomena of social life are dependent on one another, and stand in the relation of causes and effects, and that it would be possible for us, if endowed with infinite powers of research, to determine exactly their relations. It is, however, the most difficult of all sciences, for the phenomena are so numerous and complex, each of them producing an effect on most, if not all the others, that it is not possible by observation or induction to distinguish their exact relations. What we endeavour to do in social investigations is to separate certain classes of facts, which appear to have a close connection, from others more remote, and, explaining them by what we know of the principles of human nature, to determine approximately their connection as causes and effects. Among the methods at our disposal are comparisons of the conditions of people at different times and different places, and the deduction from their agreement, or difference, of the causes which account for them. Again, what experiment is to physical research an act of legislation is to social inquiry, for we are able to compare the state of things before and after the change; and we conclude that the difference is due to the legislation. The conclusion, however, is only justified to the extent that all other conditions remain the same. In physics, the experimenter is able in many cases to make certain that all the surrounding conditions are unaltered, and he is justified in concluding that the change he observes is due to the one disturbing cause which he has introduced. But in social experiments we cannot make certain that other conditions are the same; on the contrary, we know that they are constantly changing, and that other causes are at work which may have their share in producing the results we observe. Our conclusions, therefore, are approximate only, and must be subject to many reservations as to the effect of other concurring causes. Even, however, with this reservation, we have every reason to believe that we can, in many cases, connect causes with their effects, and determine the result of the experiments which we make in legislation. In this sense the science is as important, if not more so, than any other, for on its conclusions depend the welfare and happiness of vast numbers of people as affected by their laws and institutions.

It has been usual for your President to comment, in the spirit I have referred to, on the principal legislation of the past year in furtherance of those social objects which are the proper subject of the Society. In the present year a retrospect of the past session discovers nothing but a blank. Owing to circumstances I need not advert to, the progress of many most important measures was suddenly cut short, and Parliament was prorogued, to meet again

early in the autumn. In the absence, then, of any such topic, it may be well, especially here, in the birthplace of the association, if I ask you to look back at what has been achieved during its existence, and chiefly during the period of great activity since our last meeting here, and to endeavour to trace its general effect on the relations of the State to individuals, and on the functions of the Government.

In any such retrospect it will at once appear that there have been two very distinct impulses to legislation: the one in the direction of limiting the powers and duties of the Government, of freeing the action of individuals from the influence and control of the State, and of sweeping away what remains in our social system and laws of obsolete survivals of organisation formerly thought useful and necessary; the other in the opposite direction of increasing the intervention of the State in our social arrangements, of multiplying the functions of the Government and adding greatly to the number of cases where the law prescribes the conduct of individuals or restrains their actions.

I will endeavour briefly to classify, under the different methods of State intervention, the work which has been done by Parliament during the period I refer to. Under the first head we may group those cases where the State has undertaken, or has enabled local authorities on its behalf to undertake, some function, duty, or business, either to the exclusion of private agencies or in competition with them. First, and most important among these, is that relating to education. The establishment of elementary schools to make up for the great and growing deficiency of schools supported by voluntary contributions, and the compulsion on all parents to send their children to school within certain ages, is the most distinct advance that has been made in this direction. Few authorities, even of the strictest school of economists, have raised any objection in principle to it. I shall not waste your time in defending it. No greater educational effort has ever, within so short a period, been made by a State. No agencies which could contribute to the cause have been neglected. Local rates, local contributions, the fees of parents, State grants, have all been brought in aid of it, and as a result, in England and Wales only, over 16,000,000*l.* have been spent on new schools, accommodation has been found for 2½ millions of children in excess of what existed twelve years ago, and the school teachers have been increased from 12,000 to more than 37,000. It is absolutely certain that without State aid, and without the contributions from local rates, this could not have been achieved. No voluntary efforts could have made up the leeway, or have supplied the grave deficiency which existed.

Local authorities have felt the same impulse to undertake functions which were formerly left to private agencies. Many corporations now supply water and gas to their ratepayers, and make a considerable profit by it. It should be noticed that in these matters there can be no competition among private agencies; the public interest will not permit of several companies breaking up the streets in competition with one another. The alternative is for the local authority to give to some single agency in the district a concession, or a regulated monopoly, with a restricted dividend and maximum price. Under such concessions, experience shows that there is no great inducement to adopt improvements or to cheapen the price to the public, and that local authorities can do the work as well, and can secure to the ratepayers the profit of the supply.

Lastly, I might briefly refer to the increasing tendency of late years on the part of the State and of local authorities to regard the interest of the community in matters of art, and to provide for the recreation of the people. The great increase of our national collections; the loans of their surplus works to local authorities; the establishment by many municipalities of museums, art-galleries, and free libraries; the recognition that it is within the functions of such authorities to provide public parks and recreation-grounds; the movement of late years for the preservation of commons; the Act for the preservation of ancient monuments; the great interest in our public and municipal buildings, are all evidences of the increased regard for the public welfare in this respect. In some quarters these are all included in the condemnation of State action, and regarded as a tendency towards Socialism. It is only, however, by denying altogether the corporate existence of society, it seems to me, that such objections can be sustained.

I have now gone through the chief heads of the many cases of late years where the State has made its influence felt, or has intervened to regulate the conduct of individuals, or has added to its functions. With respect to many of them, I believe that the strictest economists of the older schools would have no doubt as to their expediency; others are to be justified either on their own merits and by their results, or on the same grounds as many other similar measures, in earlier times, which experience has approved. With respect to some few it may perhaps be doubted whether we have not endeavoured to enter too minutely into regulations, and have exceeded the limits of a wise interference of the State. It would not, however, be difficult, taking a broad view of the action of Parliament, to justify by results the general drift of its legislation. In this sense I might refer to the general evidences of improved condition of the masses of the population.

## NOTES AND COMMENTS.

THE Cathedral of St. Paul's is just now well worthy of a visit. Cartoons of the prophets JEREMIAH, EZEKIEL, and DANIEL have been placed in the pendentives under the Whispering Gallery as an experiment. If approved, they are to be executed in mosaic. The figures have been painted by Mr. R. TOWNROE from small sketches left by the late ALFRED STEVENS. Like all STEVENS'S work, they show original ability. It is almost always difficult to adapt figures to triangular spaces, and in one of the Paris churches the painter found himself so perplexed that he made the garments flow into spaces on altogether different planes from those containing the figures. Cartoons for two of the bays of the dome itself have been placed in their positions. If carried out in mosaic, the gold and colours in Mr. POYNTER'S design will blend well; but it will be almost impossible without the aid of a good glass to make out the subjects represented. There is a band of ornament underneath, in which grapes and vine-leaves are introduced effectively; but the stars and crosses which are introduced for variety are far too severe. They are only adapted for the plainest class of paving. What the subject of the companion cartoon may be is a mystery; at least it cannot be deciphered from below. The border is excessively clumsy and commonplace, and is without any suggestiveness. We hope that nothing will be done towards the carrying out of the cartoons until the public have had an opportunity to see the designs on a winter's day. The committee have in the collection boxes in the church a good test of what is thought of the designs. We doubt if either of the large cartoons will do much towards increasing the subscriptions.

THE question of ownership in drawings is often arising under new aspects. A correspondent informs us that he has lately prepared three sketches of three buildings, and he furnished with them estimates of the probable cost. The buildings were not erected. Fees were paid for the designs, but the sketches have been retained, and the holders decline to part with them. In such a case has the architect any remedy? The people who retain the drawings can hand them over to a builder, and they will be converted into working drawings by him without any apparent cost, and without any further payment to the architect. But we doubt if the architect has any redress. A judge would consider the designs as being like artists' sketches, and would say that unless there was an agreement that they were to be returned the purchaser could retain them. In the case of a painter a copyright might be claimed on the design, and it could not be produced in any other form, but the extent of an architect's copyright has not been fully determined. The Copyright Commissioners appear to have had doubts as to its existence.

THE Welsh National Eistedfod has met this year at Liverpool, and, as usual, something was done towards the encouragement of native art. Mr. J. MILO GRIFFITHS obtained a prize for a statuette group. Last year he obtained the gold medal and a first prize at the Cardiff meeting. Mr. THOMAS, of Carnarvon, was awarded the prize for the best design for a pair of semi-detached cottages for quarrymen, the cost of the two being about 300*l*. There was only one competitor for the prize offered for a mythological or historical group in sculpture, and as the model was below the special value the prize was withheld. The chairman, Major CORNWALLIS WEST, was of opinion that painting was neglected in Wales. The cause was said to be the difficulty of maintaining art schools. It was suggested that whenever young students having ability were discovered, means should be found to send them to Mr. HERKOMER'S school at Bushey, where several branches of art were taught. Mr. CORNWALLIS WEST believes that Welsh architecture is on a par with the painting, and he besought Welsh architects to forbear disfiguring the beautiful hills and valleys with any more structures like those which are now being erected. There is so much mutual admiration at the Eistedfods, it is a gain to have such frank criticism, and the Welsh artists will do well to ponder the remarks.

THE following are the special questions at the Social Science Congress, in Birmingham, which are to be discussed in the art department:—(1) "Ought elementary instruction in drawing to be made an essential part of the national education?"—Papers by Mr. JOHN P. SEDDON, F.R.I.B.A.; Mr.

CHARLES G. LELAND, and Mr. ROWLAND HAMILTON. (2) "What is the value to the ear, the mind, the health, and the disposition of the young, produced by class instruction in music?"—Papers by Lady MACFARREN and Mr. W. DE MANBY SERGISON, Organist and Director of the Choir of St. Peter's, Eaton Square. (3) "How can a love and appreciation of art be best developed among the masses of the people?"—Papers by Mr. WALTER BESANT and the Rev. W. TUCKWELL, M.A. Voluntary papers will be read on the following subjects:—"Art education in schools," by Miss S. SOPHIA BEALE; "The place of art in the future political economy of the nation," by Mr. P. H. RATHBONE; "Are local governing bodies justified in expending large sums of public money for the purpose of beautifying towns and of providing parks, playgrounds, and other facilities for public recreation; and, if so, what are the lines on which they can most advantageously work?" by Mr. T. C. HORSFALL; "A suggestion for the better preservation of open spaces," by Mr. ROBERT HUNTER; "A day of leisure, art's opportunity," by Mr. THOMAS E. POWELL, London Trades' Council Delegate, and secretary of the Bookbinders and Machine-Rulers' Consolidated Union (London Branch); and "The Drama," by Mrs. KENDAL.

THE chapel of Lincoln's Inn is far from being a good specimen of English Gothic, but the Chancery lawyers admire it, and have lately gone to expense to make it look like a new building. The Chancellor's Court was built up against the chapel, and therefore no more than a part of the south wall was visible. Workmen are now employed in removing the north end of the Court, and in a short time the chapel will be isolated. Whatever merit it may have can be studied on all sides. We understand that the fate of the Chancellor's Court has not been determined. There is a proposal to convert it into a reading-room for law students, which has met with many supporters.

COLLECTORS are acquainted with specimens of the Belleek pottery, which often resemble shells in colour, but are generally badly designed. According to a story told by a travelling correspondent of the *Times*, the origin of the pottery was due to accident. Mr. BLOOMFIELD, a landlord in the district, was struck with the extreme brilliancy of the whitewash on the cottages in the neighbourhood, and examined into the reason. The cause was discovered to be the presence of a certain clay which seemed specially adapted to the manufacture of porcelain. Assistance and capital were obtained from Mr. MCBIRNEY, of Dublin, who is described as a wealthy china-merchant, but who in reality was a partner in a "monster house" for the sale of drapery. If artistic skill had been employed the pottery might have been successful, but the peculiar colour was supposed to be a sufficient attraction. The remarkable thing is that Belleek was ill-adapted for the production of the pottery which bears its name. The clay was there, and it was all that could be desired for quality, but in such insignificant proportions that it did not repay extraction. The factory might have been more profitably established at any other spot in the island, nearer to the places whence it drew its materials. The clay came from Devon or Cornwall, the feldspar was fetched from Cornwall, the flints from Antrim, the fuel from the Clyde.

AN exhibition of metal-work and jewellery will be held in Nuremberg next year, which is likely to be attractive. The Bavarian Government will offer prizes to exhibitors in the shape of artistically-designed gold and silver medals, to be struck by the Royal Mint at Munich, and the town of Nuremberg will also present every exhibitor with a medal in commemoration of the exhibition. The guarantee fund already subscribed amounts to 5,000*l*., and the Bavarian Government has promised every possible facility for the forwarding of exhibits, and has granted immunity from duty to all objects, whether entering or leaving the country, which are intended for exhibition. There will be also an historical section, which will contain exhibits of metal-work, beginning from the earliest periods of its production, and descending in successive steps to the manufactures of the present day. So anxious are the promoters of the exhibition to obtain a good representative collection under this head from every country, that they have signified their readiness to defray all expenses of freight, &c., and to insure such objects against fire or other risk, besides taking every precaution for their safe keeping while at Nuremberg.

CONGREGATIONAL CHURCH, ACTON  
MESSRS SAVILLE & SON, ARCHITECTS.

DESIGN FOR ADMIRALTY & WAR OFFICES

PRINCIPAL STAIRCASE.

BY MESSRS ASTON WEBB & E. INGRESS REID

DESIGN FOR TOWN HOUSE

BY W. WALLIS BALDWIN.

## ILLUSTRATIONS.

DESIGN FOR PRINCIPAL STAIRCASE, ADMIRALTY AND WAR OFFICES.

A DRAWING of the grand hall and staircase was supplied by a few among the nine competitors. We publish this week one by Messrs. ASTON WEBB and E. INGRESS BELL.

DESIGN FOR MUNICIPAL BUILDINGS, NOTTINGHAM.

THE design by Mr. F. H. OLDHAM, F.R.I.B.A., of Manchester, which is published this week, was premiated in the late competition. The original drawing was exhibited in the Royal Academy this year.

CONGREGATIONAL CHURCH, ACTON.

UNTIL recently much inconvenience has been felt in this church on account of its imperfect acoustic qualities. Of the defects perceptible the most objectionable was a marked echo following the utterance of sounds. Remedial measures of various kinds had from time to time been adopted, but, probably owing to considerations of expense, had all been on too small a scale to promise much success. A short time ago, however, a special fund was raised, and a committee appointed to carry out a scheme of improvement of a more thorough character than had hitherto been attempted. Messrs. SAVILLE & SON were asked to examine the building and furnish suggestions for remedying the evil complained of. They found that the echo was chiefly attributable to the undue height of the nave, the form of the roof, and the large unbroken space in the body of the church, and recommended the introduction of a vaulted false ceiling below the existing roof, and of galleries in the aisles and across the west end. We are pleased to learn that the result is highly satisfactory both to the members of the congregation and to those engaged in the conduct of the services. Besides being acoustically advantageous, the new ceiling and galleries are admitted to be a distinct architectural improvement to the interior, and the galleries, moreover, provide 258 additional sittings.

The works have been executed, under the supervision of the architects, by Messrs. SPENCER & Co., of 77 Knightbridge Street, E.C., at a cost of about 1,200*l*.

Among this week's illustrations is a view of the interior as it now appears after the alterations.

DESIGN FOR A COUNTRY HOUSE.

THIS illustration is a reproduction of a water-colour, by Mr. WALLIS BALDWIN, which was exhibited this year at the Royal Academy.

## EVOLUTION IN ART.

A LECTURE was delivered on the 5th inst. by Mr. Frederic Harrison, in the course of which he asserted that Mr. Herbert Spencer was an unconscious imitator of Auguste Comte, the synthetic philosophy being only an attempt to play a new tune on Comte's instrument. Mr. Spencer in his reply referred to an essay he published in 1854 as containing the rudiments of his system, and in which there is nothing that is attributable to the French philosopher. The theory then set forth was that every active force produces more than one change or effect, the implication being that there is a continuous multiplication of effects of which increasing heterogeneity is the result. Some long letters from Mr. Spencer and Mr. Harrison have appeared in the *Times*, and the latter promises a thorough examination of the two systems. When Mr. Spencer says that he is not indebted in any way to Comte, his statement should be accepted without the least hesitation. The controversy has given fresh interest to the early thoughts of Mr. Spencer, and we accordingly give an extract from the essay of 1854, not only to exemplify the theory of the author respecting the evolutionary aspects of art, but also to give an opportunity to Comtists to discover anything in the same spirit in their philosopher's works. One of the shortcomings of the founder of Positivism was his coldness in regard to art:—

Written language is connate with painting and sculpture; and at first all three are appendages of architecture, and have a direct connection with the primary form of all government—the Theocratic. Merely noting by the way the fact that sundry wild races—as, for example, the Australians and the tribes of South Africa—are given to depicting personages and events upon the walls of caves, which are probably regarded as sacred places, let us pass to the case of the Egyptians.

Among them, as also among the Assyrians, we find mural

paintings used to decorate the temple of the god and the palace of the king (which were indeed originally identical), and as such they were governmental appliances in the same sense that state pageants and religious feasts were. Further, they were governmental appliances in virtue of representing the worship of the god, the triumphs of the god-king, the submission of his subjects, and the punishment of the rebellious. And yet again they were governmental as being the products of an art revered by the people as a sacred mystery.

From the habitual use of this pictorial representation there naturally grew up the but slightly modified practice of picture-writing—a practice which was found still extant among the Mexicans at the time they were discovered.

By a process of abbreviation analogous to that which has been abundantly exemplified in our own written and spoken language, the most familiar of the pictured figures were successively simplified; and ultimately there grew up a system of symbols, most of which had but a distant resemblance to the things for which they stood. The inference that the hieroglyphics of the Egyptians were thus evolved is confirmed by the fact that the picture-writing of the Mexicans was found to have given birth to a like family of ideographic forms; and among them, as among the Egyptians, these had been partially differentiated into the *kuriological* or imitative, and the *tropical* or symbolic, which were, however, used together in the same record. In Egypt written language underwent a further differentiation, whence resulted the *hieratic* and the *epistolographic* or *enchorial*, both of which can be clearly affiliated upon the original hieroglyphic. At the same time we find that for the expression of proper names, which could not be otherwise conveyed, phonetic symbols were employed, and, though it is alleged that the Egyptians never actually achieved complete alphabetic writing, yet it can scarcely be doubted that these phonetic symbols, occasionally used in aid of their ideographic ones, were the germs out of which alphabetic writing grew. Once having become separate from hieroglyphics alphabetic writing underwent numerous differentiations; multiplied alphabets were produced, between most of which, however, more or less connection can still be traced. And in each civilised nation there has now grown up for the representation of one set of sounds several sets of written signs used for distinct purposes. Finally, through a yet more important differentiation came printing, which, uniform in kind as it was at first, has since become multifarious.

While written language was passing through its earlier stages of development, the mural decoration, which formed its root, was being differentiated into painting and sculpture. The gods, kings, men, and animals represented, were originally marked by indented outlines, and coloured. In most cases these outlines were of such depth, and the object they circumscribed so far rounded and marked out in its leading parts, as to form a species of work intermediate between intaglio and bas-relief. In other cases we see an advance upon this. The raised spaces between the figures being chiselled off and the figures themselves appropriately tinted, a painted bas-relief was produced. The restored Assyrian architecture at Sydenham exhibits this style of art carried to greater perfection. The persons and things represented, though still barbarously coloured, are carried out with more truth and in greater detail; and in the winged lions and bulls used for the angles of gateways, we may see a considerable advance towards a completely sculptured figure, which, nevertheless, is still coloured and still forms part of a building. But while in Assyria the production of a statue proper seems to have been little if at all attempted, we may trace in Egyptian art the gradual separation of the sculptured figure from the wall. A walk through the collection in the British Museum will clearly show this, while it will at the same time afford an opportunity of observing the evident traces which the independent statues bear of their derivation from bas-relief; seeing that nearly all of them not only display that union of the limbs with the body which is the characteristic of bas-relief, but have the back of the statue united from head to foot with a block which stands in place of the original wall. Greece repeated the leading stages of this progress. As in Egypt and Assyria, these twin arts were at first united with each other and their parent, Architecture, and were the aids of Religion and Government. On the friezes of Greek temples we see coloured bas-reliefs representing sacrifices, battles, processions, games—all in some sort religious. On the pediments we see painted sculptures more or less united with the tympanum, and having for subjects the triumphs of gods and heroes. Even when we come to statues that are definitely separated from the buildings to which they pertain, we still find them coloured; and only in the later periods of Greek civilisation does the differentiation of sculpture from painting appear to have become complete.

In Christian art we may clearly trace a parallel re-genesis. All early paintings and sculpture throughout Europe were religious in subject, representing Christs, crucifixions, virgins, holy families, apostles, saints. They formed integral parts of church architecture, and were among the means of exciting worship, as in Roman Catholic countries they still are. Moreover, the early sculptures of Christ on the cross, of virgins, of saints, were coloured; and it needs but to call to mind the painted madonnas and crucifixes, still abundant in Continental churches and highways, to perceive the

significant fact that painting and sculpture continue in closest connection with each other where they continue in closest connection with their parent. Even when Christian sculpture was pretty clearly differentiated from painting, it was still religious and governmental in its subjects—was used for tombs in churches and statues of kings; while at the same time painting, where not purely ecclesiastical, was applied to the decoration of palaces, and, besides representing royal personages, occupied itself almost wholly with sacred legends. Only in quite recent times have painting and sculpture become entirely secular arts. Only within these few centuries has painting been divided into historical, landscape, marine, architectural, genre, animal, still life, &c., and sculpture grown heterogeneous in respect of the variety of real and ideal subjects with which it occupies itself.

Strange as it seems, then, we find it no less true that all forms of written language, of painting, and of sculpture have a common root in the politico-religious decorations of ancient temples and palaces. Little resemblance as they now have, the bust that stands on the console, the landscape that hangs against the wall, and the copy of the *Times* lying upon the table, are remotely akin not only in nature but by extraction. The brazen face of the knocker which the postman has just lifted is related not only to the woodcuts of the *Illustrated London News*, which he is delivering, but to the characters of the *billet-doux* which accompanies it. Between the painted window, the prayer-book on which the light falls, and the adjacent monument there is consanguinity. The effigies on our coins, the signs over shops, the figures that fill every ledger, the coat-of-arms outside the carriage panel, and the placards inside the omnibus, are in common with dolls, blue-books, paper-hangings, lineally descended from the rude sculpture-paintings in which the Egyptians represented the triumphs and worship of their god-kings. Perhaps no example can be given which more vividly illustrates the multiplicity and heterogeneity of the products that in course of time may arise by successive differentiations from a common stock.

Before passing to other classes of facts, it should be observed that the evolution of the homogeneous into the heterogeneous is displayed not only in the differentiation of painting and sculpture from architecture and from each other, and in the increased variety and speciality of the subjects they embody, but it is further shown in the structure of each separate work. A modern picture or statue is far more heterogeneous in its constitution than an ancient one. An Egyptian sculpture fresco represents all its figures as on one plane—that is, at the same distance from the eye—and so is less heterogeneous than a painting that represents them as at various distances from the eye. It exhibits all objects as exposed to the same degree of light, and so is less heterogeneous than a painting which exhibits its different objects and different parts of each object as in different degrees of light. It uses scarcely any but the primary colours, and these in their full intensity; and so is less heterogeneous than a painting which, introducing the primary colours but sparingly, employs an endless variety of intermediate tints, each of heterogeneous composition, and differing from the others not only in quality but in intensity. Moreover, we see in these aboriginal works a great uniformity of conception. The same arrangement of figures is continually represented—the same actions, attitudes, faces, dresses. In Egypt the modes of representation were so fixed that it was sacrilege to introduce a novelty; and indeed it could only have been in virtue of a fixed mode of representation that a system of hieroglyphics became possible. The Assyrian bas-reliefs display parallel characters. Deities, kings, attendants, winged figures and animals are severally depicted in like positions, holding like implements, doing like things, and with like expression or non-expression of face. If a palm grove is introduced, all the trees are of the same height, have the same number of leaves, and are equidistant. When water is represented, each wave is a counterpart of the rest; and the fish, almost always of one kind, are evenly distributed over the surface. The beards of the kings, the gods, and the winged figures are everywhere similar, as are the manes of the lions, and equally so those of the horses. Hair is represented throughout by one form of curl. The king's beard is quite architecturally built up of compound tiers of uniform curls, alternating with twisted tiers placed in a transverse direction, and arranged with perfect regularity; and the terminal tufts of the bulls' tails are represented in exactly the same manner. Without tracing out the like traits in early Christian art, in which, though less striking, they are still visible, the advance in heterogeneity will be sufficiently manifest on remembering that in the pictures of our own day the composition is endlessly varied: the attitudes, faces, expressions, unlike the subordinate objects, different in size, form, position, texture, and more or less of contrast even in the smallest details. Or if we compare an Egyptian statue seated bolt upright on a block, with hands on knees, fingers outspread, and parallel eyes looking straightforward, and the two sides perfectly symmetrical in every particular, with a statue of the advanced Greek or the modern school, which is symmetrical in respect of the position of the head, the body, the limbs, the arrangement of the hair, dress, appendages, and in its relations to neighbouring objects, we shall see the change from the homogeneous to the heterogeneous clearly manifested.

## LICHFIELD CATHEDRAL.

THE restoration of the noble west front of this cathedral is fast progressing, and several of the still vacant niches will shortly be filled with the statues intended to replace the old series. The arcade of kings, which forms such a striking feature in the front, will be soon completed, those of Penda, Wulfere, Ethelred, Offa, Egbert, Ethelwolf, Alfred the Great, Edgar, Canute, Edward the Confessor, Richard II., &c., being *in situ*, while those of King David, William I. and II., Henry I., II., and III., and Edward I. will shortly leave the studio of Mr. Bridgman, in Lichfield. A brief *resumé* of the other great groups of the west front will not be uninteresting. In the upper stage of the south-west tower are Methuselah, Noah, Shem, Daniel, and Job, with a small figure of St. Anthony over the belfry window on the south side. On the west front of this tower are Isaiah, Zephaniah, Jonah, Hosea, Ezekiel, Haggai, Micah, and Joel. The upper stage of the north-west tower is devoted to scriptural women—viz., Eve, Sarah, Rebecca, Rachel, Deborah, and Hannah; the first stage of the west front to St. Clement and St. Werburgh; and the central gate to the archangels Michael, Raphael, Gabriel, and Uriel. The figures on the moulding of the central doorway are Joseph, Judah, Shem, Noah, Enoch, Seth, and Adam on one side, the Virgin and Child, David, Jesse, Jacob, Isaac, and Abraham on the other. Occupying a similar position in the doorway of the south-west tower are Wilfred, Cuthbert, St. Augustine, Gregory, Paulinus, Theodosius, Aidan, &c. The figures of the bishops of the diocese include those of Bishops Hacket, Clinton, Lonsdale, Patteshull, Langton, and Selwyn. St. Chadd, the patron saint, occupies his old place in the centre of the whole.

## ART TEACHING IN BIRMINGHAM.

THE session of the Birmingham School of Art was opened on the 15th inst., when the headmaster, Mr. E. R. Taylor, delivered an address. He referred to the success of the students. In the last national competition they gained 43 medals and prizes—more than one-tenth of the whole awarded to the 201 schools of the United Kingdom. South Kensington had 21 awards, or less than half the number of Birmingham. Although they had not obtained a gold medal, they were the highest in silver and bronze medals and in prizes. Theirs was as large a school as South Kensington; but it should be stated that at South Kensington the students were mostly advanced and studying all day long, while about three-fourths of the Birmingham students were elementary, and studied only in the evening after a hard day's work. In the preliminary examinations of this national competition they had 143 prizes. The returns of this competition were not issued, so that they could not compare their success with that of other schools; but, so far as he could ascertain from the Blue Books, nothing approaching this number had ever been gained by one school. All their modelling students except one had passed the Government examination. They had a total this year of 239 medals and prizes and 384 certificates. Analysing the 143 prizes first obtained on the work of the sections sent up to South Kensington, he found that they showed the wide scope of the school, as an educational institution, as a school of advanced art, and as a school of industrial art. Thirty-nine of the awards were for design, and its collateral studies, not including modelled designs; 12 were for modelling (a great success for so small a class); 38 for painting; 18 for life; 27 for antique; 10 for more elementary studies. They had some good seed for the gold medals next year, but they would have fearful hard work to maintain the total of awards obtained this year.

Passing on to the principles and methods which should be followed in an art school, Mr. Taylor said that art had had many definitions. It might be compared to the chemical combination of two substances, by which a new substance was formed. It was the beauty in nature and the humanity of man combined. Man must be receptive, or, speaking chemically, have an affinity, and at the same time be an active influence on the result, though this was best where he was so unconsciously. Raphael never produced a Madonna so fine as his model; Turner never painted a landscape more glorious than his eyes saw; not a designer invented lines or combinations of colour equal to what he had seen in nature. One man, however, would degrade everything he touched, whether a lovely face, a landscape, a chalice rich with jewels, or a simple cup and saucer; while another would elevate and refine them, and both do it unconsciously. All art bore this stamp of humanity, and it was this expression of various minds and souls in form and colour which constituted the art of which they spoke. They had, therefore, a difficult task not only to see and to do, but what to see and what to do. By placing before them natural forms which were beautiful, and those beautiful creations of past ages which had been spared to them; by the discipline of the schoolroom; by seeking for their own self-culture, not only from books, but in a constant effort to develop in their lives whatever there was in them of grace and purity; and by noting for them what was graceful and pure in their work or their model, their art teachers might be able

to do something to counteract those sordid surroundings which were the legacy of the first half of this century, and to revive that silver thread which brightened the lives of Englishmen from the ninth to the sixteenth century, and though dimmed, continued even later, but which the narrowness and misdirected zeal of our immediate forefathers destroyed.

Art culture and traditions, while dead in England, survived on the Continent, though in debased forms; but in spite of this disadvantage the present English revival was such as already to awaken the admiration and jealousy of our neighbours. They had a great respect for our system and its results. The tide was already turned, and instead of everything artistic being imported from France and Italy, our art work and art workers were now sought for in those countries. This was the result of flooding art knowledge and power among all classes—the consumers as well as the producers. Where we were still lacking as compared with our neighbours was in the desultory and optional teaching of drawing in our elementary and public schools. Drawing must begin in the infant schools if art was to be part of our national life, or the education of our children be at all perfected. Its elements were easier to teach than reading or writing, and the time was not far off when every English boy or girl would be able to draw and model better than he could read or write. Mr. Taylor then described in detail the course of teaching now adopted in the Birmingham School of Art, pointing out the use of its various departments, and making various suggestions of general application by which many difficulties might be overcome, and serious errors avoided. The new school of art buildings would, he pointed out, enable many things to be better done than at present, and if only our artisans and others would continue to profit by the educational advantages now so amply provided in the town, the time would soon come when Birmingham would rise still higher in her artistic productions, both industrial and fine art; but his hope over and above this was that they might live to see the time when beauty and its humanising influence might be felt in every home in Birmingham. That they might have part in realising that let them take with them the three words—conscientious, workmanlike, graceful.

### CHURCH RESTORATION.

THE Secretary of the Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels, has written the following remarks on the position of the Society with regard to church restoration:—

I am afraid it must be admitted that in the early days of the Society the money was not spent as it would be now. But I do not think the Society was to blame. It was in advance of the age. Its object was to provide additional church accommodation, and it was its misfortune, not its fault, if ecclesiastical architectural taste was at such a low level that many and many magnificent and interesting architectural features could be ruthlessly swept away to make room for the erection of a huge painted deal gallery; or a very beautiful though small parish church could be destroyed to be supplanted by a church of the "Gothic sort" with cast-iron thirteenth century pillars coloured white.

*Mais nous avons changé tout cela.* At the present time, and for some years past, no grant is made unless the plans are first passed by a committee of twelve of the leading men in the profession, including such well-known names as Christian, Pearson, and Bodley. The misfortune is that such a very large number of the plans submitted are below mediocrity. And what is the cause of this? It very frequently happens that a local committee is formed to "restore" the parish church. Possibly a leading member of this committee has a friend in the profession; or there is a local architect, accustomed to building rows of houses, with an occasional assembly-room, and the job is given to him, in order, it is thought, to encourage local talent, or to save expense.

Now, I do not hesitate to say that there is no branch of architecture that requires more careful study and education than that of church restoration. In order that the work may be properly carried out a man must be a lover of antiquity, a painstaking archæologist, a student of history, and, not least, a thorough churchman.

In ninety-nine cases out of a hundred it is impossible to restore a church to what it was originally, because in all probability the church contains work of one kind or another of many different periods, each of historical interest; and, in any case, guess work must be the guide to a very great degree.

It seems to be a fault not uncommon with many church restorers to try and spend as much money as possible, so as to get the church to look neat and trim, and to make believe that it has just come from the hands of the original designer. But is it not the truest and in every way the wisest plan to do as little as possible? Of course there are some things necessary. No one would advocate the retention of Georgian galleries and high pews with all the paraphernalia of carpets, arm-chairs, scrapers, and locks; and the actual repairs caused by past neglect and the decay of time must be attended to; but I would ask, is not very much done that is needless and wasteful, to say nothing of bad taste, in

scraping all the signs of age from old stones, doing away with slab pavement to lay down vulgar encaustic tiles, removing the plastering off walls so as to point the rubble, and even in certain cases the brushing off of the much-abused whitewash? I am sure that many thousands of pounds are often uselessly spent, not in church ornament—by all means let those who will devote their means lavishly to the adornment of God's house—but in the reckless destruction of all records of the past, whether eighteenth century or thirteenth century. Our committee of architects, who give their services gratuitously, aim at guiding, so far as they can, all church reparation in a truly conservative spirit, but they cannot make good plans out of bad ones.

### ROYAL ALBERT EDWARD INFIRMARY, WIGAN.

IT will be remembered that a new infirmary was erected in this town about ten years ago, and opened by H.R.H. the Prince of Wales, who paid a visit at the same time, accompanied by the Princess, to Lord Crawford at Haigh Hall, near the entrance-lodge of which the infirmary was erected. This building provided accommodation for about 100 beds, and the success of the undertaking has been very complete and satisfactory to those who supported and inaugurated it. So much is this the case that it has been found necessary to enlarge it, and a detached wing is now in course of erection containing accommodation for twelve special wards for severe cases, children's wards, and a separate nurses' home of twelve rooms, with the necessary kitchens, lavatories, bath-rooms, &c. These will be connected to the main block by a glazed corridor, which it is proposed to make into a winter garden and exercising place for the convalescent patients. Mr. Thomas Worthington, of Manchester, was the architect of the original building, and Messrs. Worthington & Elgood are now carrying out the additions in a similar manner. Mr. J. Preston, of Wigan, is the builder employed, whose contract for the portion of the works already decided upon amounts to about 3,600*l.*, exclusive of the internal fittings and other work.

### QUEEN MARY'S HOUSE, JEDBURGH.

THE house known as Queen Mary's House, Jedburgh, is now tenantless, after being occupied for centuries. This has been brought about by the late tenant, Mr. A. C. Mounsey, rector of the grammar school, removing to the new schoolhouse at the Friary, while no other seems to covet the historical old mansion as a residence. When or by whom the house was built is not known. Some have held that it was one of the six bastel-houses alluded to by the Earl of Surrey in his account of the storming of Jedburgh in 1523. In the records of the Privy Council it is called "the house of the Lord Compositor;" but in 1566 it would seem to have been in the possession of the Kerrs, as among other payments made by the unfortunate queen at that time was one of forty pounds to Lady Fernherst for the use of the house during her abode in Jedburgh. It appears also to have belonged at one time to the Wigmores, from a carved stone in the front wall, over an arched doorway now built up. On this stone is a shield having on the dexter side the arms of Wigmore of that ilk, with the motto—"Avis la fin;" and on the sinister side, those of Scott of Thirlston, Buccleuch or Howpalsley, not Harden, with the motto—"Solum deo confido." In the end of the last century the property belonged to Provost Dr. Lindsay, whose daughter was the "Sweet Isabella Lindsay" of Burns. It is now owned by Colonel Armstrong, St. Petersburg. The house, which is three storeys in height, and thatched, with corbie steps at the gable-heads, is composed of a principal building in front, with a square tower at the back, resembling a border peel of the smaller type. The lower storey is all arched with stone, as is also the upper storey of the tower. A broad stone stair leads to the second floor, while leading to the third is a narrow spiral one, also of stone. When Queen Mary came to Jedburgh in October 1566, attended by her Ministers of State, her law officers, and many of her nobles, to hold an assize, she took up her abode in this house, and on her returning from a visit to Bothwell at Hermitage Castle, at the close of the assize, she was attacked by a fever which almost terminated fatally. The room in which she lay during this serious illness is, according to tradition, a small apartment in the back part of the house; but Miss Strickland, in her work on "The Queens of Scotland," says, in regard to this point, that "the spacious suite of apartments on the opposite side of the staircase, one of which still bears the name of the guard-room, is more likely to have been occupied by royalty as ante-room, privy chamber, and bedroom." There is still shown to visitors a piece of tapestry hangings, representing the meeting of Jacob and Esau, said to have been wrought by Queen Mary's maids during the royal visit. The late Dr. Robert Chambers, while referring to this house in his "Pictures of Scotland," says:—"With its screen of dull trees in front, the house has a somewhat lugubrious appearance, as if conscious of connection with the most melancholy tale that ever occupied the page of history."

## ST. MARK'S, VENICE.

THE following account of a recent incident in the opposition to the restoration of St. Mark's, Venice, is given by Mr. Wallis, the honorary secretary, St. Mark's Restoration Committee:—

The destruction of the tessellated pavement of the basilica having been successfully resisted, thanks, in a great measure, to the earnest protest of the late Mr. Street, the restoring authorities lately determined to take the inside marble panelling in hand. It will be remembered that it possessed qualities of tone and colour that time alone can impart. These it was proposed to remove and to restore the decorative panelling to its pristine condition, to use the language of the restorers. As soon as it was known that the workmen had commenced operations an alarm was raised in the Venice papers. The Venetian artists at once organised an opposition. They protested as a body, with the result that the projected flaying has been abandoned. Their action was entirely spontaneous, and without the interference of this committee.

Besides announcing a fact of good augury for the future, permit me to point out that it affords a justification for the creation of the committee in the first instance. Its object necessarily interfering with the rapacity of some Venetian architects, naturally entailed the opposition, not only of these, but of others who profited by the works. A cry of foreign interference, by whom fomented it is unnecessary to inquire, was raised in certain journals. This, however, when it was seen how many distinguished Italians joined the committee, soon subsided. As the first protest against the desecration of St. Mark's came from an Englishman, so, doubtless, the committee owes its origin to English action. When Mr. Ruskin first raised his voice against the restoration of the building of which he has written such a splendid record, he stood alone. His words, however, soon found an echo in the Peninsula. So, when at an especially critical period, when it was seen that the west front of the Basilica was in danger, our habit of association having naturally suggested the formation of a committee, the movement very soon received the cordial assent of those Italian students of art and history who were alive to the value of their public monuments. Now, at least at Venice, they have shown that on an emergency they can act with promptness and decision.

It will be regrettable if the present awakening to the disastrous effect of restoration in England dies out without any practical result. Without organisation the most spirited denunciation of malpractices is of little avail. Where one man is bent on working out his fad, and another puts money in his pocket by helping him to do so, the indignant protests of individuals are powerless, the interested parties being perfectly well aware they have only quietly to bide their time. They bow before the storm as it passes, and placidly finish the business at their leisure when the wrath of their opponents has evaporated.

The Society for the Protection of Ancient Buildings is doing good work, but which could be materially helped by local action. If organisations were formed in every country showing the townsfolk and villagers what of the legacy of their ancestors there is still left that is precious and beautiful, it can scarcely be doubted but local patriotism will act as efficiently here as it has recently done in Venice.

## GLASGOW ARCHÆOLOGICAL SOCIETY.

IT has been the almost invariable custom of this society ever since its institution to devote a day annually to visiting and carefully examining some ancient edifice or other object of antiquarian interest within easy reach of Glasgow. In this way there have been visited within the last ten years of the society's history Linlithgow Palace and Church, Castle Campbell, the castles of Tantallon, Dirleton, Caerlauerock, Doune, Rothsay, and Murthly, Crossraguel Abbey, the cathedrals of Dunkeld and Dunblane, Dunfermline Abbey and Palace, the Roman camp at Ardoch, and the eastern portion of the Wall of Antoninus. The excursion this year took place on the 9th inst., the day's programme including the castles of Borthwick and Crichton, in the neighbourhood of Dalkeith. A careful inspection of Borthwick Castle was made, in course of which Mr. Dalrymple Duncan read a paper descriptive of its history. Borthwick Castle is the largest specimen in Scotland of the Border keep, or square tower, and is also notable for the fact that, although at the period of its erection the owners of similar structures were in general grouping new masses of building round the original edifice, the object of its founder appears to have been to secure all the space and accommodation of these clusters of buildings within the four walls of his simple square block. So large is the fortress that it has been often mistaken at a distance for a Norman keep, of which it is well known there is no specimen north of the Tweed. Its dimensions are as follows:—74 feet by 69 feet outside the walls, the latter being 14 feet thick near the bottom. The battlements are 90 feet high, and the roof is 110 feet. The great hall is 51 feet long and 24 feet wide. On the motion of Mr. Murdoch, a hearty vote of thanks was awarded to Mr. Dalrymple Duncan for his paper. The members present also unanimously expressed their indebtedness to Mr. Honeyman for his explanations of the architectural characteristics of the castle.

A short visit was paid to the parish church of Borthwick, of which, however, only the south transept is old. Here the attention of the members was mainly directed to the fine recumbent statues of the first Lord Borthwick and his lady. In consequence of the time which had been necessarily devoted to the castle and church of Borthwick, and that Crichton Castle was ascertained to be farther from Dalkeith than had been anticipated, the visit to the latter very interesting edifice had to be deferred. The party therefore drove direct to Dalkeith, and on reaching Edinburgh dined together in the Windsor Hotel—Mr. Honeyman in the chair.

## AN AUSTRALIAN COUNCIL CHAMBER.

THE Sydney authorities are making efforts to secure the completion of the new town hall during the centennial year of colonial settlement—1888. That portion of the building which is situated in the very heart of Sydney, although formerly it was portion of the suburbs, has been finished, and presents an imposing appearance. The council chamber, which was recently used for the first time, is 42 feet long by 30 feet wide, and its height is 27 feet, and it is provided with a gallery 30 feet by 12 feet, which is intended for such of the public as desire to watch the progress of aldermanic business. The chamber is furnished with a canopied mayoral throne, also rows of portly chairs for the aldermen, and behind the latter are cushioned benches upon elevated platforms. The chairs are adjacent to a large table, near to which are tables for the town clerk and representatives of the press. All of the furniture is of rich design, and cedar wood is used in its construction. The walls are cemented and enriched by coupled columns, with entablatures and cornices. The floor consists of oak parqueterie with a fancy border, and heavy curtains are to be suspended in front of the doors to protect the inmates from draughts. The grand staircase leading to the chamber is a handsome structure. The steps are of slate, the strings of white Sicilian marble, the newels of rouge royal marble from Belgium, and the balustrade is of wrought-iron artistically designed, with cedar handrails. The town hall, in which public meetings and other gatherings are to be held, will be one of the largest in the world, and the interior will compete with any edifice of a similar character in the United Kingdom.

## CHURCH BUILDING IN IRELAND.

A NEW church was consecrated in the diocese of Dublin on the 11th inst., for the parish of Kildrough (Albridge). It occupies the site of a conventicle kind of structure erected about seventy years ago, which had four square walls, a flat plastered ceiling, galleries on three sides, and parlour high-backed pews, eight of which were provided with private fireplaces. The new church, the end walls of which stand on the old foundations, consists of a nave, 60 feet by 25 feet; a north aisle 15 feet wide, and a north-west chapel, built to contain a large organ; a chancel, 29 feet by 21 feet, with vestry, furnace rooms, porches, &c. An old tower has been left standing, and has been remodelled. The whole building has been carried out in consistent Early Decorated detail, the architect being Mr. Thomas Drew, R.H.A., diocesan architect for Down, &c. The special gifts to the church have been elaborate, and all designed by the architect. They consist of a font in marble stone and alabaster, a pulpit in stone and marble of elaborate design, credence table, carved by Messrs. Sharpe & Emory, of Dublin; a fine organ, recently built by Messrs. Foster & Andrews, of Hull, at a cost of 800*l*.; brass altar rails, by Messrs. Brown & Downing, of Birmingham; carved oaken desks, by Whippel & Co., of Exeter; brasses by Lavers, Barraud & Westlake, of London; heating by Bacon & Co.; bells rehung by Taylor & Co., of Loughborough; oak altar by Hems, of Exeter; encaustic tiling by Craven, Dunnill & Co. Red Whitehaven stone has been used for the cut stone of the exterior, and Bath stone for the interior. The general contractor for the works has been Mr. Samuel Bolton, of Dublin, and the cost about 3,000*l*.

Church building, improvements, and restorations of the buildings of the Disestablished Church of Ireland progress actively in spite of the present depression of property among the landowners, and the extinction of the great fund which was annually available for church building under the former Ecclesiastical Commissioners. This new church is within a mile or two of a costly Romanesque church in the adjoining parish of Clare, erected from voluntary contributions, and consecrated within the last twelve months. It is remarked that since the cessation of grants from the public fund, amounting to 50,000*l*. or 60,000*l*. per annum, which the Established Church in Ireland had to draw on previous to 1870, and since church building has become a matter of voluntary effort, the characteristics of the architecture and richness and costliness of the churches built have been vastly improved, and the poverty-stricken style of building encouraged and promoted by the old Ecclesiastical Board, under a vicious system of providing the maximum number of "sittings" at the minimum cost per head, is

a thing of the past. There prevailed throughout Ireland twenty years ago a monotonously bad and objectionable type of church architecture, affected by the then Established Church—a type which, in the difficulty of relegating to any style in particular, used to be known as the “neat and appropriate.” The Disestablished Church community may be congratulated on better quality of architecture if less in quantity is produced per annum, and on putting their hands in their pockets to pay for it with a liberality and spirit which was unknown in the state-aided days.

### THE SAXON TOWER AT EARL'S BARTON.

A MEETING of the committee for the restoration of Earl's Barton Church was held lately, when the following report was read from Mr. J. L. Pearson, R.A.:—“I have carefully examined the tower of your church, and I am of opinion that although the arch on its eastern side is greatly distorted by settlements, and by the consequent unequal pressure upon it, that yet it is not necessary to take it out and to rebuild it. The abutment on the south side of it has yielded considerably, but not in recent years, and the indication of cracks, to which my attention was directed, do not arise from any further giving way of this abutment, but are the result of the lateral spreading of the arch, in consequence of the stones in the outer rings not having any bond, and the spaces between them being filled in with loose rubble. This rubble, being compressed by the weight upon it has, as a matter of course, forced the masonry out of its place in the manner I have named, and that this is so may be clearly seen by the widening out of the arch. I would recommend that the walls of the tower should be grouted in with liquid Portland cement, or blue lias (Barron) lime and sand, immediately over and around this arch, and from both sides of it; that then, after carefully shoring it, one or two of the most defective arch-stones be removed and replaced with sound stone, and that the open joints elsewhere be wedged up, and solidly run in with cement. I would further recommend that the whole of the walls of the tower be treated in the same way, and in a regular manner, beginning at the bottom, and at every three feet in height be solidly grouted, and, if possible, on each side of the walls, care being taken not to disturb more of the facing than is absolutely necessary. It would be well to place the vessel containing the grout at some little elevation above the point where it is intended to introduce it, with a pipe attached to it, so as to have the advantage of the pressure which this elevation would give for forcing the grout into the walls. I am quite sure that if this process be well and carefully carried out, that then the tower will continue to stand as it now is for many future generations. The walls externally were undoubtedly intended to be covered between the dressed stonework with a thin coat of plaster, and I would advise that where this plaster has been removed that it should be replaced.” The work will be carried out in accordance with Mr. Pearson's suggestions.

### THE PRINCE OF WALES'S PAVILION AT THE HEALTH EXHIBITION.

THOSE who were fortunate enough to see the interior of the Prince's pavilion at the Fisheries Exhibition last year, and who have passed through the elegantly-furnished suite of rooms in the same building this year, will be in a position to contrast the different styles of decoration carried out on each occasion. It is not our intention to draw comparisons; it is sufficient for our purpose to give a brief description of the *ensemble* as it is now presented to us. Of the tens of thousands who have passed through these apartments since the opening of the exhibition we can scarcely suppose that a tithe of the number were able to appreciate the amount of labour bestowed upon the decorations, or the tone of artistic feeling that permeates the whole. The designs for the decorations and furnishing, as in the case of last year, were entrusted to Mr. Henry, of the Royal Windsor Tapestry Works, and it is only common courtesy to the talent of that gentleman to say that a master mind is apparent in the minutest detail; and to Messrs. Gillow, of Oxford Street, must be accorded an equal meed of praise for the manner in which the work has been carried out, and that few firms are probably capable of accomplishing in so satisfactory a manner. Entering through a pair of finely-executed wrought or hammered-iron gates, made by Barnards, Bishop & Barnards, of Norwich, and the same that did duty at the Prince's pavilion at the Paris Exhibition, 1878, we reach an octagonal entrance hall, in the Egyptian style, which has been popularly named the Arab room. The plays of the octagon disclose recesses containing luxuriously upholstered lounge seats, and the fireplace, while a circular recess and curtained divan is formed on the opposite side to the fireplace. Each of the openings is framed with the latticing of Meshrebuych woodwork, and a few Koran stands of the same material are placed about the room. A notable feature in this room is a four-fold screen of Turkish manufacture, made of a hard wood inlaid with pearl, the upper portion of the

panels having plate-glass panes. Turkish mirrors, also pearl inlaid brackets, &c., adorn the walls, and some well-executed hammered-iron jardinières find a place in the collection of ornaments. The fireplace is lined with blue and white Damascene tiles, a wrought-iron dog grate and fire-irons, evincing great taste in their design, completing this portion of the decoration. The general effect of this apartment may not commend itself to all English tastes, nevertheless there is much to admire in it. Most of the woodwork is painted in Indian red, and the dado, about 6 feet high, is of the same colour. A fretwork ornament, about 10 inches deep, surmounts this, and the walls are of a sage green, surmounted with a 12-inch frieze of gold leather paper. The ceiling is panelled by red wood mouldings, lined with gold, bordered with bands of blue in the panels. Tynecastle tapestry (so-called), though in reality this material is composed of a specially-made self-coloured canvas, which is decorated in any required style, forms the interior of the panels, and the material enters largely into the decoration of each of the rooms. Its effect is very attractive, and treated as it is here in a most artistic manner has much to recommend it. The electric light (Swan incandescent) is the mode of lighting carried out in each room, but this one is but sparsely provided with artificial light, which tones down the bright colouring to satisfactory proportions. To the left of this apartment is a small study, not generally shown to the mass of visitors. This is furnished in the Venetian style, the chairs (high-backed), cabinets, &c., being of ebony, inlaid with ivory in elaborate designs, the walls containing framed specimens of work carried out by Messrs. Gillow for notable people. The colouring of this unique room, dark olive-green woodwork, contrasts favourably with the furniture, and should not be missed by the interested visitor.

We next enter the dining-room, of noble proportions, in the style of early Louis XIV., which will no doubt commend itself to most English tastes, and is in direct contrast to the Egyptian room. White woodwork is employed here, the pilasters being painted in gold in shades of grey and blue. Tynecastle tapestry again enters largely into the decorative parts, and the ceiling, panelled and filled with painted ornament, is a study of itself. The floor is partly covered with a fine Axminster carpet of Persian design, the floor of this and the other rooms being of oak, with parquet borders. The chairs are covered with Windsor tapestry (*à la Gobelins*), the seat being of a conventional design, and the back comprising figures. Speaking of the Royal Windsor Tapestry Works, which are now engaging considerable attention, we understand as many as 15,000 shades of colour are at the command of the workers in this manufactory. There is a fine specimen of a marqueterie table in this room, the work of Messrs. Gillow. It is such an example as some of the old dealers would be glad to obtain, and is one that would enable them to make a large profit. This room is lighted by a ring of incandescent lamps, and four groups of three of the same order, and is most effective at night. Following on we reach the smoking-room, designed as a Greek temple, with alcoves and divans, and a central ottoman surmounted by a charming marble statuette of Eve, the lower portion of the work disclosing a serpent stealthily prying into a dove's nest. The statuette is voluptuously modelled, but is altogether a beautiful embodiment. This room is lighted by day by a well-arranged roof-light.

On the left of the smoking-room is a small retiring-room, the walls of which are covered with an Italian mezzara cloth, effective and very cheap, the chairs being of walnut wood and high backed.

We now pass outwards, and in doing so come upon a prettily-arranged conservatory with rockwork, plants, and water dripping from various parts. This has been arranged by Messrs. Dick Radclyffe & Co., of Holborn, a firm who are adepts in this kind of decoration. At night the electric light is brought into requisition, with charming effects, and the visitor lingers in this *salon* of flowers and artificial lighting loth to leave it.

### THE EDINBURGH THEATRE ROYAL.

PLANS and specifications have been prepared, and estimates received, for the reconstruction of the Theatre Royal, which was destroyed by fire on June 30 last. Mr. C. J. Phipps, who designed the former building, is the architect, and his plans show that the new theatre will be built very much on the same lines as its predecessor. Several new features are to be introduced, however, which are calculated to add to the safety and comfort of playgoers. First of all, increased facility is to be afforded on the higher levels of the building for entrance and egress by providing an additional staircase. The wall dividing the stage from the auditorium is to be of solid brickwork, and is to be carried up through the roof of the theatre; while all apartments of the nature of workshops and other necessary rooms are to be erected outside the main building. Last, but not least, the ventilating arrangements are to receive careful attention. As already indicated, offers have been given in for the reconstruction of the theatre, which Mr. Phipps has undertaken to have completed by the beginning of the pantomime season. As to cost, it is expected that this will be covered by the insurances on the old building, which amounted to 12,500*l*.

The Edinburgh Theatre Royal Company (Limited) have applied to the Dean of Guild Court for a warrant to remove and clear away the *debris* and other material from the building situated at the corner of Broughton Street and Little King Street, Edinburgh, and known as the Edinburgh Theatre Royal, and to reconstruct or reinstate the said building. The Court, accompanied by Mr. Cooper, the Burgh Engineer, Mr. Phipps, Mr. Heslop, and Mr. Officer, proceeded to inspect the ruins of the old building. The Lord Dean of Guild, after examining the walls, recommended certain things to be done in order to provide for their security. Part of the upper portions of the walls, it is stated, will have to be taken down and rebuilt, while the whole inside of the walls will have to be lined with concrete. The work of removing the rubbish and making the necessary preparations for the construction of the theatre will be commenced immediately.

## THE DESTRUCTION OF TIMBER AND STONE BY MARINE ANIMALS.

A LECTURE was delivered in Edinburgh on Tuesday on "The Boring of Marine Animals in Timber," &c., by Professor M'Intosh. The lecturer commenced by stating that the burrowing of marine forms was a feature familiar to every zoologist, for scarcely a dead shell could be dredged from the sea-bed that was not perforated by boring sponges. In the same way the surface of the limestone rocks of our southern shores was riddled by those sponges. So far as at present known, sponges bored only in calcareous substances, and there was a difference of opinion as to whether the agent in boring was the spicules or the soft annual jelly of the sponge. As regarded the boring of the purple sea urchins in gneiss and granite, the teeth were the main agency in the perforations. The group of annelids included many boring and burrowing forms, some perforating sand and others earth; while many bored in aluminous shale, sandstone, limestone, shells, and various substances. Each form, moreover, made a characteristic tunnel in the rock, so that the borer could in most cases be determined. None, however, bored wood, and though pieces of telegraph cable had been several times sent him, with accompanying annelids as the depredators, in no instance had the lecturer been able to connect them with the injury. There could be little doubt that those forms performed a useful function in the disintegration of dead shells, and in corroding the surface of calcareous and other rocks. The crustaceans and the molluscs were groups that were conspicuous in the perforation of wood and allied materials. Of crabs, the *Cheluria terebrans*, a form less familiar to Scottish zoologists than to their southern colleagues, was in xylophagous powers even more destructive than the common Scotch boring crab—the gribble—its excavation being considerably larger and more oblique. Though the gribble—*Limnoria lignorum*—must have been familiar to observers from a very early period, it was first described by Dr. Leach only in 1811, when Mr. Robert Stevenson, the celebrated engineer, found it burrowing most destructively in the large beams of Memel fir supporting the temporary beacon on the Bell Rock. Other logs of pine on the rock were reduced at the rate of about an inch a year, and the house timbers were so much destroyed by the gribble that many stood clear of the rock, supported only by the iron bolts and stanchions. It attacked all kinds of submarine woods; and the late Dr. Coldstream, Leith, had told them that in 1825 so extensive were the ravages of this creature that many of the piles of Trinity Chain Pier had to be replaced after four years' service, and studded all over with broad-headed nails from the base to the limit of high-water mark. Having described the structure of the gribble and its mode of boring, the lecturer said it had also acquired the habit of perforating the protecting envelopes and gutta-percha in which submarine telegraph cables were sheathed. The work of the burrowing crabs, however, was quite overshadowed by the far more serious encroachments which the boring shell-fishes were capable of making in timber and similar substances, as well as in rocks of various kinds. Professor M'Intosh pointed out the boring of the pholas and date shells in rocks, and went on to describe the destruction caused by xycophaga, which was to be seen in the deep water off the Firth of Forth and elsewhere in England and Scotland. It was, he said, a little bivalve shell-fish or mollusc, intermediate in structure between the stone-boring pholas and the strictly wood-boring teredo. There was very little externally in the wood attacked by this form to attract attention, except the presence on the surface of minute apertures, which indicated the points by which the young animals had entered; but on breaking open the wood the adults were found in smooth tunnels in every fragment large enough to afford a lodgment. The most conspicuous genus of wood-borer, however, was the teredo or shipworm, species of which occurred in every ocean. In the tube of the teredo the annelid (*Nereilepas*) was often found, and some observers maintained that it was the destroyer of the teredo, but the lecturer had some hesitation in subscribing to that theory. The very same species of annelid occurred abundantly along with the common hermit crab in the shells of the great whelk, and the association of annelids with other forms in tubes

or elsewhere was extremely common; but it was not for the purpose of preying on their neighbours, though the bodies of their hosts were in many cases softer than those of the teredo; they were what zoologists called messmates—dwelling in association with other animals. The object in life of all the species of teredo was to bore ceaselessly into timber, the tunnels in which varied from 1 to 2 feet in length in the case of the common teredo to fully a yard in the great teredo. Professor M'Intosh then gave a brief outline of the history of the teredo, which appeared to be mentioned for the first time in the "Knights of Aristophanes," and said that the French and Dutch suffered much more seriously from its ravages than we did. The theories that had been brought forward to explain the mode by which marine animals perforated material so different as wood, limestone, wax, granite, and aluminous shale, might be ranged round two great centres—the chemical and the mechanical. The advocates of the chemical theory seem to take it for granted that the borings occurred chiefly in calcareous substances, and with propriety, therefore, they made their solvent an acid. That notion, however, was unable to explain the perforations in media totally impervious to such action; while no trace of acid was found in many borers, and while present in some, it was likewise characteristic of other marine animals that did not bore. The mechanical theory, again, supposed that the animals perforated by means of shells or gritty particles in the case of molluscs, of teeth in sea-urchins, bristles in annelids, and horny processes in certain sea-acorns and gephyreans; but they were left in doubt concerning the extensive and wonderful excavations of the sponges, the bryozoa, and the rest of the cirripedes. Alluding to the methods of protecting submarine timber from the ravages of such animals as he had been speaking of, Professor M'Intosh said different kinds of wood were mentioned as being impenetrable by such boring action, but so far none had been successful. There were many preparations for the treatment of the wood before immersion. Soluble bitumen, silicated lime, and various compositions had each in turn been tried externally; while silicate of lime, creosote, and other fluids had been forced, under great pressure, into the tissue of the woods. The experiments of the Dutch Commissioners, who investigated the matter, had led them to the conclusion that no external protection other than metallic sheathing or the studding of the wood with broad-headed nails would be successful in resisting the attacks of these borers, while the only impregnation they found reliable was creosoting. In conclusion, Professor M'Intosh pointed out that while the Dutch, French, and other Commissions had done material service in regard to the best means of protecting timber from the attacks of borers, the subject was by no means exhausted. On the contrary, it would form a fitting object for research at the marine laboratories which at last, he was glad to say, were being established on our coasts. That ceaseless boring of wood was not, however, an unmitigated evil. The masses of timber swept seawards by many foreign rivers would prove a serious impediment to navigation if the marine borers did not slowly but surely accomplish their dissolution. In the same way the relics of many a ship in the depths of the sea were disposed of, and even utilised for the increase of animal life, which was, directly or indirectly, connected with the food of fishes, and, consequently, with the welfare of man.

## SANITARY INSPECTION IN GLASGOW.

AT the last meeting of the Glasgow Dean of Guild Court the Lord Dean of Guild inquired of Mr. Whyte, Assistant Master of Works, if a portion of the fees of the Court might not with advantage be applied as salary to an officer whose duties would be the inspection of the drains of houses as they were being built. Three hundred and fifty pounds had been received last year as fees of the Court, and his lordship thought it would be well to take that step in the direction of improving the sanitary conditions of the houses being put up. Mr. Whyte said the want of such an officer had been felt; but he feared very much that unless the Court had the power themselves to lay the drains there would be very little chance of the work ever being properly done. If it met with the approval of the gentlemen of the Court, the Lord Dean said he would bring the matter before the Board of Police to get the fees of this Court—which would otherwise go into what was called the Town Clerk's Fee Fund, a fund already running over—applied, and he thought beneficially applied, to maintaining an official to superintend the drainage arrangements of new buildings sanctioned by the Court. Then, in the event of the drains not being made properly, the Court could refuse to permit the occupation of the property until the drains were put right. It was suggested that one officer could not overtake all the work, and the Lord Dean mentioned that, although 224 plans of new buildings had been submitted to the Court during the past year, each of these had not separate drain plans, and he thought one man constantly employed could inspect all the tenements as they were in course of construction. The return he had received from Mr. Whyte indicated a comparatively small amount of buildings for occupation—last year he believed there was not one house built of

six apartments, and one-half of the houses that had been built had only two apartments. Nothing was so discreditable to the city as the state of the drains, and, speaking from personal experience of houses in Park Terrace, he said there was scarcely one of them that, on inspection, was not found in an imperfect and unhealthy state as regards the drainage arrangements. Mr. Howat gave it as his opinion that the inspection of drainage works would never be satisfactorily attended to until it was done by one of the city officials. Other members of the Court spoke in favour of something being done in the way indicated by the Lord Dean.

### CAST-IRON BRIDGES.

A REPORT by Colonel Yolland to the Board of Trade giving the result of his inquiry into the circumstances connected with the fall of four cast-iron girders of a bridge carrying the Camberwell Grove Road over the London, Chatham and Dover Railway at the Denmark Hill Station, says that, looking at the fact that six of these girders cracked in December last, and that four others of the same class and dimensions broke and fell on May 29 last, fortunately without producing any serious accidents, endangering the safety of the public travelling along the road or underneath it on the railway, he thought the prohibition which the Board of Trade had already issued against the use of cast-iron beam under-bridges on railways should now be extended to the use of the same material in the construction of beam bridges for carrying roads over railways, rather than to wait for some very serious accident occurring before issuing such prohibition. It is well known that cast iron cannot be relied on, and that beam bridges constructed of this material may give way at any moment without any previous indication or warning being given.

### WORKMEN'S DWELLINGS.

A COMPANY called the National Conservative Industrial Dwellings Association (Limited), with an authorised capital of 999,900*l.*, has just been incorporated for the purpose of constructing sanitary dwellings for artisans, labourers, and others, and of enabling working men to become the owners of their own houses, cottages, or agricultural allotments by a system of payments extending over a term of years. The association, which will own freehold property only, and be conducted on sound and strict business lines, will not confine its operations to crowded neighbourhoods. Besides erecting improved sanitary dwellings to populous districts, it will construct cottage residences at low rents in the suburbs, and as a special feature will, by making arrangements with the railway companies, comprise the cost of the tenants' season tickets in the rents. In country districts the association proposes to build cottages for agricultural labourers, and to acquire land for subdivision into allotments. In order to identify the association with the working classes and to give them a share in its control, a large amount of industrial stock will be issued exclusively to working men. It is claimed that the association will offer an absolutely safe security for the investment of small savings, and thus foster self-help among artisans and labourers, as much by improvement in their personal and domestic surroundings as by placing within their reach the means and the incentives for the cultivation of provident habits. It may be added that the association is promoted by gentlemen closely connected with the Conservative party as an earnest of the zeal and practical interest taken by them in the social well-being of the working classes.

### TOWNS IMPROVEMENT.

**Bradford.**—A recreation ground on Bradford Moor was opened on Saturday last. The recreation ground is 15 acres in extent, so that the corporation, after making this apportionment, had on hand over 30 acres of ground. Some of this has already been disposed of, and it is not improbable that in a few years most of the land will be utilised by house builders. The recreation ground, which is rectangular in form, is enclosed by a substantial boundary wall, 7 feet in height, except on that side nearest to Killinghall Road and the upper portion of the eastern side, which is furnished with wrought-iron railings 4 feet in height, fitted with ashlar coping. The tenders for laying out the grounds, &c., amounted to 4,692*l.* The plans were prepared by Mr. J. H. Cox, the borough surveyor, and the contracts for the various works have been held by the following firms:—Formation of the ground, drainage, and planting, Mr. Lister Kershaw, of Brighouse; masonry, Mr. J. Pratt; joinery, Messrs. J. Wilson & Sons; plastering, Mr. W. H. Hargreaves; plumbing, Mr. C. Howroyd; painting, Mr. W. Hird; slating, Messrs. Hill & Nelson; asphaltting, Mr. W. Bullough. The heating apparatus for the conservatories has been supplied by Mr. Walton, of Low Moor. The chief feature of the ground is a central stretch of green sward, 260 yards

long by 145 yards broad. At each side of this is a large alcove of Classic design, affording a good view over the whole of the ground. These buildings are of stone, lined inside with pressed bricks, covered in with blue Westmoreland slates, and surmounted by ornamental cresting, the fronts being of ornamental woodwork. The dimensions of each alcove are 37 feet by 16 feet. At the lower portion of the ground there is an extensive range of green-houses. In the centre is a conservatory, 21 feet square, having upon each side a greenhouse, 32 feet by 11 feet, with potting-houses, heating-chambers, tool shed, and gardener's store-room behind. The conservatory is octagonal in form, and is covered with plain sheet-glass, having one of Boyle's patent ventilators at the apex of the roof.

### SCHOOL BUILDINGS.

**Horwich.**—The corner-stones of a new Independent Methodist Sunday school—which is being erected immediately behind the chapel—have been laid. The new school is designed to accommodate 400 scholars. The building will be of local pitch faced stone, and the woodwork will be of pitch-pine, varnished throughout. The roof will be open timbered, and the ventilation will be secured on Boyle's principle. The heating will be by hot-water piping, by Messrs. Crumblehulme, of Derby Street, Bolton. Mr. Wilkinson Brierley, of Higson Street, Bolton, does the joiner's work, and Mr. Thomas Harrison and Mr. Wilkinson, both of Horwich, do respectively the stone work, plastering, painting, plumbing, and glazing. Mr. T. E. Smith, of Wood Street, Bolton, is the architect.

**Kettering.**—St. Andrew's new schools have been opened for use. They are situate near the church, and are built of Glendon brown stone with Box ground-stone dressings. The roofs are slated. Internally the walls are lined with white brick. The roofs are open and stained and varnished. The main room is 60 feet by 20 feet, with wings at one end and large classroom at other. The playgrounds are asphalted. There is a bell turret outside, and the whole forms a good group and an improvement to the neighbourhood, where the schools are much wanted. The cost, exclusive of land, has been about 1,300*l.* The works have been carried out under the superintendence of Mr. R. W. Johnson, architect, of Kettering and Melton, by Mr. George Henson, builder, of Kettering.

**Stanningley.**—The memorial-stones of a new Sunday-school, to be erected in connection with the Eleven Lane Ends Primitive Methodist Chapel, have just been laid. The school is being built of brick, with stone dressings, from designs prepared by Mr. C. S. Nelson, of Leeds, and is estimated to cost 750*l.*

**Stockton.**—New Catholic schools have been opened in Disraeli Street, Stockton. The schools have been erected from the designs of Mr. E. E. Clapham, architect, of Stockton. Accommodation has been provided for 500 children. The cost of the buildings has been about 3,000*l.*

### CHURCH BUILDING AND RESTORATION.

**Grays.**—The foundation-stones of the Wesleyan chapel, in course of construction at Grays, have been laid. The chapel, which will cost about 3,000*l.*, is being built on a site in the London Road, by Mr. William Wood, of Chelmsford, from the designs of Mr. C. Bell, of Dashwood House, Broad Street, E.C. It will be constructed of stock bricks, with stone dressings.

**Haslingden.**—The foundation-stone of the church of St. John, Stonefold, Haslingden, has been laid. The church will consist of nave, aisle, chancel, vestry, and organ-chamber, with porch and bell-turret. It is to be built of Yorkshire stone with oak fittings throughout. The plans have been prepared by Mr. Basil Champneys, architect, London.

**Hereford.**—The corner-stone of the new nave and south aisle of St. Peter's Church has been laid. The church of St. Peter's dates from the year 1060. With the exception of the chancel and the tower, which were only restored a few years ago, the entire structure, which had become greatly decayed, has been demolished, and a new nave, with south aisle, is in course of erection from designs by Mr. Nicholson, diocesan architect. The estimated cost of the restoration is 3,400*l.*

**Heybridge, Essex.**—Heybridge Church is being restored. The walls are in a bad condition outside, and a large outlay will be entailed in their repair. The tower, a very low one, is also in need of restoration. Several of the windows in the nave and chancel of the church have from time to time been blocked up, and it is proposed to renew these, while the east window will be restored. The work is being carried out by Mr. Gozzett, builder, of Woodham Walter, under the direction of Mr. E. Christian, architect.

**London.**—During the past few weeks considerable improvements have been made in the interior of the parish church of St.

Sepulchre, Holborn Viaduct. Two Gothic lobbies have been added, one upon the north and another on the south entrance doorway from the porch. They have been designed so as to accord strictly with the ancient architecture of the tower and vestibule, as rebuilt in 1450 by Sir John Popham. They are constructed entirely of oak panelling, the upper portions being formed of richly-carved open tracery, filled with plate glass, and large and elaborately carved cornices. The doors are made to swing both ways. The tracery-work is fifteenth-century Gothic. They have been erected by Mr. John Emery, of the Gray's Inn Joinery Works, 15 Theobald's Road, W.C. The architect is Mr. Arthur Billing, F.R.I.B.A., of Bank Chambers, Tooley Street, S.E.

**Morecambe Bay.**—The foundation-stone of a new church for the village of Silverdale, at the head of Morecambe Bay, has been laid. Plans have been prepared by Mr. W. Ball, of Manchester, and the contract for the erection of the new church let to Mr. James Hatch, of Lancaster, the amount being about 4,600*l*. Accommodation will be provided for 336 worshippers.

**Netherton.**—The foundation-stone of the church of All Souls, Netherton, near Maryport, has been laid. Mr. C. J. Ferguson, F.S.A., of Carlisle, is the architect. The style of the church is Gothic, and will consist of north and south transepts and nave, with a vestry and organ-chamber. Its length inside will be 150 feet, and breadth 64 feet, and the edifice will accommodate 700 people. It will be built of red sandstone from the Netherhall quarries. The estimated cost is from 5,000*l*. to 6,000*l*.

**Old Shoreham, Sussex.**—It is contemplated to make certain alterations and improvements to the nave, &c., of the ancient parish church, situate by the banks of the river Adur, and plans and estimates for the same have been furnished by Mr. Arthur Loader, architect, of Brighton.

**Richmond, Yorks.**—A Congregational church was opened on Wednesday at Richmond. The buildings comprise church and chancel, recess for organ, with present accommodation for 250 persons, deacons' and ministers' vestries, school for 150 children, lobbies, and the usual outbuildings. Provision is made for an end gallery, which will give a further accommodation in the church of 80 sittings. Externally the building is of local lines in regular courses, freestone dressing being largely introduced. The roofs are covered with Westmoreland green slates. At the south-west angle there is an octagonal tower with long traceried belfry windows, moulded and embattled coping. The style is Perpendicular, harmonising with many old buildings in the town. The architects are Messrs. Clark & Moscrop, of Feethams, Darlington.

**Southwram.**—A new organ-chamber is being added to St. Anne's Church, and other alterations are shortly to be proceeded with. A semi-octagonal baptistery will be built on the north side, lighted with three lancet-headed windows. The alterations are carried out under the direction of Mr. W. S. Barber, architect.

**Whitwood Mere.**—The foundation-stones of the Potteries Mission Church, Whitwood Mere, Castleford, have been laid. The church will consist of nave, chancel, vestry (with heating chamber under), and porch, and is to be constructed of brick, with pressed facings and stone dressings externally and internally, with open-timbered roof of pitch pine, having hammer-beam principals, moulded purlins, and battlemented cornice, and will be covered with boards, roof felting, and Welsh slating. A *flèche* on roof will serve the double purpose of bell turret and foul air extractor. The chancel arch will be formed in three orders, of brick, with moulded stopped angles. The windows will be glazed with cathedral glass in leaded lights. The heating will be performed by means of hot water. The church will seat 250 persons. The architects are Messrs. Perkin & Bulmer, of Leeds.

## NEW BUILDINGS.

**Artisans' Dwellings, Bloomsbury.**—A great improvement has just been completed on the estate of the Duke of Bedford by pulling down the houses on each side of the narrow passage known as Woburn Court, which leads from Duke Street to Streatham Street, and making a new street in continuation of Streatham Street up to Duke Street, in a parallel line with Oxford Street. On the north side of the new street a range of artisans' dwellings have been erected, containing twenty tenements, each having a living-room, two bedrooms, scullery, and water-closet, very well lighted and ventilated, with a large washhouse and laundry on the basement, fitted up with every convenience. The houses, which are of a more than usual ornate character for this class of building, were designed by Mr. Henry M. Eyton, architect, of Ipswich, and carried out by Mr. Oliver T. Gibbons, contractor, of Dashwood House, Old Broad Street, at a cost of a little over 5,000*l*.

**Bradford.**—The memorial-stone of the building to be erected in extension of the Bradford Infirmary will be laid on the 30th inst. The extension is to consist of a detached wing between the eastern end of the present building and Lumb Lane. The southern end of this wing will be in line with the general front of the present infirmary, and its northern at six yards from the boundary

of the estate there. The distance between the old and new buildings at the narrowest point will be about 40 feet, the two being connected only on the basement and ground-floors by corridors or open arcades. The main block of the new building will measure externally 126 feet 6 inches by 35 feet, the height being the same as that of the present building. The rooms on the basement will be light and airy, and suitable for use as day-rooms, being surrounded by a wide and open area. The ground-floor will comprise a day-room and bedroom each for two head nurses, and five small wards for cases which may require separate treatment. The first floor will form one large ward for twenty-six beds, the cubic space allotted to each being nearly twice as much as in the present building; and the second, or uppermost floor, will be reserved entirely for children, and it is estimated that thus accommodation for thirty-four children will be provided. The total number of beds will be from seventy to eighty, in addition to those in the present building. Architecturally the building will correspond with the present one, but the window area in all the wards will be much larger. Each ward will be warmed by open fires, with hot-water pipes added when the weather is very cold. The floors and the roof will be of concrete, the former, of course, having an upper flooring of boards. In another part of the grounds there will be provided isolated wards for the treatment of any infectious cases that may arise. Messrs. Milnes & France are the architects.

## WORKS IN PROGRESS.

**The Imperial Stone Company** has been entrusted with the completion of the paving of Marlborough House stables for H.R.H. the Prince of Wales, with their noted "Petrosilicon," which is fast becoming the favourite flooring for farm buildings, stables, kennels, tennis-courts, &c.

**Ventilation of Public Buildings.**—Messrs. Robert Boyle & Son, 64 Holborn Viaduct, and Glasgow, have just applied their patent self-acting air-pump ventilators and system of ventilation to the Inland Revenue Department, Somerset House; Gresham Hall, Brixton; University College, Bangor, North Wales; Council Room, Barnsley; Masonic Club, Landport; Alexandra Club-house, Southend; Free Library, Northwich; new Offices, Edmonton Local Board of Health; York Institute, York; Carr & Company's new stables, Carlisle; new factory for the Ekman Pulp and Paper Company, Northfleet; Lillehurst, Simonstown Hawes, Shrubland Park, and Muncaster Castle, residences of the Duke of Sutherland, Lord Wharneckcliffe, Sir G. Brooke Middleton, Bart., and Lord Muncaster.

## GENERAL.

**The Wolverhampton Exhibition** is to be kept open until the end of October. About 200,000 persons have paid for admission since the opening, and 2,000 season tickets have been purchased.

**A Bronze Statue of Sir Bartle Frere**, which is to be erected in the Thames Embankment Gardens, at a cost of 2,700*l*., has been entrusted to Mr. Brock, A.R.A., for execution. It will be 11 feet high, and will stand on a granite pedestal near the statues of Tyndale and Sir James Outram. The work is already commenced.

**Mr. W. Pettit Griffiths, F.S.A.**, died at his house in London on Sunday last. In addition to his practice as an architect, Mr. Griffith was the author of a great many papers, and of a work on the relation of geometry to design.

**The Committee of the Oldham Free Library and Art Museum** have decided to proceed with the furnishing of the permanent structure, and have instructed Mr. L. Booth, of Manchester, to prepare all the necessary designs for the work required to be done.

**Mr. Joseph Crossland**, borough magistrate and chairman of the Huddersfield Banking Company, has offered a donation of 5,000*l*. towards the cost of building a free library for Huddersfield, if the remainder of the funds requisite are raised by subscription.

**Mr. T. A. Hearson, R.N.**, of the Royal Naval College, Greenwich, has been appointed Professor of Engineering at the Royal Indian Civil Engineering College, Cooper's Hill, in succession to Professor Unwin; lately appointed to the City and Guilds Technical Institute, South Kensington.

**Galvanised Iron** is largely used in New South Wales for fencing, roofing, and similar purposes. During the last three years 46,114 tons have been imported.

**A Large Casting** has just been successfully completed at the Royal Gun Factories, Royal Arsenal, Woolwich. The casting was of steel, and was for the manufacture of an hydraulic jack. The metal was fused in two crucibles; one contained 16 tons and the other 6 tons, together 22 tons.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, SEPTEMBER 20, 1884.

### EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

### TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—“Contract Supplement to THE ARCHITECT.”

GRUNDY'S PATENT  
WARM-AIR  
VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent  
consist in the heating surface being greater than any  
other Fire-grate introduced to the public. It is very  
simple in construction, and is made in the form of a Stove,  
the back of which is semicircular in shape, with gills  
behind and smoke-nozzle on top, all cast in one piece.  
The same can be attached to any design of a Register or  
Stove front. It is very suitable for schools, class-rooms,  
waiting-rooms, hospitals, offices, dormitories, and dwelling-  
houses, from the cottage to the mansion. Design and  
specification post free on application.

TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W."  
"June 10, 1884."  
"SIR,—I have much pleasure in testifying to the  
efficiency of your patent Warm-Air Fire Grate. It has  
been very successful, and given every satisfaction where I  
have used it."  
"Yours, &c."  
"JAMES WEIR, F.R.I.B.A."

"To Mr. Grundy,"  
"Baptist Chapel, Clapham Common, London. Richard  
Webb, Pastor, 10 Grafton Square."  
"February 15, 1884."  
"DEAR MR. GRUNDY,—I have pleasure in testifying to the  
excellency and efficiency of your patent Fire-Grate. It is  
the most charming invention for heating a large room I  
have ever known. I shall have pleasure in showing it to  
anyone who wish to have their schools or rooms pleasantly  
and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,  
July 1884.

"DEAR SIR,—I have very great pleasure in stating that  
the first stove, or patent warm-air ventilating fire grate,  
adopted by me in school at Seaton, and a second in a  
Cocoa Palace, have given such satisfaction that I now  
order eleven to be inserted in New Upper Grade Schools in  
course of erection at West Hartlepool. They are the most  
economical, efficient, and easily managed stove at present  
before the public."  
"Mr. John Grundy."

# BELL'S ASBESTOS.

## BELL'S ASBESTOS FLOORING FELT.

This article is manufactured from specially prepared Asbestos fibre, and by its use any building can be rendered comparatively fireproof at a very small cost. This material should be used as a substitute for brown paper under the carpet, and it can be taken up and relaid as often as required; it may be laid between the flooring boards, on the ceiling before plastering, and on the walls. Doors of pine or other wood should be so constructed as to have a sheet of the felt in the centre, so that either side being burned the other remains intact. In houses so protected fires would be localised to the rooms in which they originate. Asbestos felt, being a non-conductor of heat, is superior to any other sheathing, and used under slates has no equal. It yields no dust, lies quite flat, is soft to the tread, and its low cost places it within the reach of everybody. Made in rolls of 36 inches wide.

## BELL'S ASBESTOS BOILER AND PIPE COVERING COMPOSITION.

For coating every class of steam pipe and boiler. Non-combustible, and easily applied when steam is up; adheres to metals and preserves them from rust; prevents the unequal expansion and contraction of boilers exposed to weather; covers 50 per cent. more surface than any other coating, and is absolutely indestructible. It can be stripped off after many years' use, mixed up again with 20 per cent. of fresh, and applied again. The composition is supplied dry, and only requires to be mixed with water to the consistency required for use.

A horizontal boiler, 17 ft. 6 in. long, 15 H.P., gave the following results:—

Temperature on Plates .. .. 186 deg.  
" " Covering .. .. 94 "

One ton of coal was saved per week, and, although the fire was raked out every evening 20 lbs. of steam were in the boiler next morning.

The following testimonial refers to this covering:—

Offices of Wimbledon Local Board, Wimbledon, Nov. 28th, 1883.  
Dear Sir,—It may interest you to know that we save exactly 40 per cent. in fuel through using your covering.—Yours truly,  
W. SANTO CRIMP, C.E., F.G.S.

**BELL'S ASBESTOS PAINT**, for floors, stairs, and all interior woodwork, to prevent the spread of fire. This paint is especially useful in cotton mills, and in fact in all factories and buildings exposed to risk from fire. It is quite free from poisonous ingredients, and is both easily and cheaply applied. Bell's Asbestos Paint has, on several occasions, done great service in preventing the loss of life and property. The great fire in Buchanan Street, Glasgow, in November last, produced the following testimony to the value of this material:—

Offices of the *Glasgow Herald*, the *Weekly Herald*, and the *Evening Times*,  
Mr. John Bell.

Sir,—As one of the means that helped to save our buildings extending from Buchanan Street to Mitchell Street from the recent great fire, I think it fair to say that your Asbestos Paint, which was applied to the outside hoist of the *Evening Times* case-room and other portions, gave valuable proof that it materially aided in resisting the flames from the immediately adjoining tenement while the fire was rapidly destroying it and threatening us in the most serious form. Since the fire, and to assure myself further of the value of the Asbestos Paint as a fire-resister, I placed a piece of wood, with your paint put on more correctly than in our case, into one of our furnaces, with the result that it was brought out without a fibre of the wood being touched, while similar pieces of wood, thrice coated with Irish Lime, at once got into a flame.—Yours truly,  
(Signed) ALEX. SINCLAIR.

**BELL'S ASBESTOS SASH-LINE CORD** is unaffected by heat and damp, and renders unnecessary the use of metallic wire and chains. Ropes made in the same form have great tensile strength, and being indestructible by fire are of incalculable value for fire escapes.

## BELL'S ASBESTOS.

The goods of this house are of the highest quality only, and no attempt is made to compete with other Manufacturers by the supply of inferior materials at low prices. All orders must be sent direct to the undermentioned depots, and not through agents or factors.

## BELL'S ASBESTOS AND INDIA-RUBBER WOVEN TAPE AND SHEETING.

For making every class of steam and water joint. It can be bent by hand to the form required, without puckering, and is especially useful in making joints of manhole and mudhole doors on boilers; also for large "still" joints, where boiling fat and steam have to be resisted. It is kept in stock in rolls of 100 feet, from  $\frac{1}{4}$  in. to 3 in. wide, and any thickness from  $\frac{1}{8}$  in. upwards. Manhole covers can be lifted many times before the renewal of the jointing material is necessary. The same material is made up into sheets about 40 in. square, and each sheet bears the trade mark, without which none is genuine. It is very necessary to guard against imitations of this useful material, and to secure themselves against being supplied with these less useful articles at my price, users are recommended to see that every 10-ft. length of the Asbestos Tape purchased by them bears the trade mark.

## BELL'S ASBESTOS CEMENT

for the backing of firebricks and furnaces. The use of this fireproof material saves the expense and annoyance occasioned by the repairs so constantly required in the firebricks and kitchen ranges of private houses. Any labourer accustomed to handle other cements can apply this.

**BELL'S ASBESTOS BOILER PRESERVATIVE.**—This useful mixture, by absorbing the free oxygen that is in the water, entirely checks pitting and corrosion. It also disintegrates incrustation so immediately as to prevent its adhering to the plates. Not only is a great economy of fuel effected by keeping boilers clean, but the risk of having the plates burned is thereby obviated. It has been computed that 1-16th inch thick of incrustation causes a waste of 15 per cent. of coal;  $\frac{1}{8}$  inch thick, 60 per cent.; and  $\frac{1}{4}$  inch, 150 per cent. Thus the Preservative avoids the great risks which are inseparable from scaled plates, lengthens the life of a boiler, and covers its own cost a hundredfold by economy of fuel. It is entirely harmless, and has no injurious action on metals. It can be put into the feed tank or boiler, as may be most convenient. Sold in drums and casks bearing the trade mark, without which none is genuine.

**BELL'S PURE ASBESTOS CLOTH**, for protection against the spread of fire. Iron curtains warp, and in the great emergency of fire will often be immovable. Asbestos cloth, being incorruptible, will remain strong and flexible for an indefinite period, and will stay the progress of a fire and the passage of smoke longer than any other known material. This cloth is also extensively used in Maignen's unequalled water filters, for which a gold medal and diploma of honour were awarded by the Special Commission appointed by Her Majesty's Government to receive the reports of the International Juries at the Fisheries Exhibition. By special arrangement with Mr. Maignen, his filters for houses, factories, and towns are supplied by this firm.

**BELL'S ASBESTOS BLOCK GAS FIRES.**—The Asbestos Block Gas Fire is formed by placing inside the ordinary grate a hollow block (burner), composed of Asbestos, and perforated. An iron sole-plate, with a single gas burner, is fixed at the bottom of the block. After being lighted a short time, both the block and asbestos fuel throw out intense heat.

**BELL'S ASBESTOS FUEL**, for gas fires. This genuine Asbestos Fuel is composed of the finest hand-picked Asbestos, and its weight is about half that of any other Asbestos fuel.

**BELL'S SPECIAL LONDON-MADE ASBESTOS MILLBOARD**, for dry steam joints, made of the best Asbestos fibre, is well-known for its toughness and purity, and is absolutely free from the injurious ingredients frequently used to obtain an appearance of finish, regardless of the real utility of the material. Made in sheets measuring about 40 in. square, from 1-64th in. to 1 in. and  $\frac{1}{2}$  millimetre to 25 millimètres thick. Each sheet bears the Trade Mark.

# The Architect.

## TWO ART-REFORMERS.

LAST Saturday, in two of the chief provincial cities of England, two of the leading authorities of the day on artistic criticism delivered forcible and demonstrative discourses on what may fairly be called highly sentimental, indeed sensational, views of the subject, namely, Mr. BERESFORD-HOPE at Birmingham, and Mr. WILLIAM MORRIS at Manchester. In both instances we may regard the addresses in question as directly challenging the common sense of the many to a public controversy with the uncommon sense of the few. The challenge, we need scarcely say, will not be accepted; it never is. Whether the transcendental doctrine in such a case happens to be conservative or reactionary, as Mr. HOPE's may be said to be, or revolutionary, as Mr. MORRIS's confessedly is, it is always found to be equally vain to expect that the slow but irresistible current of general opinion will consent to pause for its discussion. Mr. HOPE well knows that this great governing influence has long left him in the rear; and Mr. MORRIS probably sees no less clearly that the direction he would wish it to take it will never take. Still it does not at all follow that those who make it their business, or their pleasure, to watch the movement of progress may not derive both enjoyment and profit from the contemplation of even the most visionary of such manifestations.

Mr. BERESFORD-HOPE, "romantic, chivalrous, and unconventional," is now the last of the more learned and accomplished representatives of the principle of Gothic art pure and simple, Mediævalism at any price, the subordination of the free and restless intelligence of the close of the nineteenth century to the dogmatic *régime* of the thirteenth. He takes for his subject, in such a town as Birmingham, and on such an occasion as a meeting of that most modern of all institutions, the Social Science Congress, "the strength and the weakness of art," and he cannot help attempting in effect to show, even in circumstances apparently so unfavourable, that the weakness of art is exemplified in the work of modern times as a whole, and the true strength of art in the acceptance of such models as "the paradisiacal groups of FRA ANGELICO." The reason of this, we are told, is the spirit of self-seeking by which modern artists are animated, as contrasted with the self-forgetfulness of the men of old time, who regarded themselves only as the humble instruments of an influence "from on high." Immorality on the one hand, and morality on the other, are the consequences; and even in such a thing as architecture Gothic is the moral and self-forgetful master of symmetry, while Classic is its immoral and selfish slave. The substratum of truth which underlies this scheme of criticism need not be overlooked by those who happen to be qualified to discern it, if the regret that it should not be turned to some more intelligible account may still be acknowledged.

But, in order to reach the good sense of this matter, it is absolutely necessary nowadays to substitute for the phrase "Gothic"—for it is only a phrase in an argument of this kind—the much more comprehensive idea of all such art as exhibits amongst its other principles those which have been discovered to constitute the merit of Gothic. It is also necessary to give a far wider and more liberal range to the influence of the artistic motive than can ever be identified with the narrow precedents of academical galleries of the Old Masters. It is equally necessary, once more, to content one's self with the less figurative uses of common language; for, however strong may be the temptation to employ plain words like "morality" and "immorality" to suggest profound and mystical contrasts in the handling of a blacklead pencil or the construction of a parlour window, the plain people of to-day cannot be prevented from losing a little temper over such loose terminology, if only on the simple ground that the resources of the dictionary have not been made available for their benefit.

If it were within the limits of politeness to tell the artisans of Birmingham that the weakness of art is most conspicuously

manifested in the qualities expressed by the term "Brummagem," then its strength might perhaps with sufficient certitude be described as consisting in the happily increasing feeling of the day in favour of those elements which are the reverse of mere cheapness and makebelieve, and which, if not questions of "morality," are at least points of honesty in design and workmanship. Even the men whose ingenious lives are passed in the fabrication of the thousand-and-one wooden nutmegs of one kind or another which Birmingham has the credit of producing "for the market," cannot possibly help feeling how much happier it would be to be engaged in work that could hold its head up as honest work; and the real strength of art in England at the present time, we venture to submit, is to be found in the fact that this view of the case is actually being entertained more and more every day, alike by teachers and critics of art, by a purchasing public, by earnest manufacturers, and by earnest workmen. No doubt the connoisseur of a reflective turn of mind, with a slightly paradoxical poetical learning, may find a not unenviable delight in working out the analogies of the matter which the FRA ANGELICOS of rude but honest days of old may suggest, but a much more healthy exercise for Englishmen of to-day may surely be found in the far wider survey of the whole empire of gracious device which now pays homage to the genius of artistic impulse, and in the resolve that, step by step, this empire shall be extended in area by the conquest of fresh territory, and confirmed in loyalty by the cultivation of all the generous sentiments which art at its best delights to encourage.

Mr. MORRIS at Manchester, with a boldness in no way less than that of Mr. HOPE at Birmingham, assails at the headquarters of political economy the whole theory of political economy as applied to the arts. If Mr. HOPE's chivalrous feeling leads him to deplore the self-assertiveness of the typical artist of our day, and to long for the time—if such a time be possible now—when the worker will entirely forget himself in his work, the romanticism of Mr. MORRIS declares for an equally transcendental and perhaps a still more impracticable ideal, in which he sees the worker recognising no "master" but himself, no "employer" but the great commonwealth of art, no trading considerations whatever but the very simple plan that he who makes a thing with his own hands shall bestow it at his own pleasure in exchange for what others make in like manner. By not a few hasty persons this doctrine is disposed of by a single word; it is "Socialism," and Socialism is a word so very ugly that no more need be said. But this is not only hasty but unworthy criticism. What political Socialism may be in any practical form we do not care to inquire; it is enough, perhaps, to regard it as one amongst the many groans of humanity which have always expressed, in one way or another, the dissatisfaction of those who have not with the superior condition of those who have. Mr. MORRIS's doctrine, as we understand it, is altogether different from this. Like Mr. HOPE, he denounces, no doubt, a modern system; and he pleads for the revival of an ancient one: Mr. HOPE would have the academical English artist revert to the productions of FRA ANGELICO, and, by saturating his intelligence with their simplicity, to attain to a frame of mind in which the beauty of self-negation shall become the essence of his own character and the essence therefore of his work. Mr. MORRIS would have the unacademical English artisan attain something apparently like the same end, and by what seems to be something like the same process, inasmuch as the example of Mediæval antiquity is still in question, with the substitution of ancient simplicity for modern complexity. But in reality the end is not the same, nor the process the same. Mr. MORRIS complains of "Brummagem" art as Mr. HOPE does, but he would undermine it, not by reverting to FRA ANGELICO, but by removing the Manchester middleman. Perhaps we may say he would simply abolish, as regards art-workmanship, the whole machinery of commerce. He would at any rate return at once to the system—the crude system we should now call it—of the Middle Ages, when every artisan was a small master, and there were no great factories, wealthy firms, joint-stock companies (limited), brokers, buyers, salesmen, agents, but the little workshop only of the thoughtful and skilful craftsman, where nothing was done but craftsmanship of the best, nothing done except in leisure and for the love of it, nothing sold but for the honest penny, in simplicity, in modesty, and in such true manly dignity as can never live in an atmosphere of nigger-driving manufacture and counting-house artifice. A dream this, no doubt, which is never to be realised, but one

which nevertheless it is pleasant to contemplate. And profitable, too; for, amongst the byways if not the highways of modern artisanship, may we not hope to see as the result of such dreaming, if not a return to the simplicity of the old time, some reform of the complexity of the new that may be equally beneficial?

It is always a pleasure to listen to the opinions of thoughtful, earnest, and accomplished men who are bold enough to be thus candid with the faults and foibles of their own generation. This world of ours has done a good deal in its day, but it has much more to do; and, even when reforms are the most impracticable, they may be none the less worthy of their share of attention.

## THE SOCIAL SCIENCE CONGRESS.

[BY A CORRESPONDENT.]

THE Art Department of the Social Science Congress just ended at Birmingham has more than held its own among those whose numerous meetings have been contemporaneously held in that town from the 18th to the 23rd of this month. Indeed, the interest evoked by its proceedings has increased steadily from day to day, until at last its place of meeting became filled to overflowing, somewhat, it is to be feared, to the prejudice of other departments, whose deliberations, however valuable, proved less popular.

The tact and humour of the President of the Art Department, the Right Hon. A. J. B. BERESFORD-HOPE, M.P., conspicuously displayed in the early days of its session, no doubt contributed in no small degree to the success which on all sides was allowed to have attended its proceedings, and excellent order was preserved throughout in consequence, although many of the subjects considered in it were of a nature to admit of, and certainly evoked lively discussion and much variety of opinion.

Mr. JOHN P. SEDDON opened its proceedings on Thursday, the 18th, by answering very distinctly in the affirmative the special question which had been entrusted to him to deal with, that, namely, as to whether elementary instruction in drawing ought to be made an essential part of the national education. The same view was subsequently maintained in other papers by Mr. ROWLAND HAMILTON and by Mr. CHARLES G. LELAND of Philadelphia, and by Miss S. SOPHIA BEALE; nor was it even challenged by any of the speakers. Mr. SEDDON argued, and Mr. LELAND proved from his own experience as an art teacher in America, that the proposal was both practicable and desirable. Indeed, every one allowed that the moral and commercial advantages of being taught to draw were so obvious and great for all classes of the community, that it ought to be undertaken, and that at the public cost if necessary for those who were unable to afford it for themselves. This technical question, therefore, thus raised in this department, may therefore fairly be considered as proven, since no attempt was made to disprove it. But as regards the method of carrying out the object, Mr. SEDDON declared that it must be, to become practically useful, on very different lines to those adopted in the Government Schools of Design at South Kensington, and those now in relation therewith. He vigorously denounced that character of elementary instruction which has been misnamed, as he averred, "*freehand* drawing," and which is derived from the copying of drawings instead of drawing from objects directly. The system, it is true, is already falling into some disrepute, and consequently pupils in the present schools of design are allowed to escape from it earlier than used to be the case; but if drawing should become part of national education it would be mainly in consequence of its advantages in regard to technical improvements, and must then be of a right kind, and not such as would give a wrong bias to subsequent studies. This, he contended, that free-hand drawing had already done, to the greater prejudice of all art in this and other occidental countries as compared with oriental ones; and he instanced as evidence the fine clear line drawing of the Japanese as compared with "Impressionist" brush smudges, which did duty for all but the highest art of Europe. The several writers concurred that correct observation by the eye, with careful delineation by the hand, should be the aim of the elementary instruction to be given. Mr. LELAND described at length the efforts he had used to teach design to children of both sexes in America, with the special view of encouraging young originality, and obtaining a prac-

tical and even remunerative use for the productions of his pupils, and certainly gave some startling facts as to the results. We cannot, however, but own that we should be anxious to see the quality of the designs spoken of. These generally Mr. LELAND described as being founded on the vine, which Mr. HOPE contended should be called in English the grape-vine. We do not doubt that such results are useful educationally and otherwise, and translated into wood, metal, and other materials by the pupils commercially valuable to a certain extent, but it is questionable whether a design so manufactured can be of a very high class.

Mr. TAYLOR, the able headmaster of the Birmingham art schools of design, while allowing much truth in what had been said as to "freehand" studies, gave an interesting description of the nature of the drawing taught under his direction, whence it would appear that he has come practically to much the same conclusion, and had modified his practice accordingly upon his own responsibility and with marked success. This experience, however, does not in any way dispose of the necessity for some recognised modification of the present system in vogue, particularly if it should be made the basis for any such extended elementary instruction in drawing as was contemplated by this special question in the Art Department of the Science Congress.

Mr. HAMILTON's paper approached the same subject from other points of view, and he also urged a trial of the experiment of making drawing a universal acquisition, as did that of Miss BEALE, who gave some amusing criticism of former methods of art instruction in ladies' private schools, and even now given generally to amateurs.

On the following day, the 19th, the department was occupied with questions relating to music, when admirable papers were read by Lady MACFARREN and Mr. W. DE MANBY SERGISON, which attracted a considerable audience. These were followed by one of a really notable character by Mr. P. H. RATHBONE, the energetic honorary secretary of this department. The subject treated of was "The Place of Art in the Political Economy of a Nation."

In view of the ever-increasing competition England has to meet from foreign countries where living and wages are less, he maintained that we should have to relinquish many of the commoner manufactures, and must learn to supply their place by others in which art and intelligence had more scope—that, in fact, we must learn rather to do good and beautiful than simply cheap work, and he considered that a remedy for over-production, from which we certainly suffer, would be found in the employment of some of our population in the production of luxuries for the rest. If a taste could be widely aroused for objects for the decoration of the homes of the multitude, he considered that a demand for artistic work would be created, the supply for which would ultimately overflow the limits of the country itself, and thus give rise to an export trade of great importance in various points of view. It is to be regretted that the reading of this paper was so late in the day that no discussion was then possible. The view taken by the writer is one which Lord BEACONSFIELD is known to have taken, and such as, under present circumstances, is well worthy of careful consideration. To carry it into effect would necessitate the training of the masses in the manner suggested by the authors of the several papers above referred to.

The President, Mr. HOPE, opened the proceedings in his department on Saturday by a remarkable and interesting address upon "Art," and which was highly appreciated by a larger assembly than ordinary.

He defined art in the words of the Book of Wisdom as "an understanding spirit, holy, one only, manifold, subtle, clear, undefiled, plain, not subject to hurt, loving the thing that is good, quick, which cannot be letted, ready to do good." Such being its noble character, really fine art, he maintained, could never be immoral. Selfishness constituted the weakness of art, and hence only it became sensual; but in proportion to its forgetfulness of self, and as it became the helpmate and herald of morality, it is divinely strong.

In illustration of the above, he drew a contrast between the work of RUBENS and FRA ANGELICO. The first, able artist though he was, betrayed weakness in endeavouring too generally to show what he could do, instead of what he ought to do; whereas the strength of the latter lay in his absolute conviction and devotion to his ideal of religious art, and entire negation of all thought of himself. In architecture Mr. HOPE drew a somewhat similar contrast between the spirit of Classic and Gothic,

the position of the latter being, as he maintained, far stronger than that of the former, by virtue of its construction. Grecian architecture, perfect in its time, was limited in its power, and impossible now from its ignorance of the feature of the arch, which has become an essential. Roman architecture was but a compromise, as it used the arch in form, but had not incorporated its spirit. Really strong architecture sprung from consideration of the plan first, and this it clothed afterwards with beauty. Symmetry in Classic was a tyrant, but in Gothic a servant. The style in present vogue called, not altogether correctly, by the name of Queen Anne, was Gothic in all its strong and good points, and Classic in its weaker and worse ones. Morality of construction and morality of composition were the essence of architecture as distinguished from building, and if engineers were to usurp one important branch of the work of architects, it was incumbent on them likewise to combine beauty with utility in their work.

Subsequently, on the same day, Mr. T. C. HORSFALL read a reply to the question propounded, as to whether local governing bodies were justified in expending large sums of public money for the purpose of beautifying towns, and of providing parks, playgrounds, and other facilities for public recreation, and if so, as to what should be the lines on which they can most advantageously work. This paper was followed by a cognate one by Mr. R. HUNTER, entitled "Suggestions for the better Preservation of Open Spaces."

As to this subject, although difference of opinion was expressed as to the wisest method of raising the requisite funds for the purpose, all writers and speakers were agreed as to the absolute necessity for such provision, and the consequent obligation of municipal bodies to give ample opportunities for recreation for the people, and that they should look far ahead, as is done in America, so as to secure ground for the purpose, while it can be obtained in suburbs at a moderate price, and that all existing appliances of the kind should be utilised to the utmost, as for instance by throwing open School Board playgrounds on holidays and in evenings.

There was a very large attendance on the 22nd in the department of art when Mr. NEALE SOLLY took the chair, and Mr. WALTER BESANT, the popular novelist, read a paper to show "How best a love and appreciation of Art could be developed among the People." His experience in the East-End of London had led him to consider that the Bethnal Green Museum, taken as a type of its class, had signally failed to produce its desired effects upon the people in its neighbourhood, mainly because the objects in it were not of a character suited to their comprehension and tastes, and because no attempt was made to describe or popularise them. In these days of volunteer effort, he felt sure that there were many able and willing to preach art to the people by pointing out to them what they should admire, and he advocated the establishment of a society for the purpose. The Rev. W. TUCKWELL followed with a very racy paper, in which he amusingly characterised the substitutes for art which did duty for the decoration of the homes of the poor, and he urged that the attempt should be made to elevate the masses and teach them better taste from a Christian rather than from a merely philosophic point of view; and he showed by examples at how very moderate a cost far better and more beautiful objects could be supplied to them than those to which they had become accustomed. In the discussion that followed, the comparative failure, if failure there be, at Bethnal Green, was accounted for by the fact that the museum was not opened on the only day that working-people could make use of it.

This view of the subject was further entertained in a voluntary paper which followed, and led to the most lively discussion of the session. It was entitled "A Day of Leisure Art's Opportunity," and read by Mr. THOMAS E. POWELL, London Trades' Delegate, &c. It put very fairly the arguments on the side of the opening of the museums on the Sunday; and Mr. MARK H. JUDGE afterwards moved a resolution to ask for information to be obtained with the same object in view. An amendment in opposition to this was proposed and vigorously supported by Mr. CHARLES HILL, Secretary of the Lord's Day Rest Association, and seconded by Canon BOWLBY.

After a very animated discussion, controlled with admirable tact by Mr. P. RATHBONE, who occupied the chair, a decided victory was gained by the advocates of the opening of the museums on Sunday, as the resolution of Mr. JUDGE was carried by a majority of 86 to 4.

The proceedings of the Art Department were brought to a very brilliant conclusion on Tuesday, the 23rd, by a voluntary paper on "The Drama," by Mrs. KENDAL. The President of the Congress, Mr. SHAW-LEFEVRE, occupied the chair, and the place of meeting was filled to overflowing. The paper—read, as might have been expected, with more than usual charm and force—was a capital and well-written one, and dealt with the improvements and the reverse which characterise the drama of the present day. The subject being other than appertains specially to our journal, we need not describe it, or the discussion that followed, further than by saying that the former was candid as well as apologetic, and did honour to the fair and talented authoress, who had taken the opportunity of bringing forward several matters affecting the condition of her profession and its relation to the public in the best possible spirit.

Thus happily concluded what we are glad to be able to say has proved a very successful session of that branch of the Social Science Congress in Birmingham which naturally has the greatest interest to the readers of this journal.

## HOLIDAY PAPERS.—LIMBURG AND THE LAHN.

THE Lahn must rank second only to the Mosel among the beautiful tributary rivers of the Rhine. Like the larger stream, its devious wanderings break up into picturesque masses, wooded hills, and craggy cliffs of considerable height along its course; little towns with dominating castle or ancient church are quaintly set here and there on the banks; and half-way between source and outfall one of the finest Romanesque cathedrals in all Germany, the Limburg Dom, rises proudly on a precipitous rock, and sends the reflection of its many towers into the brimming river.

The *Brunnen* of Ems, a short way from the mouth of the river, can attract yearly a crowd of visitors, who indulge in the busy idleness of a fashionable resort, and carry the dress, the gossip, and the luxury of town life into this pretty colony of *pensions* and lodging-houses, languidly broiling on either side of the Lahn beneath the steep foliage-embowered cliffs. More enterprising and less conventional folk advance another stage up, and make Nassau their resting-place for enjoyable invalidism and easy excursions. Here the charges are moderate and the life *sans gêne*. The village would be more picturesque if the houses were not whitewashed and slate-roofed; but the situation beside the river, between two wooded hills, is charming. The capricious windings of the Lahn cut up the ground in varied lines, isolating some of the hills into pictorial prominence.

On one of the steepest the ruined tower, some shells of hollow masonry, and an entrance-gate of the old castle of Nassau, rise above the muffling beech-woods. At the slope of the hill over against the pretty village of Scheuren and its running stream are remnants of wall and corner towers, and in Nassau like fragments attest that both town and castle-domain were once enclosed and fortified. Beyond Nassau the average tourist does not trouble to penetrate up the stream, the railway as a cross-line not being of much use in the ordinary routes. Yet for its emphatically picturesque scenery the Lahnthal is well worth visiting, and offers capital ground for such a short holiday ramble as must often be all that busy men can snatch from professional work. We should recommend taking the stream downwards from Giessen, itself a dull university town, but a convenient halt from Cologne, and within easy reach of Cassel, Marburg, and other interesting places.

Wetzlar will be the first point on the Lahn at which note and sketch-books must be unpacked. The townlet once was important enough to be scrambled for in the many internecine wars and foreign invasions of Germany; it was the seat of the Imperial Diet in the seventeenth century; it had lofty walls and towers, and five city gates. But of all this there now remain only a few fragments of masonry and part of one gateway. The town lies in the hollow and on the slopes of a hill above the river, and has a *Vorstadt* for the people engaged in local industries, chemical and ironworks, on the low ground. A fine old stone bridge, survival of the fourteenth century, unites the two portions of the town; above, on an elevated plateau, stands the curious old red stone church, half in ruin as it has stood for centuries, and on the other side of the town a lofty tower, known as the Kals or Karls-munt, is a picturesque object

on the summit of a conical wooded hill. GOETHE has immortalised Wetzlar and the pretty villages in the neighbourhood in the pages of his "Werther"; LOTTCHEN's house and room are shown to tourists, and a Russian general during the NAPOLEON wars carried off as a treasure to St. Petersburg an urn, which an enterprising innkeeper had set up at Garbenheim to the memory of the original WERTHER, and had found it answer to pass off as the gravestone of the love-distraught suicide. The place is very pretty, although few architectural features are left, and from the river, full of green islets and dropping reflections of the bridge, the hills and the cathedral make a good subject for the sketch-book.

The chief interest, however, centres in the church, which has been called "a chapter in stone on the growth of German architecture." The foundation dates from the ninth century, but the oldest erection of which tangible evidence remains cannot be earlier than the twelfth. The kernel of the edifice is Romanesque; the apse and part of the choir show the round arches and proper mouldings and arcading of the Transition, but the earliest piece with which the curious porphyry font may be contemporaneous, is evidently the fine old entrance door at the west end, inside the uncompleted western façade, and towers of a later period. This portal, in a grey stone weathered with orange stains, has a composition of coupled round arches, with rich square abacus to the round columns and side shafts, sculptured with honeycomb and birds. The moulding of the enclosing arch is a massive sort of billet, and massive cushions head the roughly-moulded shafts. At the side of this entrance is heaped up, like a fallen avalanche, a huge mass of masonry in black basalt, all that remains of the *Heidenthurm*, which the builders of the fourteenth century tried in vain entirely to demolish when they began the new Gothic work. Nothing could be more picturesque than the aspect of this curious old doorway and the molten-looking mass of ruin beside it, all played into by ruddy reflections and dancing lights from the unfinished sandstone western end open to the sky. The Gothic work extends over a considerable period, but the greater part is fourteenth and fifteenth-century work, with delicate and rich mouldings, and abundance of figure sculpture—all in red stone. Attempts at various times have been made to finish the church, but the beautiful tower at the south-west angle, with its richly-adorned portal, has never reached its final stage, and is capped by a hideous erection of the seventeenth century, used as a house for the guardian; the whole of this western façade is incomplete, and fast breaking away. The tower over the north transept is partially destroyed, and throughout the exterior the patchings are many and various. Within, colour-wash and alterations have disguised a fine interior. The massive nave pillars are left, but the effect of the octagonal apse is shut off by a solid stone organ-screen that serves to divide the portions of the church set apart for the Catholic and the Lutheran worship. Wetzlar early gave partial adherence to the doctrines of the Reformation; and the conflicting interests of the religious bodies who both lay claim to the parish church, the strife of political parties, the ravages of war, and the fallen prosperity of the place, have hindered any solid effort to restore or complete the *Dom*. The industries of Wetzlar are said to be now rising in value, and the fear is that utilitarian enthusiasm will eventually lay hands on the edifice, and spoil a condition of things which is intensely interesting and seemingly picturesque. Completion would certainly imply destruction in this case, especially at the western end. One is half-disposed, therefore, to hope that they may let the *Dom* at Wetzlar be.

The hills which on the north-east of Wetzlar retreat from the river, leaving a tract of arable and corn land, wooded knolls, and patches spotted by villages and farms, and overlooked from behind the lower ranges by the conical purple peak of the Gleiberg, close in as you go down stream. The river plays hide and seek in its capricious doubling and winding about the rich woods of beech and fringing acacias. At Weilheim the pretty château rises from the waves of foliage; then to beech succeeds oak, and to sandstone succeeds limestone. At Villmar the marble quarries sparkle in the sun, and presently we stop at Runkel, for here there is good sketching ground. The village lies on both banks, but chiefly on the west, where the houses are set at all sorts of angles on the lower ledges of the steep crag, weather stained almost black in exposed surfaces, on which is built the old castle of the Princes, a massive pile, partly habitable, partly in ruins, having two tall square towers and one hexagon, and fine solid flanks of masonry

to the cliff. The river makes a sharp bend round the crag, has a fall and a backwater, and is crossed by a splendid old bridge with five arches and noble round buttresses. The *ensemble* from the opposite bank or half-way up the rocky cliff facing the castle is most striking, and, according to the simple hostess of the rough little inn by the bridge, attracts many artists. We saw none, however, nor any sign of tourists. The accommodation is of the roughest here, a contrast to Wetzlar by the way, where in the once handsome dwelling-house on the Buttermarkt, now an hotel with the name of the Herzogliches Haus, we had slept in the former ball-room with five windows, amid the mirrors and gilt consoles of former splendour, and dined under the auspices of a first-rate *cuisine*, though the establishment boasted but one waiter. Besides the larger views there is detail to profitably detain the artist in Runkel about the houses and castle; the village up on the hill has pretty woodwork in window and timbers, and a pile of conventual building stands picturesquely on the edge of the cliff. Between Runkel and Limburg rises on a crag, sheer above the Lahn, the ancient mother church of Dietkirchen, whose severe, simple Romanesque forms, lofty western towers and impressive position, give the model for the great pile at Limburg, built also on an isolated rock above the river. Beyond Limburg, a few notes on which shall complete our sketch, is some of the most striking scenery on the Lahn; for example, Dietz, a quaintly-built little town, closely packed into a hollow, with the old feudal castle on a rock in the very heart of it; its square, central tower, with corner turrets and grim flanks of wall, showing warm orange, lights and grey shadows on the yellow stone of which it is built. Further on the hills are split up into ravines, and on a crag in one deep cleft stands the famous Arnstein, a picturesquely impressive example of the many towered and fortified residences of the Middle Ages hereabouts.

(To be continued.)

## THE STRENGTH AND THE WEAKNESS OF ART.\*

BY THE RIGHT HON. A. J. B. BERESFORD-HOPE, M.P.

IT will not, I think, be inappropriate to commence the artistic discussions of this Congress with an inquiry, as brief as the subject can admit of, into the strength and the weakness of art.

But first of all I am bound to answer the underlying question:—What is that so-called art for which I predicate the possibility of such opposite qualities? In working out the definition I shall, I believe, make good way towards dissipating the difficulties which it is my object to bring before you and to clear up.

Counsel has on this head been much darkened by a frequent confusion which has existed between art on the one hand, and on the other the objects and methods of art. Objects of art are manifold—such as pictures, sculptures, buildings, furniture and other component parts of buildings, wall decorations, and so forth. Such, too, is the case with the methods by which art makes itself palpable. Art itself, on the other hand, is the one informing, harmonising, life-giving spirit, which runs through all the visible creation, binding all together, and presenting the result to the view of intelligent minds in shapes which are, both as a whole and in parts, useful and appropriate for the object of their existence, and lovely to the eye of the beholder; the usefulness and the loveliness being consistent with and supporting each other.

But why do I attempt to define art in my poor language, when I can refer to a definition, in the first place, indeed, offered as of wisdom generally, but which can rightly be for my present object limited to that branch of wisdom which is called art? It exists in a book from which no man who seeks it for teaching goes away empty. I mean the treatise which is truly styled "Of Wisdom."

In this we learn that wisdom, for which I substitute art, is "an understanding spirit—holy, one only, manifold, subtle, lively, clear, undefiled, plain, not subject to hurt, loving the thing that is good, quick, which cannot be letted, ready to do good." Art also is "the breath of the power of God, and a pure influence flowing from the power of the Almighty; therefore can no defiled thing fall into her;" for finally, "God loveth none but him that dwelleth with wisdom," of which wisdom, art, I assert, is the visible sign. In all this I beg you to notice, for it is the foundation of my position, that the art which is thus presented to us all-pervading and universally powerful is yet, as the very definition notes, not some-

\* An address delivered at the Social Science Congress, Birmingham, on Saturday last.

thing which exists in selfish isolation, as it were, for its own glory and benefit, and without regard to the conditions of the world which it has been sent into to assist and benefit.

You will, I hope, have taken notice of one definition in my quotation from the Book of Wisdom. Wisdom, or (under my limitation) art, is described in our English version as an "influence." It is an "influence" in its action upon all which comes under that influence. But once it has been brought into an active condition of influencing, it may be regarded in another light, and another descriptive epithet may be employed. Being an "influence," it is also an "attribute."

I have hitherto been trying to define art, with the help of the English version of the Book of Wisdom, but I must note that the original Greek, which is with us freely rendered "influence," is *ἀπόρροια*, or a "flowing from" more literally. This gives us further idea of an emanation from some higher power, *emanatio*, in the Vulgate version. It is emanation in reference to the originating power, and influence in reference to all upon which it flows.

I have now reached the point to which I want to lead you. I despair within my short limits of being able to present a rigorous proof of my position. But I hope to give you a few examples tending to show that when the artist, forgetting himself, but respecting his art as a healthy attribute, uses it as an emanation from on high, and an influence of truth, then it is strong. When he worships himself, and deals with his art as if it were the end as well as the means, then that art must be weak.

Accept art as an influence, and you must confess that it will be the minister of good or of evil in proportion as it affects wholesomely or balefully the substance to which it finds itself attributed, in proportion, in other words, as it is true art or false art. Very clearly then it must be accepted as an especial engine of God's moral government of the world, and in proportion as it is the help-mate and the herald of morality it is strong in a divine strength, and in proportion as it forgets its work of influencing, and, instead, affects to domineer and to substitute itself for morality, it becomes weak, unstable, and treacherous.

This is a position on which I very emphatically insist. It is important at all times, and it never was more so than in the present day, when æsthetic perceptions—for the old word "artistic" is quite out of fashion—would, if we would believe the depth or precision of thought of excited and gushing votaries, seem ready to pose as the substitute of old-fashioned morality and generally accepted common sense. As you love art, and if you love art, resist this. True art never can be immoral, for it remembers of what it is the influence. False art, that is, art which thinks of itself and not its mission, has only self to rely on, and self's perceptions; and in its weakness it must become sensual.

I have, as you will remember, interposed a caution against art and the methods of art being confounded. I advance no claim to be a critic of pictorial art, for my art studies have mostly been in another direction. But it is a great happiness of my life to be an admirer of pictorial art, and while, as I am very conscious, unable scientifically to describe methods, I feel their power and bow before them. The pleasure I believe to be genuine and wholesome in cases as to which I should not be able to answer the charge that it was a pleasure arising not from the art we recognised, but from the more visible excellence of method, or from an admiration—to put the matter as shortly and as clearly as I can—for the composition, the colouring, and the expression of a picture, in which, however, the stern sense of what art—taken at the highest—meant, would compel us to acknowledge that something was wanting to complete the noblest attributes. It is, in fact, because I desire to protect and to place at its sufficient, though not extravagant, level that appreciation of the methods which it is necessary to preserve towards the general well-being of civilisation as the appreciation of excellence in any other pursuit, and at the same time to vindicate the moral strength of abstract art as a thing apart, that I have dared to embark upon the present discussion.

I am conscious that, in drawing this distinction, I may lay myself open to be asked how I can really define between the higher abstract art and its visible processes and manifestation. To confess that I am conscious of the difficulty will, I hope, be taken to show that I have some tangible idea present to my mind for which I desire to find expression, and that I may not be reminded of that difficulty which the wit of the eighteenth century conjured up as to conceiving a lord mayor without a lord mayor's accessories.

As illustrations of my meaning, I will bring before you two painters, one of them confessedly great in all the attributes of art except, I venture to contend, the very highest, and, through his defects in that respect, liable to be summoned, as I do, to appear as an example of weakness; and the other one, whose perfections, unique as they are, have no vestige about them of the heroic, but, just because they are not heroic, are so absolutely self-forgetful in their enthusiastic devotion to all which is right and pure, as to win for their creator the claim of being cited as showing forth the strength of art.

*Peter Paul Rubens.*

Rubens, handsome, well-born, endowed with a quick intellect and unflagging spirits, accomplished, winning and popular, the favourite of kings, the darling of his countrymen, the worship of a

brilliant host of pupils, as capable as they were devoted, was, if ever there had been one, a spoiled child of fortune. His prosperity was well deserved, his spoiling was but too natural, and it is that which justifies me in producing him as an example of one whose weakness came of misdirected efforts after strength.

All which we read seems to show that Rubens' own disposition was a noble one, and we find in his religious pictures no absence of that quality of reverence which is far too often wanting in the artistic temperament, while the deficiency spoils works of art which might otherwise have been masterpieces. But because Rubens was reverent, was he therefore religious? These two qualities are not quite identical, for reverence is more an intellectual attribute, and needs only imply, in the painter, the appreciation of the serious treatment which the subject demands. The religious nature draws its inspirations from the heart as well as the head, and secures the success of the treatment by a true appreciation of means. There is something more positive about religion than about reverence, and it was just this positive quality, involving the abnegation of self, that Rubens never quite succeeded in reaching. It was always the scene, visibly and intentionally presented with pomp of colour, force of action, realisation of humanity in its material greatness by the artist whose creative faculty we are not allowed to forget for a moment.

In thus urging the simplicity of true self-forgetfulness, Rubens only did not rise superior to his age and to the strange confusion of divine and human things which marked the Renaissance. How strange, for instance, according to our notions, is the habit of heaping pictures with gorgeous but incongruous accessories, in the use or the abuse of which Italy knew no moderation! No doubt, too, we have all of us consciously condoned the splendid anachronisms of the southern pencil. In fact, we have laboriously taught ourselves that there is no incongruity about it. For instance, Paul Veronese's *Marriage at Cana*, on which we all gaze with such delight, is a feast in the palace of a Venetian nobleman, impossible in its magnificence even for a Venetian nobleman. It is, in fact, hardly incongruous, because it is so very incongruous. It would be crass and dull to ask, But were things done that way at Cana? But Rubens, unquestioned despot in another country, had it in his own power to make or break traditions, and he deliberately came to terms with the anomalies of the Renaissance.

But here I might explain that I hold no brief for that realism which believes that a scene which appeals to the sentiment of all ages and all lands is to be appreciated according to its conformity to the requirements of chronology and geography. This pedantic accuracy may result in mistaking the means for the end, and sins accordingly against our fundamental definition of art. Chronology and geography are excellent things, but piety and imagination are better. The influence which we are bidden to look for works through emanations from them as it does not through chronology and geography. Just as you would, I am sure, be willing to exchange any number of Macbeths as we now see them, in all the precision of barbaric archæology, for John Kemble as he stepped on with his nodding ostrich plumes, so you would be very sorry to see the desire for accuracy, laudable as it is, whenever it is attainable, degenerate into the pedantry of an ultra-realistic clique.

It is not the Venetian dresses or the palatial architecture which requires to be explained in Veronese. You might embody the whole human sentiment which is aroused by the supper at Cana, in Venetian garb, and provide an arcade by way of background. The emanation would be equally pure and fresh. The weakness of the picture is that in the pomp of the accessories the interest in that divine event has been allowed to evaporate. The dresses at the Ammergau Passion Play were conventional, and appreciably founded on types picked up in Renaissance art, but the intense reality of the acting blotted out all anachronisms, and we were more actually in the Palestine of eighteen hundred years ago, than if a congress of sceptical archæologists had sat upon every group. We have hitherto been dealing with Rubens as a religious painter. But his weakness in showing what he can in preference to what he ought to do was not confined to his religious pictures. He was, I suppose, at his weakest in that strange sprawling ceiling of Lord Jersey's, which was exhibited this year at the Old Masters. But it is not fair to judge him by this. Let us turn to an acknowledged masterpiece. He had to paint the triumph of a French queen, who for the purpose of art was everything which was noble, pure, and magnificent. It is no part of my task to depict the actual character of Mary de Medicis. Accordingly, the most appropriate compliment he could pay her was to show his mastery of the undraped body, by crowding her up with a bevy of handsome but most coarsely conceived naked women.

*Fra Angelico.*

Such is Rubens, great and strong as a man of genius, as an artist weak in proportion as he yielded to the weakness which is the doom of the man who places himself before his appointed work. With whom shall I match him as the exemplar of the strength which conscience and duty vigorously performed bestow? Let me take you back rather less than two hundred years from the days of Rubens. We shall then find in a convent at Florence a gentle, guileless, unworldly friar, industriously and contentedly working away at his daily toil of commemorating sacred subjects

on a scale which was mostly but little removed from miniature, in pictures full of grace, in face and in person full of gentle undulating motion and full of expression, and all presented by tints of peacock-like radiance, and enhanced by bold but yet harmonising contrasts—the very painter born to dream of paradise, who made paradise his favourite theme. What strength can you find in all this? I shall be asked. It seems very meritorious, but it does not sound very strong. So without hesitation I reply that strength of absolute conviction, that strength of a duty to be done, without stint, without delay, and without repining, that conviction that it must be done without one passing thought of self, of pelf, of renown, or of worldly advantage, all centreing in a mind rarely perceptive of and able to embody pictorial beauty, have in the world of art won for the blessed brother John of Fiesole his unique place among the world's greatest painters.

But do not mistake me. I should be sorry if you supposed me arguing that Fra Angelico, because strong as I define strength, was therefore altogether strong. On the contrary, in various important functions of art he was unmistakably weak. He was weak when dealing with the violent and vicious passions. His devils are grotesque and often almost comic. But these shortcomings serve to illustrate the position that strength in art is unselfishness, forgetting self and self-glorification in the direct and unadulterated purpose of the art itself. In paradise Fra Angelico did so—when in a different place he forgot the condemnation upon him that sets his hand to the plough and looks back. Cruelty, coarseness, and lubricity were infinitely disgusting to his pure nature, and so he did not sufficiently recollect that by his profession of painter and by his choice of subject he had bound himself to defeat them by exposing them. Holding the mirror up to nature was a law which had not yet been formulated in his day. The exposure was not complete, so the defeat failed, because the painter was forgotten in the friar.

There is a legend touching Fra Angelico's practice, which it is difficult to believe in its literal extent, but which has probably a substratum of truth, namely, that working in the pious enthusiasm of his mission, he refused ever to paint over again what he had once done, or to correct a stroke. Such gentle confidence is against accepted canons of art, and the moral which I should draw from the story is, that the painter who could be believed to work upon such a method, and yet secure the fame which is his pious inheritance, must indeed have been strong.

Let me by the way call on you to remember how much the world had learned between Fra Angelico's time and Rubens' days, in technical processes, in the laws of perspective, and so forth. It is not a little because of such inevitable disadvantages, mastered as they are by his genius, that I proposed Fra Angelico as an example of strength. So it is also with regard to his magnificent capacity, helped by his superior advantages, which induced me to point to Rubens as one whose great powers, nobly as they were exercised, yet fell short of that excellence which he might have reached if he had not, in always measuring his strength by its personal relations to his own glory, failed in the strength which comes from the emanation from on high, and is the healthful influence guiding the noblest minds.

I trust that it will not be imputed to me that I desire to depreciate the glorious power of Rubens, or to insinuate that all outside the paradisiacal groups of Fra Angelico is unholy ground. Such an imputation would directly falsify my conviction, and obscure the great truth on which I insist, that the greatest genius is fallible and the widest range circumscribed by limits as invincible as they are invisible. If we could conceive the painter who would combine the excellence of Rubens and of Fra Angelico, then that Phoenix of the Ages might be taken to represent all the strength of art, and as little of its weakness as this probationary condition admits of. But if it be objected that the man has already lived and that his name is Raphael, I shall not busy myself to contradict or to confirm the assertion, but, varying the phrase, invite you to face the possibility of the artist arising whose great reconciling touch shall combine the force of Rubens, the sweet purity of Fra Angelico, and the faultless proportion of Raphael.

#### Architecture.

Now, then, let me call you away to consider the strength and the weakness of art under other conditions, and in a different field. We have been testing it as it has shown itself in painting; let us now follow it up in architecture.

I have, as you will have seen, placed the question of weakness and strength in reference to painting upon the conformity or divergence of the artistic product from an ideal, the closest representative of which, allowing for the poverty of language in lending itself to abstract thoughts, would be morality. As no painting has a material or constructive duty to fulfil, this morality has nothing to do with material considerations. With a building, which has its mechanical end, and regarding the product of architecture as both an art and a craft, the material morality of construction and materials comes in no less than the immaterial morality of composition, and, to make a short story of it, the test of strength in architecture as an art is the success and completeness with which these two moralities are combined—the morality that is of construction, and the morality of composition. To this may, after all, be

reduced that conflict of wonderful persistence, wonderful acrimony, and wonderful interest to those engaged or interested in it—the battle of the styles, or, in fuller terms, the comparative merits of the styles which we may loosely tie up together as Classical and those which we may as loosely tie up as Gothic. In this division of opinions I have long consistently and strongly taken my side with the advocates of Gothic. But I have striven to do so in the spirit of a partisan by conviction and reason, and not of one who was intervening in a faction fight. It is not, of course, my part to find fault with the grand energy of men on whose side I am myself contending, and I have not the least doubt that if Pugin, or Mr. Ruskin, had been more cold-blooded he would have influenced less and done less. For my own part, however, I am anxious to proclaim how much I find to admire in the style which I do not prefer, as I hope I have shown how much I admire Rubens, who, I might add, had I time to follow the analogy, seems to show striking affinities with the spirit of Classical architecture. I shall go at once to the root of the matter, and endeavour to show how much stronger is the position of Gothic than of Classical if the practical test of construction be applied. In fact, I dare assert that with our active civilisation the Classical method at once finds itself put upon the defensive. There is another train of thought, partaking of association and sentiment, which is often and strongly urged on behalf of Gothic as the Christian style and as the national style. Conscious as I am of the strength of this argument, I am willing on the present occasion to forego it, and trust to more purely architectonic, and therefore artistic considerations; I shall tie up that hand, and with the other make a good one-handed fight for the style of my predilection.

Classical art in its most consummate beauty is found at a very early date in its history—namely, in the art of Free Greece. This is a truth which is so little contested as to have become a truism. But what is that architecture of Free Greece which is the *ne plus ultra* of Classical art? It is the art of the beam and the post, the art to which the arch is an absolute stranger. It is trabeation, not arcuation. The Romans, heirs of the Classical art of Greece, found out the arch, a practical gain which would be feebly described as invaluable, and through the long centuries of their domination they laboured to marry the arch to the ornamentation which they had received from trabeated art. It was a gallant attempt, marked by conspicuous ability, and developing much material force—material in excess of artistic force. It was working as Romans for a Roman object. But the verdict of cultured posterity is that for pure beauty the architecture of Greece, with the drawback of ignorance of the arch, is superior to the more grand efforts of arcuated Rome. In this fight of centuries the arch at last prevailed, and declared its right to dominate the composition—the round arch in Romanesque, the pointed arch in Gothic. It was a strangely-prolonged contest, but not devoid of prophetic forecasts, which men were, of course, unable then to decipher, and over which even with the light of retrospection flashed upon them they are very dim of sight.

It is a commonplace of rhetoricians, when they desire to point a sentence about Roman grandeur, to appeal to the aqueducts; but these aqueducts—long lines of arches—are just the buildings in which all classical elements and classical feeling are reduced to a minimum, and the victorious arch asserts itself as the guiding principle and the leading form. Look also at the Coliseum. The details of the pilasters, no doubt, are Classical; but the grand idea is one of which the cardinal feeling is the play with free arch. Those Classical details may forbid us from calling the Coliseum Romanesque. But if Greek architecture is Classical in its purest and truest form, what is the architecture of the Coliseum? The critic who can complacently point with one hand to the Parthenon and to the Coliseum with the other, and exclaim that he takes his stand upon Classical because it produced the Parthenon and the Coliseum, is a juggler who throws dust in our eyes by substituting words for ideas. The art principles of the two buildings are not different. They are hostile. The plausible objection of a few years back, that if things were really so the world never would have seen the resuscitation of Classical, may now well be left to the rejoinder that in that case the present age would never have been concerned with a Gothic revival.

Grecian architecture, with all its beauty of form within its limited sphere, is impossible now because, with all its refinement, it is barbarous in construction from the ignorance of the arch; while Roman architecture is not the architecture of Greece developed and made possible by the introduction of the arch, but the long conflict—a conflict of giants who needed centuries to adjust the fortunes of their fight—between the legacy of Greece and the inconsistent, invading, and ultimately victorious arch.

But this is not the only reason why the present practice of Classical architecture spells weakness. The architecture which is really strong creates the plan first, for the building is for man, and not man for the building, and then it clothes upon that building with all needful forms of beauty, generally the more beautiful because dictated by practical convenience. Such, speaking generally, is the Gothic method. With the Classical architect all must bow to pedantic laws of symmetry, and the most able building is not the one in which a varied and picturesque outside is the visible sign of a carefully-planned and convenient inside, but one

in which the conjuror has most craftily masked inconvenient wants by ostensible shams. That noble pile St. Paul's Cathedral is, I am sorry to say, a signal instance of this artistic weakness, for the whole of that attic storey which composes the upper half of the external elevation is a blank wall, screening a construction directly borrowed from Gothic cathedrals, in which it would have been made a delight to the eye by aerial flying buttresses and graceful clerestory. Do not smaller buildings also teem with blank windows, inserted to match the real lights, and with windows cut athwart by floors, where the working storeys and the storeys of pretence refuse to correspond? Time would fail me to catalogue all the clumsy contrivances which are necessities in Classical composition, and which, except by extreme blundering, can never occur in Gothic. Yet Gothic, when the need requires, or when no counter need forbids, can be as rigidly symmetrical as the rival style. The difference is that Gothic is the master, and Classical the slave of symmetry. Now I may have to prove that the strength of art in its architectural aspect is to be found in that arcuated method of which Gothic is the most perfect expression, and its weakness in that Classical which is either trabeated, and therefore wholly inadequate for an actual civilisation, or else striving to be arcuated, and therefore in rebellion against its trabeated first principles. The wide question of the comparison between details refuses to be dismissed in a few sentences, so I leave it altogether untouched.

The test of strength or of weakness is not a bad proof to which we may put the merits of that style which has sprung into so much fashionable favour under the name, alike abhorrent to geography and to chronology, of Queen Anne, but which we may very fairly consider as a development of the Dutch Renaissance. If I were to regard the phenomenon with the eyes of a Gothic partisan my feelings would be those of unmeasured exultation, for the enthronement of so-called Queen Anne is the absolute surrender of the Classical school with all its dogmas. But is it the advent of a variation of Gothic which has reached us clothed in all the strength of its style, or has it during the process of change needful to legitimate its *alias* taken to itself elements of weakness which may help to point an example?

The Queen Anne style, falsely so-called, lays claim to sharing in the strength of Gothic, by its honest display of the main features of the building, such as the visible gables against which the roof-tree abuts, the doors and the windows where they are wanted, and not where self-impressed symmetry compels. The red brick which it habitually employs is practical and rich in colour; but it exchanges strength for weakness in the details which have sprung into being through an unnecessary longing after contorted forms, such as extravagant gables and strange varieties of windows and window-settings.

The strength you will see is intrinsically greater than the weakness, for one deals with the structure and the other with the accessories; but the weakness is obtrusive, and therefore tells far more to the disadvantage of the structure than its constructive value can succeed in counteracting. Yet a Queen Anne building stripped becomes a Gothic skeleton, while a modern Classical building stripped is left in the shameful nudity of having no right to claim participation in any style whatever.

There is a palpable reason, on which I shall insist very bluntly, for the architects of our generation being even more careful than their predecessors in insisting upon a rigid observance of the double moralities of architectural art, the morality of construction, and the morality of composition. The civil engineers, a noble profession within its own limits, have come into the field as fierce competitors. The relations of architect and of engineer is a wide and difficult question, and one which it is absolutely impossible for me to touch in the few minutes still at my disposal. But I must say that if our architects desire to hold their righteous own against the competition of the engineers, they must buckle to with all their might to master every detail of construction, even in portions of the building which never can be exposed to view, to master thoroughly the value as to strength and durability of all materials, to be familiar with all the laws of thrust and resistance, and to wield with an unerring judgment all the principles of sanitary science. The engineers, on the other hand, if they go afield where architects used to be credited with an honourable monopoly, must condescend to those principles of composition, of dignity in masses, of grace in details, which are the features which make a building delightful to an unscientific eye. The Thames Embankment is a gigantic and magnificent work, but would it have been worse if the artist's hand had been more visible in the details, and particularly in the parapet?

Talking in this connection, I must say that in my opinion a more severe blow was dealt to the credit of Gothic architects by the discovery that, with all the pains which the chief of Gothic artists had taken to prove how gracefully he could dance in the fetters of that alien style which official prejudice had forced upon him, he has yet shown himself so strangely unappreciative of the responsibility which rests on every architect to master, and so bestow his personal care upon the sanitation of his building, than by the apparent readiness with which he ever assumed those fetters; for an ill-drained building produced by an able man must be weak, lamentably weak, in the trappings of whatever style it

may be garnished. It is in fact, as far as he can make it so, the proclamation that true art is not inseparable from true utility, that its influence may fail at the moment when life and death are at stake, in the refusal to make its presence known where it cannot court the passing applause of men, for sewers are generally unknown, and where they are known, they are in their nature noisome. Therefore, the architect who works for truth and not for applause, is bound to see that he does not purchase an outside artistic triumph, by playing with those issues of disease and death which follow on the neglect of nature's sanitary laws. Here you see is a fresh test of weakness in art.

I have, as you will observe, endeavoured to exhibit the strength and the weakness of art in strongly contrasted and very different aspects, the aspect namely of painting and that of architecture, and I have made little attempt to connect the two presentments of my subject. The mutual dependence of arts upon arts as they make up the grand singular art, would require a volume not an essay to discuss, and so I thought the immensity of the subject would be most vividly brought before your eyes by taking the connection for granted, and exhibiting isolated examples, although my treatment of the subject has led me from Fra Angelico to the drainage of the public offices. You may now, however, reasonably ask me whether I esteem it easier to make for strength, and eschew weakness in such a form of art as painting, where the difficulties are mainly moral, or in such as architecture, where they are also material. I am afraid my answer might be a rather ambiguous one, for I cannot get more near to a definite conclusion than by saying that it greatly depends on the temperament of the artist. Just as in the moral and intellectual character one man's strength is another man's weakness, so it is in the artistic life.

It is now time to draw to a close, and to thank you for your patient attention. I have been much guided in my choice of subject by reflecting that I am addressing not an art congress, but the art department of a Social Science Congress. Social science, as I read the term, is the science of social life, that science which, not in opposition to revelation, but as its handmaid and representative, labours to build up the human family in order, peace, and prosperity as an elect and noble commonwealth. So I asked myself if I could find a point of contact between social science and art, and I trust that I have found it in the strength and the weakness of art.

#### ECONOMIC DWELLINGS.

THE work of the Edinburgh Co-operative Company was described by Mr. H. G. Reid, in a paper on "Economic Dwellings for the People," which was read at the Social Science Congress. The author said that the capital of the society was at first fixed at 10,000*l.*, in 1*l.* shares, the object being to build with the view of accommodating such persons as were desirous of becoming owners of their dwellings. The entire capital was soon realised, and houses constructed in two storeys, each family having a separate entrance—a new departure in Edinburgh. A member of the society might become possessed of a substantial and commodious dwelling-house, costing from 120*l.* to 130*l.*, and worth in the open market from 160*l.* to 180*l.*, for an actual immediate outlay beyond an annual equivalent to ordinary rent of from 20*l.* to 30*l.* The society is now about to construct suburban dwellings. The net cost of these has not been ascertained, but they will be redeemable over a period of twenty-one years by monthly payments only a fraction higher than the rent generally paid for such houses. The houses built or arranged for number about 2,000, and the value of the work done, and about to be done, exceeds 400,000*l.* The capital, which was gradually increased, has yielded from 8 to 10 per cent. per annum. During the past fifteen years efforts of a like character have been made in Aberdeen, Glasgow, Dundee, and other Scotch towns; and in Liverpool, London, and some other great centres of population in England. It is not said that the experiment, admirable as it is, evolves any panacea for the permanent advancement of the British labourer. Yet it embodies a principle, the adoption of which touches, with life-giving effect, the roots of his moral being, domestic happiness, and material welfare.

#### BERLIN STREET PAVING.

A NEW form of paving has been in use in Berlin since last year, which seems to offer some advantages over wood. Layers of bricks are put down, from four to six inches in length, and impregnated with asphalt. After a short period they lose any air and water that they may contain, and absorb from 15 to 20 per cent. of the bituminous matter, becoming remarkably elastic and capable of resisting pressure and damp. The traffic in the Berlin main thoroughfares is of a heavy character, and it has been found that the new paving lasts much longer than any of the other systems, added to which it offers a sure foothold to horses. Occasionally it is found that after three months' wear some of the bricks crumble into dust; but this is believed to arise from a faulty impregnation with the asphalt, and not to any real defect in the system.

## NOTES AND COMMENTS.

THE Chinese appear to make use of metals to a larger extent than formerly. Foreign metals enjoy great popularity, as they are cheaper, better, and more easily worked. Many articles formerly made of wood are now made of iron, tin, or wire. The workmanship is often rough, and capable of great improvement; but the articles so made are found to be nearly as cheap, and much more durable, than the same in wood. Iron wire is used for frames for lanterns, stems of artificial flowers, &c., as well as for rough needles. It is found that iron bars are convenient for holding together the stones used in constructing quays and landing-places. An inferior tin, consisting of three parts tin with seven of lead, is employed for boxes and lamps. China possesses great stores of various kinds of metals awaiting development; until they are utilised the foreign import is likely to continue and to increase. It may also be stated that window-glass is no longer a rarity, and it is expected that the Chinese will before long attempt to manufacture plate-glass. They now make mirrors by silvering foreign glass and fixing the pieces in wooden frames. One shop turns out from seventy to one hundred glasses a day.

SOME notion of the quantity of Japanese fans used in Europe may be obtained from the official returns. During last year Hiôgo exported 2,647,966 fans; Osaka, 166,645 fans; and Kanagawa, 1,919,840 fans, or nearly four millions in all. There were 132,110 umbrellas and 16,299 screens exported from two of the ports, and the figures do not represent the entire quantity sent abroad. The exports of bronze, furniture, and porcelain are also remarkable. Looking at the extent of the trade, it is not surprising that a Japanese company is constructing an iron pier at Hiôgo, which is 450 feet long, at a cost of 100,000 dols., and four warehouses as bonding stores, each measuring 102 feet by 42 feet.

THE paper by Mr. F. SIEMENS, which was read at the meeting of the Iron and Steel Institute, on Wednesday, indicates a revolution in heating. It referred specially to the Regenerative Gas Furnace, but it may be applicable to other forms of furnaces. Hitherto the rule has been to make the space to be heated as small as possible, in order that the flame might be brought into contact with the inside lining of the furnace and the material to be operated upon. Mr. SIEMENS now believes that the most effectual way is only to allow the flame to radiate upon the material to be heated or melted, and to keep it from actual contact. The results obtained in practice show that there can be no doubt that almost all heating apparatus used in the arts, in which direct contact of flame with the substances treated is not necessary for chemical reasons, will be materially improved by the application to them of the principle of transmitting the heat of flame by radiation only, while the heat of the completely burnt products of combustion is better utilised by contact. Complete combustion of the fuel is insured by this method of heating, and it will therefore entirely abolish the smoke nuisance. Smoke is never formed when combustion is complete, being always caused by flame coming into contact with solid bodies, the process of combustion being thereby checked. This is, for instance, the reason why brick-kilns generally smoke so abominably, for in them scarcely developed flame is forced to impinge immediately on cold bricks, and can therefore only act in a very incomplete and uneconomical way. To work well, a brick or pottery kiln should be so built that the flame can burn itself out in a free space before being brought into contact with the bricks or pottery.

THE Commissioners of Sewers for the City have decided to make arrangements to ventilate sewers by carrying pipes above the houses. It should be known that the plan is not universally approved. In giving evidence before a Select Committee of the House of Commons, the inspector who has charge of the police arrangements asserted that since that plan of ventilation had been adopted in Westminster the atmosphere became worse. "The officers, the superintendents, the inspectors, and myself have," he said, "an opinion that the ventilation of the sewers by those pipes which run up the sides of the houses contributes very materially to the air being so impregnated with gas from the sewers." This statement was brought under the notice of Sir J. W. BAZALGETTE, the engineer of the Metropolitan Board of Works, and he agreed that in many cases the

plan is a very dangerous one, as it is much worse to have the mouth of a ventilator near bedroom windows or chimneys than to have the sewer gas diffused in the street. Sir JOSEPH has had more experience than any living engineer in examining devices for the ventilation of sewers, and the conclusion he has arrived at is that the best thing to be done is to take care that the sewers are well cleansed with a good stream of water running through them, so that all decaying matter should be carried away rapidly. There are opinions which can be taken to support the Commissioners' plan, but even the most cautious chemists must admit that sewer gas can readily enter houses under the conditions proposed.

A GREAT many letters have appeared lately in the *Times* on the subject of building societies. For a long time there has been much doubt about their true condition. It is possible to produce balance-sheets which are reassuring; but to what extent do they represent the affairs of the societies? The suggestion commonly made is to ask an independent actuary to investigate the account books. His employment would in many cases be a service, but in the most essential matter he would be useless. The difficulties of the societies mainly arise from advancing loans which are in excess of the value of the buildings which become security. The men who generally act as valuers are pushing fellows who have helped to get up the societies in order that they may be appointed surveyors. It is rare to find a valuer attached to a society who before its constitution had gained any position in that line. He is more likely to have been a furniture dealer, an auctioneer in a small way, or a collector of rents, than a surveyor. It is difficult to estimate the damage which those men have done; but the investigation, if undertaken, must be the work of an architect or a surveyor rather than of an actuary. If a few experiments were made with societies taken haphazard, we are confident that enough would be discovered to make a Royal Commission a necessity.

GENERAL PITT-RIVERS, the Inspector of Ancient Monuments, does not believe that the Pen Pits in Winklebury are the remains of "the largest ancient British city of the realm." The pits have been the subject of much controversy, but a careful examination of them appears to prove that they are only primitive quarries. The Britons, if such they were, who worked at Winklebury, being, according to General PITT-RIVERS, very imperfect quarrymen, as may be judged from their rude stone monuments, and being unable, with the tools at their disposal, to grapple with the solid rock, they skimmed along the surface of the layer of stone, removing such loose fragments as could be easily detached and which served for the formation of querns. Portions of defective querns were found mixed with the rubbish of the pits. It is also remarkable that no remains of pottery have been found in the excavations, and there is no record of any having been met with in past years. It would thus seem that we are far from having in the Pen Pits a part of a connected system of prehistoric fortification.

THE bars and gates which are allowed to exist on many of the great estates in London seem to be a relic of feudalism. It has been a cause for wonder that the Metropolitan Board of Works have not obtained powers to remove those impediments to free communication in the metropolis; but at one of the last meetings it was decided, by a majority of two, to take no steps in the matter at present. A number of delegates from vestries and district boards met at the St. Pancras Vestry Hall on Wednesday, when the following resolution was proposed:—"That this conference, having heard read the report of the Parliamentary and General Purposes Committee of the Vestry of St. Pancras and the proceedings of the Vestry thereon, hereby concur in the views expressed thereby, and do urge upon the Metropolitan Board of Works the desirability of their reconsidering their decision of July 25 last, with a view to immediate steps being taken to promote a Bill in Parliament for the abolition of bars and gates across the public thoroughfares, as a matter of metropolitan and public importance and necessity." The resolution was carried unanimously, as was also a second resolution requesting each vestry and district board of the metropolis not only again to memorialise the Metropolitan Board, but to request their representatives to support their views in bringing the matter by a Bill before Parliament.

DESIGN FOR THE ADMIRALTY AND WAR OFFICES.

WE publish three views, showing the design by Messrs. VERITY & HUNT, which was placed second in the late competition. It can be said that no design received more commendation from architects.

## POPULARISING OF ART.

THE special question considered on Monday in the Art Department of the Social Science Congress was, "How can a love and appreciation of art be best developed among the masses of the people?" The first paper was read by Mr. Walter Besant, the novelist. Premising that his remarks were based upon no other experience than that of East London, and must not be taken as applying to any other city, he said that until we had mastered the problem of finding steady work for all, with adequate wages and decent homes, we need not look for art in the lowest ranks. They had, therefore, to do not with the very poor, but with the respectable poor, who had leisure and possessed some education, and in respect of whom there was no reason at all why they should not, if they could only be got to desire it, become students in some of the branches of art. With respect to the agencies which were at work for art in the East End, there was first the Bethnal Green Museum, which, intended to be a great educational centre, had done nothing of the things for which it was founded. It was simply a dull and silent gallery. There was no teaching at all; people were expected to teach themselves. One or two institutes, the parish organisations, and the chapels with their systems of meetings, lectures, &c., were also at work, but as yet the people did not show the least enthusiasm for art and were content to be amused. The exhibitions, concerts, recitations, and the like did not stimulate them to draw, paint, carve, play an instrument, sing, recite, or act for themselves. But observe, that directly they formed clubs of their own, although they might develop many reprehensible tendencies, especially that of gambling, they did at once begin to act, sing, recite, and dance for themselves. What we wanted them to do, then, was to begin for themselves, or to fall in willingly with those who began for them the pursuit of art in its more difficult and higher branches. We wished that every boy and girl should learn something, and it mattered little whether we made him draw, design, paint, decorate, carve, work in brass or leather. Imagine a time when in every family of boys and girls one should be a musician, and another a carver of wood, and a third a painter; when every home should be full of artistic and beautiful things, and the present ugliness be only remembered as a kind of bad dream. This might appear to some impossible, but it was on the other hand very possible, and sure to come in an immediate future. What he proposed was the establishment of a society for the encouragement of art in all its branches, especially the minor arts, because those could be quickly perceived to have a practical value of their own. There would be local committees, local museums, schools, exhibitions, &c., in which all the teaching work should be done for nothing, and there should be at all events at first no fees. This was not a novel or an impossible proposition. An immense amount of work was actually being done by volunteers; what was done for religion and philanthropy would certainly be done also for art. But when the society had been started by voluntary effort, it must, if it was to succeed, be carried on by the people themselves, and they would have to be paid, but at workmen's wages rate, for teaching in the schools.

A second paper was read by the Rev. W. Tuckwell, who urged that love of art was desired for the wage-earning working class on philanthropic as well as on artistic grounds. Their craving for home ornament and decoration was universal, but the supply was execrable. The most popular, the cheapest, and the loveliest of possible ornaments were flowers, hints for the wider cultivation of which were given. Cheap and graceful specimens of wall-paper, pictures, and ornaments were exhibited, the necessity of direct art teaching in Board schools was insisted on, and stress was laid on the value of music, in which direction again the schools must take the lead.

On the motion of Mr. T. C. Horsfall, seconded by Mr. P. H. Rathbone, it was resolved to recommend to the Council that the papers of Mr. Besant and Mr. Tuckwell, together with the paper read by Mr. Leland, be printed at a low price for general distribution.

Mr. Horsfall remarked that he should go back to Manchester with the intention of doing all he could to form in Manchester a branch of the association Mr. Besant and Mr. Leland proposed to found. He dwelt upon the importance of beginning art education at an early period of life. With regard to exhibitions, they should contain objects more nearly related to the ordinary life of the people than were the objects commonly lent by the South Kensington Museum. He would therefore move another resolution, viz., "That this section recommends the Council of the Association to inform the Science and Art Department that in the opinion of this section the

collections lent from the South Kensington Museum to municipal and other museums would be much more useful than they now are if they consisted largely of things not only excellent in respect of artistic quality, but also fit for the use of the English people."

Mr. P. H. Rathbone seconded the resolution.

Mr. Mark H. Judge wished to be allowed to move as a rider to the resolution a proposition of which he had given notice, having reference to the Sunday opening of museums.

Mr. A. C. Osler said that the question was really whether the national museums should be the means of developing a love of the beautiful for its own sake, or whether they should be maintained for purposes of utility only. The resolution did not seem to advocate the former, but seemed to want to make the museums the means of leading the fashion. If they were to show specimens of what was best in pottery, why should they not show what was best in dresses and bonnets? If this kind of thing were once started the museums would come into collision with the shops, and the door would be opened to no end of jobbery. The resolution was one of considerable importance, and he protested against its being passed, especially in that hurried manner. He certainly hoped that it would not be passed in Birmingham.

Mr. Wilson spoke of the importance of the education of the eye in colour as well as in form. With regard to decoration one-third of the people of London changed their residences every year, and it was not likely that a working man would spend his time painting a dado on the wall of a cottage which he would probably leave in six months. Besides, the landlord would be down upon him for damaging the property. Landlords objected, too, to flower-boxes because they made the brickwork damp.

Mr. E. R. Taylor said that the lines the South Kensington authorities went upon were to choose what was beautiful in form or colour, whether it had decorated the palace of a king or the cottage of a working-man.

The Chairman having objected to any discussion on the papers generally, Mr. Bartlett urged that the resolution was out of order, and ought to be put aside till they had discussed the papers.

After some conversation the resolution was withdrawn.

## NATIONAL EDUCATION IN ART.

THE special question set down for discussion at the first day's meeting of the art section of the Social Science Congress at Birmingham was, "Ought elementary instruction in drawing to be made an essential part of the national education?"

Mr. J. P. Seddon said the subject involved three points for consideration—1st, whether it was possible; 2nd, whether it was desirable; and 3rd, if possible and desirable, what should be the character of the instruction to be given. To learn to draw was easier than to learn to write, and hence it was possible to teach drawing to every person of average ability. The desirability of doing so needed to be regarded both from the individual and public point of view, especially as the latter would include its cost to the nation. Every individual would certainly gain from being thus made more efficient, and therefore more valuable for his work in the world, whatever that might be; and would be also endowed with means for self-amusement and gratification. From the point of view of the public, instruction in drawing was desirable to render its social members intelligible one to the other; for the powers of description of the tongue, unaided by those of the hand, were limited. Drawing, however, by compelling observation, and consequent habits of accuracy, was in reality a valuable system of education in itself. But the strongest reason for making it an essential part of national education was that it would form a material aid to technical instruction. As to the character of this elementary instruction in drawing, unfortunately throughout the western world it was of a wrong nature, and the damage this had already done was incalculable, as it had given an erroneous bias to art generally. By a singular misnomer this had been called "freehand drawing," whereas it was in reality rather cramped drawing. It consisted in setting the pupils not to draw from objects directly, but to copy other drawings, by which means the attention and powers of observation had been concentrated upon lines, and shading, and mannerisms, and details, instead of being shown how to grasp the whole of a subject first, with its essential features and construction. The elementary instruction should be both right in character and thorough. What is wanted is simply line drawing—that is, correct draughtsmanship with the pencil or point, without the stump or the brush, without shading or colour, and this gained by drawing from objects, and not by copying the drawing of others. When pupils have been set to try their hands at model drawing from objects, the vice originally engendered by the "freehand" studies has followed them. How to do it was once exemplified in the North London School of Art, Camden Town. The pupils copied from objects instead of from drawings. Give a student a single object to draw, such as a leaf, the construction of which is obvious, or a cast of one as more convenient, his mind grasps at once the problem that has been put to him. If a drawing of a leaf be given him instead, he looks merely to the lines. If elaborate

"freehand" studies be closely examined, the outlines of the leafage will be found to be distorted more or less. Light, shade, and colour should, in all cases, be left until after the acquisition of accurate power of true draughtsmanship. What was wanted by the nation was, not that every individual should be an indifferent "impressionist," able to give a confused effect of a thing, in slovenly light and shade, or colour, in order to hide inaccurate drawing (which, it must be owned, seemed to be the result of the occidental training in art schools, some few only of the students rising from the general low level), but that every one should be able to draw in clear lines the essence of the objects given, in the manner, for instance, in which the Japanese, as a nation, seemed able to do. The human figure was the most useful, as well as the highest, aim for draughtsmen; but it would be simply hopeless to include it at all in a scheme for elementary instruction, unless it were approached otherwise than at present. Yet carvers, glass-painters, and many others needed it. They required, however, its proportions and its poses, and not its surface; and instead of furnishing up a few noses and eyes, or even whole figures with a stump, they wanted to have the opportunity for sketching correctly a much larger number of figures, on some such system as we know to have been adopted in the Middle Ages. This is to be gained by sketching the human figure in numerous and various attitudes, and not by laborious imitation of the light and shade on its surface. Art has to deal with the visible, and, if the ordinary public can be brought to observe that, and to draw it in a clear and definite manner, all will have been accomplished that could come within the scope of that elementary instruction in drawing which could be considered as an essential part of national education, and as such chargeable at all on the national purse. It was useless to attempt to teach students to draw more than they saw, which it was stated was the case abroad. The anatomy of objects, it was true, regulated their structure; but, at any rate with elementary instruction, it would suffice if this was limited to training the power of the eye to observe, and of the hand to depict what was observable.

Mr. Charles G. Leland said that all the minor or decorative arts were, strangely enough, easy for children of even tender years. In South Germany and the Tyrol infants of six years of age carved wood so well that their work had a market value. In Spain art-pottery of a very high standard was made by very young boys and girls, and in Italy the same small artists did as well in mosaic-setting, fancy basket-making, and other arts. In Egypt the young of both sexes executed embroidery, inlaying, *repoussé*, and even jewellery, with a degree of skill which in Europe no one expects save from grown-up and highly-trained artists. He made an experiment with two classes of a hundred pupils each in Philadelphia. The industrial branches actually taught with full success were embroidery, painting (chiefly in monochrome, in water-colour and oil), setting mosaics, modelling in clay with colour and glaze for firing, stamped sheet leather work for furniture, sheet metal work or *repoussé*, wood-carving, and easy carpenter and cabinet-making work, with turning, fret-sawing, and inlaying. Soon he realised that it was necessary that every pupil must first learn how to draw, and to determine what kind of drawing this should be. The drawing should serve as a correct beginning for every other kind of art. If a child begins by learning design and drawing simultaneously, and gets so far as to be able to execute a correct pattern fit to be put in hand to work out, that child can, after a little manual practice, master all decorative arts. The result of hundreds of experiments, with unwearied study of the character and capacity of every child, convinced him that all are capable of learning original design, if it be properly taught. The result is an increased quickness of intellectual perception or intelligence, so that literary studies are also more easily mastered. The pupils, when merely half taught, were eagerly taken into foundries, carpet factories, &c., as paid learners. Even farm labourers, colliers, sailors, and all working-men can be aided. All occupations have a cultured side, and we must awaken attention and quickness of perception by a peculiar training of which drawing is a part. All hand-arts are only drawing developed in different forms. He began by teaching what is technically known as "the vine," in from 20 to 40 lessons. The pupil was taught, after the first lesson, to design, and not to merely copy. The use of compasses, rules, and curves was not only allowed, it was insisted on, as training the eyes to accuracy. Drawing, as generally taught, on the picture-making plan, is a mere accomplishment, not worth the extraordinary expenditure of time and money which it has occasioned. To answer the question, "How can you at little extra expense introduce not only design, but arts, into every village school in the country? Who will be the teachers?" he wrote for the Commissioner of Education in the United States a pamphlet, of which 60,000 have been given away. The result has been the introduction of drawing and its application to art in hundreds of schools and families. The pupil should be taught to design from the beginning. The learner should be told to design a vase, a frame, a fan, a book-cover, a pair of bellows, a cabinet or chair, but always something definite, and not fritter away time on abstract arabesques with no immediate aim. Much examination had convinced him that there are ten persons who can learn to draw well where there is one who can write a really good hand.

In England the Cottage Arts Association has now under way several scores of schools, but this is only a mere preparation. Drawing means something more than making lines on paper—it should also include the working out the drawing in some other material. Scientific design based on geometry, and involving the conventionalising of flowers, the rules of perspective, &c., is for elder pupils who have time. For a child of from eight to fourteen, who can only give one afternoon or evening in the week to drawing and its applications, these advanced methods are impossible. All over Europe and America there is a rapidly growing, deeply seated conviction that industrial art, manual labour, or the exercise of the constructive faculties should have a part in even elementary education. For this drawing must be taught. The question is, "What kind of drawing?" The reply is, "That which lies at the root of all design."

Mr. Rowland Hamilton said the due exercise of the eye, regarded merely as an organ, tends to its healthy development. Canon Routledge, inspector of schools, when the subject of colour-blindness was under discussion, wrote to the *Times* that he had never found a case of this defect in a child who had been properly trained in an infant school. The training implied would consist of lessons in "form and colour." Early training enables the hand to trace what the eye actually sees. Early training in drawing should be under the direction and influence of those who are profoundly imbued with the true knowledge of art. Everything that is bad and false in art should be inexorably excluded from the school; nor is all that is good in art suited for the purposes of instruction in its earliest stages. Infants want the simple phases of moving life depicted to them. Primary faculties themselves are only developed by degrees; delicate contrasts and harmonies are lost upon young children. Given a well-trained power of observation, and a hand with some ability in delineating that which is discerned, we have another "gateway of knowledge," another mode of expressing facts and of conveying useful information. In the late war the French not only suffered from the want of maps, but, from want of practice, few could make full use of them. The "graphic method" is coming largely into use in many recondite questions for the clear expression of numbers and quantities. The nature of the processes of simple arithmetic can be made apparent with very few units, whether of forms or of figures. Professor Clifford had it in his mind to write a geometry for the nursery and kindergarten. There are abundant indications that a course of training which will at all events tend to bring the population into some familiar contact with art will meet with an ample response.

A paper by Miss Sophia Beale, which was read by the President, pointed out that drawing has made little advance in ordinary schools of late years. Girls are still taught to paint before they can draw, and are allowed to fritter away their time in pencil drawings of ruins, &c., as of old; or "chalk" heads, or porcelain, faience, lustra, tapestry, and crystoleum painting, and other new-fangled nonsense. Art schools have done much for professional workers, but the amateur is as ignorant as ever. Art is a great deal talked about, but is little practised except in spoiling good house-paint by so-called decorations. Nor is sufficient time given to drawing at schools. Music being a showy accomplishment, has two hours a day spent on it—drawing only two hours a week; but the result is much the same. The one makes a girl a nuisance to all within hearing; the other enables her to sketch in a weak manner without any perspective. An art education should before all things cultivate and improve the taste, so as to make persons appreciate what is noble and good in art. This is done more in France than in England. If drawing were better taught this would not be. All children should learn it, as it is the only way to teach observation. But they should be made to draw common objects from nature, not senseless uninteresting curves. School-rooms should have photographs, prints, copies, casts, &c., of good works upon the walls, to educate the eye at odd times. As to mediums, *papier Ingres*, charcoal, and stumps are the best. No niggling should be allowed. Stability of purpose is much wanted in England. French girls work more steadily—even those "in society." Here they work one month, and then fritter away two or more. Real work in drawing should be done in school days, otherwise it becomes to other girls slavery. Scales and exercises are insisted on; why not serious drawing? Men and women amateurs are not wanted to be artists, but intelligent connoisseurs. This is what art education ought to do; and were it made a part of general education, instead of an "extra," it would do so, as teachers then would be independent, and school-mistresses would not be obliged to send home "pretty pictures"—daubs in water and oil-colours, and wretched "chalk" heads all out of drawing, in order to please parents and make them think they have their money's worth.

Dr. Heinemann expressed his belief that the English people had as great a natural faculty for art as any Continental nation.

Mr. E. R. Taylor advocated the teaching of drawing in infant schools so soon as children should be able to hold a pencil.

Mr. T. C. Horsfall said the training in our Board schools was so good and quick that the brightest children were turned out in large numbers about the age of twelve, and in the years which followed they often forgot what they had learned. Thus it was

that the duller children, who had to remain at school longer, reaped an advantage over their brighter companions. He thought there was a strong opinion growing up that we must have compulsory attendance at evening classes up to the age of fifteen or sixteen years. At these classes art must be taught, the brighter kind of education, such as music and drawing, being essential to the success of the education to be given.

Mr. P. H. Rathbone said that at the present time there was being produced a number of artists who were absolutely useless to the country, because they turned their attention simply to a certain class of work of art which was of less practical value.

In concluding the discussion, the President spoke in highly eulogistic terms of the papers which had been read. Mr. Hamilton was very strictly logical in establishing his view. Those persons who, from benevolent motives or worse feeling, went into art schools and were appalled by the series of models—the same everlasting busts—would be glad of the opinions expressed by the readers of the papers. The discussion had really been in effect a vigorous protest in favour of common sense, and of the employment of an appreciation of human nature in art studies.

## WORKMEN'S DWELLINGS IN LARGE TOWNS.

THE Health Department of the Social Science Congress were engaged on the 18th inst. in considering "What are the best means, legislative or other, of securing those improvements in the dwellings of the poor which are essential to the welfare of the community?"

A paper was contributed by Mr. John Hamer, honorary secretary to the Mansion House Committee, on "The Dwellings of the People." It was said that the question was a broad one, and affected the well-being of every member of the community, no matter what his or her station in life might be. The fact that improvements in the dwellings of the people were essential to the health of the nation lifted the question far above the region of class interests, and endowed it with national importance. If a healthy body was conducive to a sound mind, how much more more healthy dwellings to an intelligent commonwealth? It was from this standpoint that he discussed the question. All classes alike were lamentably in need of improvements in their habitations and surroundings. Amongst the "other" means for remedying the particular evils, the writer placed in the foremost rank associations of men and women whose object was, by personal visitation of and familiar intercourse with the masses, to arouse such feelings of sympathy, hope, and courage as should educate the people themselves to a proper degree of decency. This once done, the rest would follow as a matter of course. The building of better houses for the people, when undertaken and managed on commercial principles, is strongly to be commended, but the results in London have not, so far, been all that could be desired. We have got the houses, but we have not got the right class of people in them. The rents are too high for the labouring class. The machinery at present at work for enforcing the laws of sanitation is terribly deficient. For 4,000,000 people, living in 500,000 houses, the wealthy metropolis generously provides fifty medical officers of health, who do not average a couple of inspectors each to assist them. That is to say, each sanitary official has to look after the health of 26,000 persons. The Local Government Board issued a circular urging the district authorities to put in force the regulations as to houses let out in lodgings. Out of the thirty-nine governing bodies in London, how many have complied with this suggestion? Not half a dozen. The Royal Commission sent out blank forms asking their aid in the collection of statistics vital to the efficiency of their inquiry, and the responses have been practically *nil*. District surveyors when they bring an action against any one for infringing the Building Acts do so at the risk of having to pay the costs of the action out of their own pockets if they fail. Twenty-two thousand persons have been compelled to leave their insanitary homes under the powers of the Industrial Dwellings Act. Accommodation has been provided for 14,000 of these. Where meanwhile are the 8,000? Nuisances have to be sought out. The power to delay, postpone, and ultimately defeat by sheer procrastination, is one of the worst evils the would-be sanitary reformer has to contend with. The outbreak of infectious disease has to be watched, and the measures taken to prevent its spread. The sanitary authorities exist rather for the removal of nuisances than for the prevention of disease. With regard to disease produced, say, by infected milk, they can do nothing until disease has been produced by its consumption. After a site is covered, houses built, and inhabitants exposed to ill-health or lost their lives, London thinks it well to give to the sanitary authorities power to act. Prevention should be the base of all sanitary regulations. We should adapt our official machinery to our altered circumstances, and create a Ministry of Health and Education. The health of the people and the education of the people are so vital to the whole nation that their regulation should be a national, in other words a State, affair.

The Rev. H. Solly said that everything in the paper was worth attention as useful information or valuable suggestion, but he him-

self thought the great remedy was taking the people back from the towns to the country.

Dr. B. W. Foster said he was connected with an inquiry which was made in Birmingham in reference to the dwellings of the poor. The result of that inquiry was unsatisfactory to some people, because the authors of the report were unable to deal with any sensational disclosures or recommend any great radical changes. But he thought that result ought to be exceedingly satisfactory to the inhabitants, because it meant that the dwellings of the poor in Birmingham were in a very fairly satisfactory condition, that they were not very crowded, and it was discovered that little outside interference was necessary. Only twelve instances were found of whole families living in one room. He only wanted to contrast the results obtained in Birmingham with the cry which the miserable outcast of London presented to the country not long ago. If London had a corporation as active as the Birmingham Corporation, if it had the same cohesion in the administration of its municipal affairs, the terrible condition of things which existed in London would soon cease to be. He hoped that under the present Government, or under some other, a better condition of things would be brought about in the metropolis, and that London would cease to be a great blot on English civilisation. Dr. Foster recommended outside interference in the way of effecting cleanliness, until the people, by seeing the picture of cleanliness presented to them, would learn its worth and adopt the principles of cleanliness themselves, and so relieve the authorities of the necessity of outside interference. He warmly advocated the suggestion made by the writer of the paper as to a Minister of Health.

Mr. Shaw-Lefevre said if it was true, as stated, that in Birmingham the recent inquiry revealed the fact that there were only twelve cases where more than one family dwelt in a room, he could only say that it was a condition of things very different to that of many other large towns. In London there were thousands of such cases, but the case of London, in a sanitary point of view, was more difficult than that of any other town. That was due to many causes. The value of property in the centre of London rendered it almost impossible for workpeople to obtain houses at a cheap rate near their work. There were two kinds of legislation affecting the dwellings of the poor—one, the Torrens Act, which dealt with individual cases; and the other, Sir R. Cross's Act, which dealt with collections of houses. The Torrens Act could not be improved for the purposes for which it was intended; but both Acts required intelligent local action. If we could get a good authority to carry out these Acts in various localities, we should to a great extent solve the difficulty. The Cross Act was more difficult to deal with, and he had himself carried an amending Act in 1882. The original Act enabled local authorities to destroy whole districts of bad houses. In many cases this was the only possible method of dealing with them, but on the condition that we built artisans' dwellings on the sites. The difficulty in such cases was the enormous cost of the land so taken, and he was surprised that the Metropolitan Board of Works had done so much. Many of the houses had been removed at a cost of 500*l.* for each family. The Act of 1882 provided that artisans' dwellings need only be built upon one-half of the site, leaving the other to be used for commercial purposes. It had been shown by investigation that the people who were turned out were not living in the houses because they were near their work, but that in many cases they had to traverse the metropolis to go to their work, which was sometimes in the suburbs. Under those circumstances there did not seem to be any particular necessity for the local authority to build the houses on the same site when land could be procured elsewhere, and perhaps nearer the work of some, at a cheaper rate. It might be questioned whether the Act might not be further amended in this respect, so as to permit freedom of action on the part of the local authority. A serious consideration was that of compensation to the owner of the premises. It was the intention of Sir R. Cross's Act that they should not be compensated to their full value, and no doubt he believed that that would reduce the cost of the site, but the Act had fallen into the hands of technical men, who seemed to be very much impressed with the value of land, and conservative ideas of that kind were to be found in the minds of the arbitrators who dealt with the subject. The consequence was that owners obtained compensation to amounts which to him appeared preposterous. The question was whether owners who had allowed property to go into such a bad state and to become a nuisance to the neighbourhood ought to be compensated to the full extent in the ordinary manner. The houses were bought and sold for letting in tenements, and when the lease had only a few years to run the owner would do no repairs, thinking it was not worth while, as at the end of the lease the site would be taken. Was such an owner to be compensated in the ordinary way, or were we to take into consideration the fact that there was a moral obligation on his part not to turn out the people who had been living on his premises from time immemorial? If they were taken into account, as he thought they ought to be, the compensation to be paid ought to be very much reduced. Then came the question of compensating the middlemen. Many of these houses were held by men who took them on a lease at a low rent, let them to poor families, and in that way made a large income. The present system of compensation to such men was that the difference between the

rent they paid and the income they received was taken and capitalised, and the result was another enormous sum for compensation. Before the Royal Commission he had ventured to contend that such people ought to be compensated on the basis that they were business men. They devoted their whole time to this as a business, and they ought to be compensated in the same way as any other persons whose business premises were taken from them. If such a principle were to be adopted it would work out a great difference in the sum of the compensation. They might also reduce the cost by reducing the rate of interest charged by the State. It was Sir R. Cross's intention that the State should advance money at low interest for the purpose of purchasing the sites, but an Act of 1879 raised the rates of interest. It might be wise to return to Sir R. Cross's original intention, and by reducing the rate of interest give assistance to the local authorities in that way. The continuance of the bad state of things in the worst parts of London was not due to the mismanagement of the local authorities, but to the state of the law, which did not provide methods for preventing owners misusing their property. In that view, he believed it to be a legitimate object for the State to contribute towards clearing such sites, and that could be done in no better way than by advancing money at low rates of interest. These were points in which the Acts might be amended to enable local authorities to put them in force. He was strongly averse to the local authorities building for themselves; that was better left to private enterprise. Nothing but mischief would result from the local authorities providing houses for the poor. What they had to do was to put a stop to the mischief which already existed.

Professor Gairdner said that the action taken in Glasgow had been largely beneficial. The population which had been displaced was the better for it. He did not see any principle by which the local authority could step in and become landlords without seriously interfering with the law of supply and demand. The principle upon which the work ought to be done was that of upholding the good and condemning the bad; so that if a man built a house he would be certain that if it did not satisfy the authorities it would have to come down. If that rule were made and rigidly adhered to it would prevent the monstrous evils which had occurred in many great towns.

Mr. H. H. Collins said he had successfully advised manufacturers to take their works into the country, and, of course, the workpeople must follow the works. Thus land in towns might be left to realise its commercial value.

Mr. Hurst said that rural labourers were driven out of England by being compelled to live so far from their work. Good cottages, he found, would attach them to the soil.

## THE RESTORATION OF WESTMINSTER ABBEY.

WHAT will certainly be the most extensive restoration that the exterior of Westminster Abbey has undergone during the long course of its history has, says the *Standard*, now fairly commenced, and for several years to come workmen will be engaged in operations which, when completed, will literally have put a new face upon the greater portion of the fabric. It is not proposed merely to reface the exterior and to reproduce every detail exactly as it now exists. The restoration will be far more complete than this, inasmuch as the plans include the removal of many excrescences and disfigurements which the bad taste and ignorance of successive architects, chiefly during the seventeenth and eighteenth centuries, led them to engraft on the original. The object is, in fact, to restore the Abbey to the condition in which it stood when it was in charge of such masters of Gothic architecture as Abbot Islip, and before the debased style of Gothic art came into vogue.

Only those who are thoroughly familiar with the history of the Abbey can have any idea of the extent to which the outer fabric has from time to time been renewed. In the popular imagination the building is looked upon as a whole, equally ancient in all its parts, but as a matter of fact there are centuries of difference between the dates at which various portions were erected. Few are aware, for instance, that the splendid exterior of Henry VII.'s Chapel is an entire restoration completed as recently as 1822, and, fortunately, needing no renovation now, though there are marks of decay which seem to indicate that this part of the church will also again have to be dealt with in another half-century or so. Henry VII.'s Chapel is not included in the scheme of restoration submitted to the Dean and Chapter by Mr. Pearson, R.A., the architect to the Abbey. Neither is it proposed to touch the cloisters, for although the outer skin of the stone of which they are built appears to be in a very decayed condition, and crumbles away at the touch, the roof, which has only its own weight to bear, will last for a long time yet, being of course, comparatively sheltered from the effect of the weather.

The work of erecting the scaffolding from the top to the bottom of the north transept is being rapidly accomplished, this being the first section of the Abbey with which it is intended to deal. After this part has been restored the work will be continued on the south side, and the east and west points will subse-

quently be taken in hand. Various experiments have been made with the object of determining what is the most suitable material for the work, and it has finally been decided to use the hard grey stone, procured from the Chilmark quarries in Wiltshire, which possesses special properties of resistance to the muriatic and other deleterious acids with which the London atmosphere is charged. Until the work has been in progress for some time it will be impossible to determine the precise extent to which the restoration of the fabric will have to be carried; but as we have indicated, it must necessarily be of a most extensive, and certainly will be of a very costly nature, the funds, it is understood, being provided by arrangement between the Government and the Ecclesiastical Commissioners. A staff of forty or fifty masons will be engaged, and their operations will in all probability extend, at the least, over a period of about five years, although the work will be pushed on as speedily as possible under the superintendence of Mr. Pearson, who has a most efficient and zealous coadjutor in the person of Mr. T. Wright, the Clerk of the Works to the Dean and Chapter.

## ART AND POLITICAL ECONOMY.

ONE of the voluntary papers read at the Social Science Congress was by Mr. P. H. Rathbone, upon "The Place of Art in the Political Economy of a Nation." The main object of art, he explained, was to do whatever we had to do so as to be of most use and give most pleasure. For many years we had devoted ourselves with considerable success to being the cheap-jacks of the world, for should America repeal her insane protection laws, our manufacturing supremacy, as far as cheapness was concerned, would probably become a thing of the past. It behoved us, therefore, to manufacture the best and most tasteful fabrics rather than the cheapest. The general world smiled when, a few years ago, sound art was introduced in wall-papers; but the result had been that we were exporting good instead of cheap wall-papers. Mr. Rathbone pointed out the effect of the Exhibition of 1851 in stimulating the potters to the study of art; and the example of Birmingham, and especially the work of Messrs. Elkington, served to show the pecuniary success attending the development of art. As it was, for the want of art education, much highly-paid artisans' work fell into the hands of foreigners. He could not altogether absolve trade societies from blame in this matter, as the objection to having wages regulated in proportion to the skill and industry displayed, which they had occasionally evinced, was most immoral and demoralising. It was not, however, only necessary that our workmen should be artistically trained; they should live in an artistic atmosphere, among a public ready and able to appreciate and criticise their works. Through a more thorough artistic education we should enable our handicraftsmen to turn from an overstocked occupation to one understocked, and thus render their intelligence and labour more mobile and fluid. At the present moment we were face to face with a very perplexing paradox. With the main necessities of life—food, clothing, and shelter—over plentiful and cheap, the best-informed employers were looking forward to a period of more than ordinary distress among industrious workmen during the coming winter. There was, he thought, a permanent cause for this. These main necessities could now be supplied by working, say, seven hours instead of ten hours a day, as formerly. This would be all well if the workmen all worked seven hours per day; but, as a matter of fact, seven-tenths worked ten hours a day, and three-tenths looked on with idle hands. The remedy was that the three-tenths unemployed should produce the means of making the lives of the other workmen brighter, happier, and more varied than at present. It required time, of course, to cultivate a love of art, but it might be done by art galleries and museums, by concerts and theatres.

The President expressed the great interest with which he had listened to the reading of the papers, and remarked that Mr. Rathbone had shown by arguments tersely and convincingly put, what a delicate relation there was between art and the economic laws of the universe. The ideas contained in the paper would push themselves to the front as the only means, if carried out, of maintaining the present footing of this country amongst other nations.

## GILCRUX CHURCH.

AN application was made lately to the Chancellor of the Diocese of Carlisle for a faculty to make the following alterations among others in Gilcrux Church:—To take down a portion of the north wall at the east end of the church and to build one bay of the north aisle with a temporary wall across the west end of it, and to fit it up with seats for the accommodation of school children; to take off the roof of the present heating cellar, and build a vestry over the same; to take down the chancel arch, and to re-erect it stone for stone in a wall to be built between the north aisle and the vestry, and to let in the wall alongside of it a panel of freestone with an inscription cut on it stating that this was formerly the chancel arch and the date of its removal; to insert a new chancel arch eleven feet in width, and to build up and make good

the wall above it; to take down the font from its present position, and refix the same at the west end of the south aisle. Mr. C. J. Ferguson, the architect, stated that the plans originally deposited were for a portion of the north aisle, but his lordship the Bishop thought it would be better to carry out a completed scheme, and therefore he, at the suggestion of Mr. Pigott, had prepared plans for the complete scheme, which he now put in. In the carrying out of the work there would be two graves at the west end that would be slightly interfered with, but every precaution would be taken in this case. Gilcrux Church was an Early Norman one, and was a church of some interest, so they might rely upon it that every care would be taken. The chancel arch which they were proposing to take down was a Norman one. It was only five feet wide, and practically divided the church into two buildings. They did not intend to tamper with or injure the arch, but to rebuild it as stated in the application, so that it would be preserved intact. The font also, which was proposed to be removed, was a Norman one, and retained in it the old lead holes, showing that at one time a font cover was locked to the font to prevent the water, which was thought to have some magical power, from being stolen. The north side of the church was that to which additions could be added with the least injury. It was a very curious thing that the church possessed a Norman aisle on the south side. The Chancellor asked what they proposed doing with the space where the old arch was to be removed from? Mr. Ferguson said they proposed to build a new arch 11 feet wide. The Rev. J. C. Pigott said the old arch at the spot where it was to be rebuilt would form the entrance to the new vestry, and would be screened off by a curtain. The Chancellor said he wished it could have been kept in its old position, but it appeared that it was an obstruction there. Mr. Ferguson thought it would be wrong if in carrying out the alterations they should, instead of removing the arch from its present position, widen and mutilate it. The only thing was to preserve it intact. The Rev. J. C. Pigott said the cost would be about 180*l.* or 190*l.*, and he had the greater portion of the money on hand, but he was prepared to enter into a guarantee for the remainder. At present they were without a vestry, and they wanted seats for their worshippers. The population was increasing, and the church was frequently well filled. He thought it would be better if the new chancel arch were 9 feet wide instead of 11 feet. Mr. Ferguson said he thought Mr. Pigott was rather sanguine in the view he took of the cost. He (Mr. Ferguson) had made no estimate of the cost of the work, but he thought it would be about 250*l.* The Chancellor decreed a faculty to be issued to that extent, leaving it with Mr. Ferguson to say whether the arch should be 9 feet or 11 feet wide.

### LOCAL AUTHORITIES AND ART.

THE paper which was read by Mr. T. C. Horsfall at Birmingham was on the question "Are local governing bodies justified in expending large sums of public money for the purpose of beautifying towns and of providing parks, playgrounds, and other facilities for public recreation, and, if so, what are the lines on which they can most advantageously work?" He took for granted that everyone believed it to be the duty of the community to provide for each class those things which it could not provide for itself, and could not lack without great injury to the whole community. He held, therefore, that if he showed that through the failure of local authorities to make towns beautiful, and to provide facilities for recreation for the working classes, grave injury had been caused to the whole country, the question he had to discuss must be answered affirmatively. Pointing out that many children in towns did not know how to play, and that a great many ratepayers, having never learnt to care for beauty either of nature or art, would be opposed to the provision of art galleries, parks, &c., at the cost of the rates, he argued that the help of school managers was needed to teach all townspeople to take wholesome exercise and enjoy beautiful things, and urged that all children should be taught at school how to play games and use gymnastic apparatus, and that all schools should be provided with small collections of pictures and other works of art. He mentioned that in Manchester and Bradford associations had been formed for the purpose of lending pictures to local schools; that the London Art for Schools Association enabled managers of schools in any part of the United Kingdom to buy good pictures at low prices; and that the French Government had lately prepared a series of beautiful photographs and casts of sculpture and engravings for use in French schools of all grades. He then recommended that town councils should make existing playgrounds in towns, including those of all schools, out of school hours, of more use by providing them with gymnastic apparatus and well-trained custodians; that covered gymnasia, like one which had been at work successfully in Manchester for the last two years, should be provided for use in dark evenings and wet weather; and that every large town should be provided with several art galleries similar to one which had been partly furnished in Manchester by the Art Museum Committee, and in which good art was shown applied to things used in the homes of all people of the middle class and of many workpeople. He said that town councils ought to provide large towns with an almost

complete ring round the towns of open spaces, partly consisting of parks, partly of play-fields; but that there was no chance of work so costly being done, as many ratepayers could hardly afford to pay their present rates, unless the inhabitants of large towns acquired the power of including the suburban districts, the inhabitants of which got most advantage from new parks, within the municipal boundary, without the consent of the inhabitants of the suburbs, and unless the owners of land in towns were made to contribute to the municipal revenues.

Dr. Yates approved the views of Mr. Horsfall, and thought that local authorities were more than justified in expenditure on these objects.

Mr. F. Wilson thought that our churches ought to some extent to be also picture galleries for the people.

The Rev. H. Solly warmly sympathised with what Mr. Horsfall had said in favour of turning back the influx into towns from rural districts.

### THE MODERN THEATRE.

A PAPER on "The Drama" was read by Mrs. Kendal at the meeting of the Social Science Congress on Tuesday. The following is an extract:—Let us compare for a moment the play-houses of which we read with those with which we are familiar. In the old days the utmost disorder was allowed to exist in the half-lighted auditorium. Eating and drinking were freely indulged in; smoking was permitted; wine, spirits, and tobacco were hawked about; card-playing was resorted to between the acts; the more distinguished among the audience were allowed to walk and sit on the stage and to converse with the performers. It was no disgrace in those days for gentlemen of good social position to be seen tipsy at a play, and of course drunken brawls and disgraceful quarrels were of frequent occurrence. The entertainment provided on the stage was on a level with the intellect of the audience, and the players were looked upon as "rogues and vagabonds." No wonder that the drama got a bad name, and that people of a puritanical turn of mind regarded it with dismay. Of course, all this is going back a very long way. Matters began by degrees to improve. But I venture to say that it was not until the present generation that correctness in costume, fidelity in scene-painting, and attention to every little detail connected with the action came to be looked upon as absolutely essential to the proper production of a play. Nowadays, indeed, that which is technically known as the staging of a play is in itself a work of true art, and in its own way gives rise to as much thought and care as the author applies to his dialogue or the actor to his part. It has been objected that too much attention is apt to be given to scenery, furniture, and accessories, and that there is a danger of the drama suffering from over-elaboration in this direction. In plain English this means that a thing may be too well done. It seems hard to subscribe to such a theory. Our forefathers, you will remember, were content with a background for their plays, on which the name of the place supposed to be represented was written up, such as "This is Thebes," or "This is a forest," or sometimes even this trouble was not taken, and the actors had to inform the audience where the action of the piece lay. "Our scene is Rhodes" is the brilliant opening line given to an actor in an old drama. These crude arrangements gave way to the introduction of scenery, but it was a long time before anything like correctness was attempted, and we can most of us remember the days when there was no complaint of the thing being "over done." Can it be over done? If a scene is to be represented at all, can it be given with too much truth or attention to detail? Of course, lack of judgment spoils everything, and it is very likely that mistakes in this direction have given rise to complaint. It is useless to lavish mere money on a scene. If the interior of a peasant's cottage is to be represented much expenditure on the furniture would be ridiculous. But surely the artistic care that reproduces the humble home of the labourer down to such details as, say, the "sampler" stitched in silk which his wife worked when a girl at the village school, and which now decorates his walls, is a thing to be admired. Again, if the scene is a landscape ought it not to be made as true to lovely nature as the resources of art will allow? Or if it is a room in a palace, can it be too beautifully given? If the surroundings and minutiae of such scenes are correct and in good taste, they must add not only to the enjoyment but to the education of an audience; for it may be reasonably supposed that the frequenters of the less expensive seats in a theatre have not many opportunities of becoming familiar with interiors of palaces, and it is certain that the jaded city clerk who seeks a little recreation at the play does not see too much of landscape, nor has he a very intimate acquaintance with the indescribable attractions of an English villager's home. Perhaps it would be well for those who are disposed to be satirical concerning what they call over-attention to detail and over-elaboration, to give a thought to this side of the question before airing their opinions. It may even, I think, be conceded that in matters of scenery the improvements are not only great but remarkable. The comfort of the audience, too—is not that considered nowadays as it was never considered before? For obvious reasons I do not often form one of an audience.

myself, but I should certainly think that good light, attention to warmth and ventilation, soft cushions, ample room, good music, and, above all, cleanliness, are things to be appreciated and added to our list of improvements. And while advances in this respect have been made before the curtain, equally great ones have taken place behind it, and actors and actresses are at last surrounded by the conveniences and comforts which gentlemen and ladies have a right to expect. For the improvements—the great improvements—made in this way, honour should be given where honour is due. It was the manager of the London Prince of Wales's Theatre that some seventeen years ago first paid attention to the comfort of the artists engaged, and made the theatre behind the scenes what it now is. This fact should be recorded, because praise is too often given to those who have only followed a good example.

### PRODUCTS OF COMBUSTION.

IN the Health Department at the Social Science Congress, on the 18th inst., Captain Douglas Galton read a paper on "What is the best Method of Dealing with the Products of Combustion?" Referring especially to the matter of smoke, he said that an important method of smoke-prevention, in connection with manufactories, will be to change the rough-and-ready process which we now adopt of burning raw coal into the more scientific method of using gaseous fuel. It was not by methods for improving the consumption of crude coal that we should ever arrive at freeing the atmosphere from smoke. To do this effectually they must resort to gas. Nearly thirty years ago the late Sir W. Siemens endeavoured to introduce into this town gas for heating purposes, both for manufactories and for houses. The opposition of the then gas company prevented this grand experiment, and it had been in abeyance ever since. Still, various industries had succeeded in abolishing smoke by the use of gas, as, for instance, Messrs. Minton, who have done so in their pottery kilns at Stoke, and the use of gas had been extended to baking and other ovens. It was needless in this district to refer to the various improved methods of iron machinery by which smoke is avoided. As to smoke produced in domestic fireplaces, both for cooking and warming, it might be said in general terms that when the fuel is burned in a close stove it is possible to obtain comparative absence from smoke; but there is no doubt that, if smoke abatement be the object to be attained, it is to gaseous fuel in our kitchens that we must look for the solution of the question. Captain Galton concluded by saying that if a cheaper gas for heating purposes were furnished by the corporations in towns or by gas companies, there could be little doubt that the great convenience and cleanliness resulting from its use would soon lead to the abolition of our smoke-giving fires. If they were ever to obtain an atmosphere free from smoke over the vast aggregation of buildings of which our towns are now composed, they could only do so by abandoning the crude method of burning coal in the manner of their early ancestors, and by resorting to the more scientific method of using gaseous fuel.

### THE NEW GOVERNMENT OFFICES.

AFTER the address by Mr. Beresford-Hope had been delivered at the Social Science Congress, Birmingham, Mr. Shaw-Lefevre rose to express the thanks of the members to Mr. Beresford-Hope for his address. As Minister in charge of Her Majesty's public buildings it had been his duty to carry out a policy different from that advocated by the right hon. gentleman. Within the last few months he had had to take part in the selection of a design for the new offices for the Admiralty and the War Office; and he was sorry to say he had not been able to accept the style preferred by his right hon. friend. As the right hon. gentleman was reading his last sentences he could not help thinking that they had been penned to be addressed, not only to the Association, but also to the First Commissioner of Works. This might not be the portent of a new Battle of the Styles, but it might be a suggestion that in the future he should appreciate Gothic rather than Classic. For the new offices 127 architects sent in designs; and only six of these were Gothic. Nine were selected for further competition, and of these only one was Gothic; and that was not the design finally selected. He was actuated by no prejudices upon the subject; he only acted upon the principle laid down in the address that the building should be for the man and not the man for the building. He hoped that although the design was not Gothic a satisfactory building would be erected. Within the last twenty-five years three great public buildings had been erected in London; two of them were Gothic and one was Classical; and one of the Gothic buildings was designed by an architect who was a Classical rather than a Gothic architect, Sir Charles Barry. Next, Mr. Gilbert Scott was directed to produce a Classical building for which he was not specially competent. The next was by a purely Gothic architect and in the purest Gothic style. He believed that Mr. Beresford-Hope was an admirer of it; but whether his opinion was shared by the

public generally he would not say. Thus we had two Gothic buildings and one Classic building; the Classical building was not erected by a Classical architect. It was now proposed to have a fourth building in the Classical style, and by a purely Classical architect; and he hoped he should not find his right hon. friend one of the opponents of the design in Parliament. He must thank the right hon. gentleman for having assisted him on many occasions in the performance of his duties in the House of Commons. Whenever it was necessary to appeal to the House of Commons on a question of public interest he was certain that that appeal would be received by the right hon. gentleman in a spirit entirely free from party exclusiveness, and that his right hon. friend would be animated by the purest motives based upon conviction.

Mr. Beresford-Hope said that he was much touched by the concluding words of his right hon. friend, in whom he had, whether this style or that were adopted, a Minister who understood his work, and long experience of the House of Commons had led him to look for the selection of a First Commissioner of Works not solely on the ground that he understood what he had to do. There was once a First Commissioner who understood his work and tried to do it, but he was contemptuously hustled out of his office. Undeterred by the awful example of Mr. Layard, Mr. Shaw-Lefevre had started on the same plan of action, and had gained the respect and confidence of all whose respect and confidence were worth having. Under our constitution government by party was an absolute necessity; but to bring party motive into art questions was simply detestable. Unregenerate human nature often fell into the temptation to do so; but he trusted he should always be found standing up for the Liberal Minister who had a love for art, and resisting a Tory Minister who had not.

### THE LEASEHOLD SYSTEM.

THE special question which was adopted for discussion in the Section of Economy and Trade at the Social Science Congress on the 18th inst. was the following:—"Would it be advantageous to give to leaseholders powers entitling them to the purchase of the fee-simple of the lands and premises they occupy, or otherwise to interfere by law with the prevailing system of building and other long leases?"

Mr. John T. Emmett read a paper, and gave a description of the method of procedure in the manufacture of leaseholds, by which it appears that the legal costs are heavy, and are needful only because the system is cumbersome; that as a contrivance for inducing wretched building work and miserable houses for the population no more clever and efficient system could have been invented; that leasehold leases are inconvenient and the building is bad; and that this bad system is, in the metropolis and other districts, rapidly extending. The system was then shown to be enormously disadvantageous to the leasing freeholder, whose property is taken by the lessee at an abatement, owing to the nuisance of the tenure, of some 25 per cent. below the freehold value of the land. The reversion to the freeholder, at the end of the lease, of the lessee's property in buildings is only worth one-eighteenth part of the 25 per cent. and compound interest lost by the effect of the lease, which 25 per cent. moreover, had it been continuously employed in trade for ninety-nine years, would have amounted to about twelve hundred times as much as the reversion. This loss is ruinous to territorial families, and keeps their junior branches constantly impoverished. The notion that there is any protection to the leaseholder by the influence of a lease is shown to be fallacious. There is bondage but no protection. Otherwise, why do not freeholders seek to avail themselves of such protection by surrendering their estates in fee to some less wary overlord? Leasehold tenure is not the only cause of evil to house property but it is a most malignant evil; and near London, and in many leasehold towns, the inferiority of leasehold houses to the corresponding work in freehold districts is remarkable. Enfranchisement would be gradual in its operation, and in due time universal, thus improving the condition and morals of the entire population.

Mr. J. S. Rubenstein read a paper, in which he said the enfranchisement of copyholds was the achievement of the last generation. The enfranchisement of leaseholds seems destined to be the achievement of this. As to the evils of the present system, there is, and there can be, no dispute. Sir George Jessel once said that if lessors were to enforce their rights, leases would not exist for six months. Relief against forfeiture is given far more readily than before, but the inherent evils remain. The occupying owner is still but a precarious tenant, whose interest is steadily lessening. In large towns it is almost an impossibility to obtain a house fit for the lessee's purposes, except upon lease. The landlords are masters of the situation; you must take on their terms, or go without. The fact that their terms are agreed to is the strongest proof of the utter helplessness of the public error of believing that so long as the lessee pays the ground rent he can do what he likes with the property. He cannot improve it by additions without his landlord's consent. He may find unreasonable and antiquated covenants, framed to meet surroundings and circumstances long since passed away, still hamper him at every turn; provisions, for

example, that the house is to be kept as a private dwelling-house only, when beside and around him the houses have been converted into shops, and the house as a private dwelling-house is now altogether unsuitable; provisions he might, perhaps, disregard, but only at the risk of litigation, Troubles are intensified where the lease is granted for lives, not for years. The precariousness of life disconcerts all calculations. Leases for lives are gambling in its worst shape. The matter is one in which the whole community is interested. Everybody is interested in repressing "jerry" building, scamped work, sordid uniformity. No one would object to provisions that on a building estate the regulations framed for the general benefit and enjoyment of the occupiers should still be binding even after enfranchisement. Similar provisions apply to nearly all freehold building estates. Enlarged powers should, if necessary, be given to the local authorities for the protection of property. In places where the leasehold system is unknown, capital cities like Paris and Berlin, such evils do not arise. He would be a bold speculator who would acquire land at its value plus the expense of its enfranchisement, with the view of obtaining illicit profit by injuring adjoining property. Mr. Broadhurst's Bill reached a second reading, but was thrown out by 168 votes against 104—a majority of 64. Such a division should greatly encourage all advocates of change. Why should not a *bonâ-fide* occupier for five years have the right to purchase all superior interests? It is to the public interest that as many people as possible should own the house they live in. The new work created by a reform would be sufficient to justify a special tribunal to deal with those particular questions. Where the lease had over a certain term to run, say thirty-five years, the amount should be ascertained on the rental payable, and the price for the time being of consols. In other cases the value would have to be the market value. If these suggestions should be carried into effect, a great step would indeed be taken to putting an end to that severance of ownership from occupation, so long the reproach of our land laws and a blot on our social system.

Professor Leone Levi, while supporting the views expressed in the papers, said that the real difficulty of the question was in settling the terms and conditions on which the enfranchisement should be effected. This would have to be done by arbitrators or some special and competent tribunal.

Mr. Rowlands and Mr. Sturge expressed the same views, the former stating that from inquiries which he had made he had reason to believe that the evils of the present system were even greater in the provinces than in London. He believed that the agitation in favour of Mr. Broadhurst's Bill would become stronger and stronger. Mr. Hurst, on the other hand, thought that, however desirable the general enfranchisement of leaseholds might be, it was certainly not practicable.

Mr. Granger considered that this question was a mere fringe on the larger question of how to make the land a more marketable commodity. If the proposals advocated by Mr. Broadhurst and Lord R. Churchill could be carried out the community would not be benefited. The unearned increment of land should be enjoyed by the community, and not by individuals; and that view had been adopted by the Birmingham Corporation in their recent improvements.

Mr. J. W. Tonks stated that the compulsory enfranchisement of leaseholders would entail a loss of a million of money on the town of Birmingham.

Mr. Griffiths was opposed to the transfer of the right of one class to another. The real want was a thorough reform of our land laws.

Lord Lymington, in summing up the discussion, said they were all convinced of the importance of increasing the ownership of land, and that view he had always maintained. In fact, so far had he gone in that direction that he had on two occasions in the House of Commons supported a proposal introduced by Mr. Jesse Collings, which would have the effect of enabling the State to lend its credit for the purpose of increasing the number of owners. He had not been convinced of the practical benefit which would result from Mr. Broadhurst's Bill, and he had opposed the Bill in the House of Commons. The question of the unearned increment was only a part of the general question of the reform of the land system. They were desirous that the tenure of land in the large cities should be used for the purpose of and to the advantage of the community, and not solely in the interests of an individual. However, those who were in favour of conferring upon the leaseholder the beneficial right to be a freeholder had not been able to answer the financial difficulties. He was bound to say that Parliament had a very doubtful right to interfere and to override the difficulties of a contract originally entered into. One of the difficulties against the working classes obtaining freehold was the shifting and migratory character of the population. It seemed to him that the direction in which the solution of the question should be approached was that of the municipalisation of the land. He did not see why the Corporations of large towns should not obtain compulsory powers to purchase on fair terms land from individual proprietors.

The Kent Archaeological Society will hold its annual meeting in 1885 at the town of Sandwich.

## LEGAL.

Sheriff's Court, York.—September 19.

RAMSDEN v. ROMANY & Co.

ART PUBLISHING.

The plaintiff in this case is a picture dealer living in Leeds, and the defendants are lithographic publishers of Paris and London. The action was brought to recover damages in reference to three paintings, of which the defendants were to have the loan for a time, in order to prepare from them steel-plate engravings for publication and sale. The agreement entered into referred to three pictures:—*The Thin Red Line*, a scene taken from the Crimean War, and *The Retreat from Moscow*, both by Mr. Gibb, R.S.A., and *The Entomologist*. By this agreement, which was dated August 31, 1882, the defendants covenanted that they would, within two years from that time, execute 3,000 copies of *The Thin Red Line* picture, and that the plaintiff should receive as a royalty 5s. upon each copy so issued. Of *The Retreat from Moscow* 3,000 copies were to be taken, at a royalty of 2s. 6d. each; and of *The Entomologist* a very large number of copies were to be taken at a royalty of 6d. per copy, the whole amount due from the royalties being 1,012l. 10s., to be paid within two years. It was further stipulated by this agreement, which was to extend over a period of fifteen years, that all further copies of the pictures should be paid for at the same rate as before. The defendants, however, repudiated their part of the contract, and did not execute any copies of the pictures, alleging as an excuse that they had so much work on hand from America that they had no time to attend to the pictures of the plaintiff. Recently defendants had entered into liquidation proceedings in Paris, and the petition that they had filed showed that their liabilities were estimated at 14,000l., and their assets at 8,000l., so that the plaintiff will be enabled to obtain only half of the sum due to him. Two years having elapsed since the date of the agreement, the plaintiff now brought this action to recover damages. The defendants had allowed judgment to go against them by default, and the jury had therefore only to assess the damages. They found for the plaintiff for 1,012l. 10s., and also an additional sum of 787l. 10s., being an estimate of the royalties likely to be derived up to the end of the fifteen years, or a verdict altogether of 1,800l.

## CHURCH BUILDING AND RESTORATION.

**English Church in Moscow.**—On the 14th inst. the first religious service was performed in the new English church in Moscow. English visitors who have spent a Sunday in the ancient capital of Russia will remember the old house in the Tchernishvsky Peréoulok, which did double duty, containing as it did the large room employed as a church, and in the other wing the residence of the clergyman in charge. The new edifice is on the site of the old, of which the very foundations were removed to give place to those of its successor. Small as the English community is in Moscow and the neighbourhood, a very short time sufficed to raise the sum of 16,000l. which the building has cost, individual examples of very great liberality helping in this most important part of the undertaking. With only one exception, all the money has been raised among those who worship in the church and their countrymen. The church, a handsome Anglo-Gothic structure in red brick, was built after the designs of Mr. Freeman, of Bolton, who entrusted the actual personal superintendence of the work to Mr. Freidenberg, of Moscow, but paid a visit to Moscow last year, to be assured that all his plans and instructions were being carried out. About 300 people find accommodation in the body of the church; and the building also contains a library, committee-room, and small lodging for the caretaker. The construction of the clergyman's residence, which will be on the same plot of ground, but detached, will be proceeded with next year.

**Rigby.**—The new church on the road leading from Stoke Prior to Finstall has been opened, but for the present the north transept, organ chamber, vestry, and steeple are omitted, although the permanent arches are turned to permit of extension at any future time without involving structural disturbance. The internal length of the church is 91 feet; width of nave, 24 feet 6 inches; width of chancel, 17 feet; height (from floor to wall plate), 15 feet 6 inches; to apex of nave ridge, 33 feet 6 inches. The building is constructed to seat 214 adults and 26 children, and there will be accommodation for 22 men and boys in the choir seats of the chancel. The materials used have been for the walling the local Finstall stone. The interior is lined chiefly with pressed buff bricks, the lower portion of the walls being rendered in Portland cement. The dressings to windows and doorways and the copings are in box-ground Bath stone, the internal dressings being in moulded brick, grey Bromsgrove stone, Finstall stone, and Corsham stone. The roof is open timbered, and plastered and coloured between the rafters. The seating is of red deal, stained and varnished; the bench ends throughout of pitch pine cut to shape and moulded; and the fronts to the choir seats are open framed, pierced, and moulded. Externally the roof is covered with purple tiles, with red ridge crestings. The walling is finished with a rough tooled face. The east gable has a three-light tracery window

filled with stained glass at the cost of Mr. W. Robson. The windows generally are glazed with cathedral tinted glass (the prevailing tone being amber), with floriated pattern work in the tracery. Mr. John Cotton, of Birmingham, is the architect, and Messrs. Brazier & Weaver the contractors.

**Hamilton.**—A free church in Hope Street has just been opened. The design of the building is a free adaptation of ancient Gothic, a striking feature being a handsome spire at the left hand corner of the building. The central doorway is flanked with polished pillars of red granite, with vestibule having staircase on each side leading to the gallery, and two doors leading to the interior of the church, 50 feet long by 42 feet wide, divided by means of light iron pillars into nave and aisles of four bays, each bay being lighted by a two-light window with tracery on the head. There is a gallery at the sides of two seats deep, and a larger gallery at the end extending over the entrance vestibule. A door on each side of the pulpit platform leads to a class-room 30 feet by 18 feet, and a vestry 14 feet by 10 feet, with a staircase to similar apartments below. The fall of the ground at this end of the building admits of this under storey without having to sink below the natural level. Instead of the usual wood lining round the church, which is so liable to rot, the walls are lined to a height of 4 feet with a dado of red pressed bricks, which give warmth of effect and solidity of appearance to the interior. The tower, 17 feet square, rises to a height of 50 feet, and crowned with spire, to a total height of 138 feet. Adjoining the tower is the main gable and aisle of building with central entrance subdivided into two, with foiled circle fanlight in the tympanum to give light to the vestibule. The walls are faced with square ragstone from the Lanark quarries, and with hewn freestone from Wishaw. Messrs. Martin & Symington, Carluke, were the masons; Archibald Millar, Motherwell, the joiner; Thomas Lithgow, slater and plasterer; James Wood, plumber; Robert Symington, painter—all of Lanark; Meikle & Sons, Glasgow, glaziers; Messrs. W. & J. Hay, Liverpool, architects; and Mr. William Cassels, Lanark, clerk of works.

### SCHOOL BUILDINGS.

**Delph.**—On Saturday last the memorial-stones of a new Sunday-school in connection with the Delph Independent chapel were laid. The schools will consist of large schoolroom with platform, infant school, class-rooms, cloak-rooms, and caretaker's house. The style of architecture is a free treatment of late Gothic, the principal feature of the front elevation being a projecting central bay, containing the main entrance, the inscription and memorial-stones. The large schoolroom, standing back from the front portion of the building, will measure internally 52 feet by 29 feet, and will have an open-timbered roof of simple design, the platform being at the further end. The buildings will be faced externally with Yorkshire parpoints, relieved with sandstone dressings, and the roofs will be slated with Welsh slates. Provision has been made for the heating of the rooms with hot water, and great attention has been paid to securing the best means of ventilation. The various rooms on the ground floor are to be laid with patent wood blocking, which is noiseless, and also impervious to damp and dry rot, which is so prevalent in the locality. Mr. A. Banks, architect, Oldham, has prepared the plans, and is superintending the erection of the building, the chief contractor being Mr. C. Winterbottom, Delph. The cost of the new schools will be about 1,500*l*.

### GENERAL.

**The Duke of Westminster** has contributed the sum of 4,000*l*. and a further donation of 100*l*., towards the Chester Museum and Schools of Science and Art, shortly to be commenced on the Grosvenor Road, at Chester.

**A School of Science and Art** is proposed to be erected at Southport, at an estimated cost of 6,000*l*.

**An Art Exhibition** in connection with the Local Arts, Science, and Sanitary Association was opened on Wednesday at Eastbourne by the mayor, Mr. G. A. Wallis.

**A Pulpit** designed by Mr. J. Middleton has been presented to St. Stephen's Church, Cheltenham.

**Mr. Walter Hall**, surveyor and auctioneer, of No. 28 Southampton Buildings, is removing to more extensive offices at No. 38 Chancery Lane, where he will continue to practice as a surveyor and auctioneer.

**The London Corporation** have during the past year expended the following sums:—Guildhall Library and Museum, 4,627*l*.; New Council Chamber, 19,517*l*.; Health Exhibition, 5,000*l*.; Gresham Almshouses, 4,250*l*.; Central Fish Market, 9,393*l*.; Enlargement of Leadenhall Market, 55,234*l*.; City of London School, 19,160*l*.; Thames Outfall Inquiry, 5,000*l*.; Technical Education, 2,000*l*.; School of Music, 4,066*l*.

**A New Font** has been placed in the Earl of Zetland's private chapel at Aske Hall, from designs by Messrs. Clark & Moscrop, architects, of Darlington, and executed by Mr. Ralph Hedley, of Newcastle-upon-Tyne.

**A Collection of Pictures** by Mr. Watts, R.A., is to be exhibited in New York.

**The Committee** of the Leeds Public Library and Museum intend to hold a fine art exhibition, which they expect to be able to open on October 16 next.

**Professor Roger Smith** will open the classes of architecture, construction, and modern practice at University College, London, by a public introductory lecture on the Wall as an Architectural Feature, including the Tower and the Gable. The lecture will take place at the College in Gower Street on Friday, October 3, at 6 P.M. Admission will be free.

**A Baptistry** has been added to the church of St. Andrew, Fort William, from the designs of Mr. Alexander Ross, of Inverness. The windows are by Messrs. Clayton & Bell. The addition is the gift of Mr. G. B. Davy.

**A Pastoral Staff**, which has been designed by Messrs. Bodley & Garner, will be presented to the Bishop of Carlisle on Tuesday.

**The Bishop of Peterborough**, when preaching at the reopening of a church at Duston, told the congregation that churches were not architectural museums merely designed for the recreation and instruction of persons of an archaeological turn of mind, but places designed for worship and the comfort of those who attended them, and whatever interfered with these objects should be removed.

**Mr. A. J. Grahame**, of Balliol College, is to lecture on "English Architecture," in connection with the classes of the London Society for the Extension of University Teaching.

**Mr. J. A. Chatwin**, of Birmingham, is preparing a design for the monument to be erected over the grave of the late Vicar of Edgbaston.

**The French Competition** for a design for a prison on the cellular system has not been successful, and the Société Générale des Prisons have extended the time for receiving fresh designs until March 1, 1885.

**The New Buildings** for the Ecole Centrale des Arts et Métiers in the Carré Saint-Martin, Paris, will be inaugurated on October 15.

**The Friends' Meeting-House**, in York, is to be reconstructed at a cost of about 4,000*l*. The style adopted is French Renaissance of the seventeenth century.

**Herr Hartmann**, of Berlin, has reported on the London Health Exhibition for the Society of Health Technics. While recognising the costliness and magnificence of its productions, he says it is anything rather than a health exhibition, and that from a scientific point of view it is simply pitiful.

**Mr. Frederick Layton** has, according to the *New York Times*, resolved to present an art museum to his fellow townsmen. It is to be designed by Messrs. Audsley, of Liverpool, in the "Thompsonian Greek style."

**The Directors** of the French Protestant Hospice in London have commissioned a Kentish archæologist to transcribe the inscriptions on the tombstones of the French Walloon refugees, who settled in Canterbury three centuries ago, in the various churchyards in Canterbury and the neighbourhood.

**The Bishop of Durham** has appealed for further aid for the Diocesan Church Building Fund. The sum hitherto contributed does not exceed half the amount which it was proposed to raise, and which must be raised, if the reasonable wants of the diocese are to be supplied.

**The Islington Vestrymen** have declined the Marquess of Northampton's offer to place Canonbury Tower in the hands of the parish at a nominal rental. The chief grounds appear to have been that the tower is in need of repair, and that the noble owner was only able to grant a "short and uncertain tenure."

**A Swimming Bath** has been constructed on the premises of the Polytechnic Young Men's Christian Institute at a cost of over 8,000*l*. It is a gift from Mr. Quintin Hogg.

**The Committee** for the proposed district hospital, Newbury, have decided to obtain plans for a hospital of eight beds, allowing 1,200 cubic feet for each patient, with provision for an extension to twelve beds.

**The Gold Medal** of the International Exhibition, Crystal Palace, 1884, has been awarded to the Patent Victoria Stone Company for their artificial stone paving, sinks, steps, and landings exhibited at their stall in the south wing.

**The Highest Award** at the International Forestry Exhibition—the first-class gold medal—has been obtained by Messrs. Robey & Co., of the Globe Works, Lincoln, for excellence in manufacture and design of their engines and machinery.

**A New Theatre** has been erected in Constantine, Algeria, from the designs of M. Paul Gion, at a cost of over 1,200,000 frs. The ceiling has been painted by M. Urbain Bourgeois, of Paris. The statues of *Music* and *Dancing* are by MM. Mabille and Jugrand.

**The Auchmatie Hotel** on the coast of Scotland between Arbroath and Montrose was destroyed by fire on Monday. It was a building of much interest owing to its connection with Scott's novel, "The Antiquary."

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, SEPTEMBER 27, 1884.

### COMPETITIONS OPEN.

**BOMBAY.**—Nov. 6.—The Municipal Commissioner of Bombay invites Designs and Estimates for a New Municipal Hall and Offices, which must be sent to his Office by Twelve noon, on Nov. 6. A Premium of 5,000 rs. will be given for the Design most approved of by the Commissioner, with the assistance of a Committee of the Corporation; 3,000 rs. for the second, and 2,000 rs. for the third. The total cost of the buildings is not to exceed 5 lacs (5,00,000 rs.). Mr. E. C. K. Ollivant, Municipal Commissioner's Office, Bombay, or at Messrs E. W. & R. Oliver, 1 Corbet Court, Gracechurch Street, London.

**EGHAM.**—Oct. 11.—Designs are invited for the Erection of a School to accommodate 320 Children. Mr. Benjamin Tice, Clerk to the School Board, Irene Villa, Egham.

**STOCKPORT.**—Oct. 1.—Designs are invited for Public Baths. Premiums of £50, £30, and £20. Mr. Walter Hyde, Town Clerk Stockport.

### CONTRACTS OPEN.

**BELFAST.**—Oct. 1.—For Building Five Houses, Newtownards Road. Messrs. J. Frazer & Son, C.E., Architects, 117 Victoria Street.

**BIDEFORD.**—Oct. 1.—For Enlarging Chapel. Mr. J. Crocker, Architect, Exeter.

**BISHOP AUCKLAND.**—Sept. 27.—For Building Dwelling-house, West Auckland. Mr. R. R. Rule, Architect, Station View, Bishop Auckland.

**BLYTH.**—Sept. 27.—For Restoration of Church. Mr. C. Hodgson Fowler, Architect, The College, Durham.

**CARLISLE.**—Sept. 30.—For Building Manure Works, Kirkbride Junction. Mr. James Leslie, Architect, 27A English Street, Carlisle.

**COCKERMOUTH.**—Sept. 27.—For Taking Down and Re-erecting Buildings at Globe Hotel. Mr. R. S. Marsh, Surveyor, Cockermouth.

**CONSETT.**—Oct. 1.—For Building County Court Offices, H.M.'s Office of Works, 12 Whitehall Place, S.W.

**CROYDON.**—Sept. 30.—For Additions to Vagrant Wards at Workhouse. Messrs. Berney & Monday, Architects. Messrs. Franklin & Andrews, Surveyors, 25 Ludgate Hill, E.C.

**CUSHENDALL.**—Oct. 1.—For Resetting and Enlarging Parish Church. Rev. W. Thompson, Layde Rectory, Cushendall, co. Down.

**DARLINGTON.**—Sept. 29.—For Building Board School's in Beaumont Street. Mr. F. W. Brooks, Architect, 41 High Row, Darlington.

**DELFH.**—Sept. 30.—For Building Branch Bank for the Manchester and County Bank. Messrs. J. Lawton & Sons, Architects, St Chad's, Uppermill.

**DENTON.**—For Building Four Houses. Messrs. Taylor Bros, Denton.

**DUNDEE.**—For Additions to Glebe Lands School. Mr. David MacLaren, Architect, 81 Murraygate, Dundee.

**DUNFERMLINE.**—Oct. 1.—For Building Double Cottage at Cameron Bridge. Mr. John Houston, Architect, Dunfermline.

**GOSFORTH.**—Sept. 29.—For Building Police Station Mr. John Cresswell, County Architect, Moot Hall, Newcastle-on-Tyne.

**GUILDFORD.**—Sept. 30.—For Building Small House at Sand Tannery. Messrs. Peak, Lunn & Peak, Architects, 3 Market Street, Guildford.

**HAMMERSMITH.**—Oct. 2.—For Rebuilding Superstructure and Strengthening Hammersmith Bridge, Construction of Temporary Bridge, &c. Sir J. W. Bazalgette, Spring Gardens, S.W.

**ILKLEY.**—Sept. 30.—For Construction of Sewers, &c. (1,030 feet), with Works in Connection. Mr. M. Hainsworth, jun., Clerk to the Local Board, Brook Street, Ilkley.

**KEIGHLEY.**—Oct. 1.—For Building Warehouse, Damems. Mr. S. Jackson, Architect, 33 Kirkgate, Bradford.

**KIRKHAM.**—For Building Four Houses and Shops. Mr. Edwin Bush, Architect, 9 Chapel Street, Preston.

**LEEDS.**—Sept. 30.—For Building Warehouse and Premises, Savile Street. Mr. David Drury, Architect, 37 Park Square, Leeds.

**LEEDS.**—For Building Two Houses. Mr. D. Dodgson, Architect, 16 Park Lane, Leeds.

**MARYPORT.**—Oct. 3.—For Building Battery, Drill Shed and Offices. Director of Works Department, Admiralty, 71 Spring Gardens, S.W.

**NEWCASTLE-ON-TYNE.**—Sept. 30.—For Clearing Site and Building Offices for the Tyne Improvement Commissioners. Mr. J. J. Stevenson, 18 Queen's Road, Bayswater, W.

**NEWHAVEN.**—Sept. 23.—For Buildings on new Quay. The Chief Engineer, London Bridge Terminus.

**NORTHCUMBELAND.**—Oct. 6.—For Additions and Alterations to Hoppin and Glorum Farm Buildings, Spindleton Estate. Messrs. Austin & Johnson, Architects, 3 Arcade, Pilgrim Street, Newcastle-on-Tyne.

**OLDHAM.**—Sept. 29.—For Alterations to Albion Mills. Mr. Joseph Stott, Architect, 26 Clegg Street, Oldham.

**ORMSKIRK.**—Oct. 1.—For Building Workhouse School and Premises. Mr. Thomas Kissack, Architect, Albany Buildings, Church Street, Ormskirk.

**OSSETT.**—Oct. 1.—For Enlargement of Methodist Chapel. Messrs. Kirk & Sons, Architects, Dewsbury.

**PONTYPRIDD.**—Sept. 29.—For Building Public Hall, Shops, Offices, and new Roof to Markets. Messrs. James, Seward & Thomas, Architects, St. John's Chambers, Cardiff.

**SALISBURY.**—Sept. 27.—For Rebuilding Cottage at Waterworks. Mr. W. C. Powning, Town Clerk, Salisbury.

**SCARBOROUGH.**—Sept. 29.—For Providing and Fixing Ornamental Wrought-Iron Railing (90 yards), and Gates for Enclosing the Under Cliff. Mr. John Petch, Architect, Scarborough.

**SUNDERLAND.**—Oct. 6.—For Boundary Walls, Iron Pali-sading, &c, for Cemetery Extension. Mr. D. Balfour, C.E., Houghton-le-Spring.

**SWANSEA.**—Sept. 29.—For Construction of Mortuary. Mr. J. Thomas, Town Clerk, Guildhall, Swansea.

**SWINFORD.**—Sept. 30.—For Alterations at Workhouse Infirmary. Mr. W. Hague, Architect, 62 Dawson Street, Dublin.

**UPAVON.**—Sept. 29.—For Building Farmhouse and Stables. Messrs. John Harding & son, Architects, 51 Canal, Salisbury.

**VAUXHALL.**—For Extension to Laundry. Mr. B. Swin-stead, Surveyor, Clacton-on-Sea.

**WEST HARTLEPOOL.**—Sept. 30.—For Erection of Wooden Theatre. Mr. J. Garry, 1 Church Street, West Hartle-pool.

**WIDNES.**—Sept. 29.—For Erection of Public Offices and other Buildings. Messrs. F. & G. Holme, Architects, Dale Street, Liverpool.

### TENDERS.

#### CARLISLE.

For Construction of Drying-closet at the Fusehill Work-house, Carlisle.

Hayton & Son, Manchester	£133	5	0
Bell, Carlisle	110	0	0
Larnmouth, Manchester	86	2	6
Bratford & Co., Manchester	84	0	0

AWARDED SEVEN PRIZES FOR SUPERIORITY, INCLUDING PARIS GRAND MEDAL, 1878, THE CERTIFICATE OF MERIT OF THE SANITARY INSTITUTION OF GREAT BRITAIN, AND THE AWARD OF MERIT AT THE INTERNATIONAL EXHIBITION, 1881.

**TO ARCHITECTS.**—THE BRICK of the FUTURE, that shall not get dingy or sooty like other Bricks, but, being of a **Semi-Vitreous** nature, will maintain a clean and washable surface.

## FACING BRICKS AND BRICK ORNAMENT OF TRUE TERRA-COTTA, AS ALSO ARCHITECTURAL WORK, IN WHITE AND WARM-TINTED BUFF.

Made from the Finest Terra-cotta and Stoneware Clays, of a warm and pleasing appearance, of beautiful and superior quality and finish, non-absorbent, acid fire, and alkali proof, will resist the most severe frosts, and when tested were found to withstand a pressure of 445 tons to the square foot. They have been used in the most exposed parts on the North and South Coasts, and being true Terra-cotta, are warranted imperishable.

Pattern Sheets and Price Lists of superior Glazed Stoneware Sanitary Pipes, and Fire Clay Goods, Chimney Tops, &c., on application.

Sole Manufacturers: **CANDY & CO., Limited**, GREAT WESTERN POTTERIES, NEWTON ABBOT, AND 11 QUEEN VICTORIA STREET, LONDON, E.C. Who are also Sole Makers of the celebrated "Granite Vitrified" Paving Bricks for Yards, Stables, and Footpaths, and "Granite Vitrified" Damp-proof Building Bricks. as used by H.M. Government for dock construction, &c. Samples free to Architects and Engineers.

**BERRY BROW.**

For Taking Down and Rebuilding the Methodist New Connexion Chapel, Berry Brow, near Huddersfield, exclusive of Ironfounder and Heating Apparatus. Mr. J. H. BURTON, Architect, Ashton-under-Lyne.

**GRUNDY'S PATENT  
WARM-AIR  
VENTILATING FIRE GRATE.**

The novelty, superiority, and advantage of this patent  
consist in the heating surface being greater than any  
other Fire-grate introduced to the public. It is very  
simple in construction, and is made in the form of a Stove,  
the back of which is semicircular in shape, with gills  
behind and smoke-nozzle on top, all cast in one piece.  
The same can be attached to any design of a Register or  
Stove front. It is very suitable for schools, class-rooms,  
waiting-rooms, hospitals, offices, dormitories, and dwelling-  
houses, from the cottage to the mansion. Design and  
specification post free on application.

**TESTIMONIALS.**

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"SIR,—I have much pleasure in testifying to the  
efficiency of your patent Warm-Air Fire Grate. It has  
been very successful, and given every satisfaction where I  
have used it.

"Yours, &c.

"JAMES WEIR, F.R.I.B.A.

"To Mr. Grundy."

"Baptist Chapel, Clapham Common, London. Richard  
Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the  
excellency and efficiency of your patent Fire-Grate. It is  
the most charming invention for heating a large room I  
have ever known. I shall have pleasure in showing it to  
anyone who wish to have their schools or rooms pleasantly  
and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,  
July 1884.

"DEAR SIR,—I have very great pleasure in stating that  
the first stove, or patent warm-air ventilating fire grate,  
adopted by me in school at Seaton, and a second in a  
Cocoa Palace, have given such satisfaction that I now  
order eleven to be inserted in New Upper Grade Schools  
in course of erection at West Hartlepool. They are the most  
economical, efficient, and easily managed stove at present  
before the public.

"Mr. John Grundy."

# BELL'S ASBESTOS.

## BELL'S ASBESTOS FLOORING FELT.

This article is manufactured from specially prepared Asbestos fibre, and by its use any building can be rendered comparatively fireproof at a very small cost. This material should be used as a substitute for brown paper under the carpet, and it can be taken up and relaid as often as required; it may be laid between the flooring boards, on the ceiling before plastering, and on the walls. Doors of pine or other wood should be so constructed as to have a sheet of the felt in the centre, so that either side being burned the other remains intact. In houses so protected fires would be localised to the rooms in which they originate. Asbestos felt, being a non-conductor of heat, is superior to any other sheathing, and used under slates has no equal. It yields no dust, lies quite flat, is soft to the tread, and its low cost places it within the reach of everybody. Made in rolls of 36 inches wide.

## BELL'S ASBESTOS BOILER AND PIPE COVERING COMPOSITION.

For coating every class of steam pipe and boiler. Non-combustible, and easily applied when steam is up; adheres to metals and preserves them from rust; prevents the unequal expansion and contraction of boilers exposed to weather; covers 50 per cent more surface than any other coating, and is absolutely indestructible. It can be stripped off after many years' use, mixed up again with 20 per cent. of fresh, and applied again. The composition is supplied dry, and only requires to be mixed with water to the consistency required for use.

A horizontal boiler, 17 ft. 6 in. long, 15 H.P., gave the following results:—

Temperature on Plates .. .. .	186 deg.
"          "          Covering .. .. .	94 "

One ton of coal was saved per week, and, although the fire was raked out every evening 20 lbs. of steam were in the boiler next morning.

The following testimonial refers to this covering:—

Offices of Wimbledon Local Board, Wimbledon, Nov. 28th, 1883.  
Dear Sir.—It may interest you to know that we save exactly 40 per cent. in fuel through using your covering.—Yours truly,  
W. SANTO CRIMP, C.E., F.G.S.

**BELL'S ASBESTOS PAINT**, for floors, stairs, and all interior woodwork, to prevent the spread of fire. This paint is especially useful in cotton mills, and in fact in all factories and buildings exposed to risk from fire. It is quite free from poisonous ingredients, and is both easily and cheaply applied. Bell's Asbestos Paint has, on several occasions, done great service in preventing the loss of life and property. The great fire in Buchanan Street, Glasgow, in November last, produced the following testimony to the value of this material:—

Offices of the *Glasgow Herald*, the *Weekly Herald*, and the *Evening Times*,  
Mr. John Bell, Glasgow, Nov. 14th, 1883.  
Sir.—As one of the means that helped to save our buildings extending from Buchanan Street to Mitchell Street from the recent great fire, I think it fair to say that your Asbestos Paint, which was applied to the outside hoist of the *Evening Times* case-room and other portions, gave valuable proof that it materially aided in resisting the flames from the immediately adjoining tenement while the fire was rapidly destroying it and threatening us in the most serious form. Since the fire, and to assure myself further of the value of the Asbestos Paint as a fire-resister, I placed a piece of wood, with your paint put on more correctly than in our case, into one of our furnaces, with the result that it was brought out without a fibre of the wood being touched, while similar pieces of wood, thrice coated with Irish Lime, at once got into a flame.—Yours truly,  
(Signed) ALEX. SINCLAIR.

**BELL'S ASBESTOS SASH-LINE CORD** is unaffected by heat and damp, and renders unnecessary the use of metallic wire and chains. Ropes made in the same form have great tensile strength, and being indestructible by fire are of incalculable value for fire escapes.

## BELL'S ASBESTOS.

The goods of this house are of the highest quality only, and no attempt is made to compete with other Manufacturers by the supply of inferior materials at low prices. All orders must be sent direct to the undermentioned depots, and not through agents or factors.

## BELL'S ASBESTOS AND INDIA-RUBBER WOVEN TAPE AND SHEETING.

For making every class of steam and water joint. It can be bent by hand to the form required, without puckering, and is especially useful in making joints of manhole and mudhole doors on boilers; also for large "still" joints, where boiling fat and steam have to be resisted. It is kept in stock in rolls of 100 feet, from 1-in. to 3-in. wide, and any thickness from 1/8 in. upwards. Manhole covers can be lifted many times before the renewal of the jointing material is necessary. The same material is made up into sheets about 40 in. square, and each sheet bears the trade mark, without which none is genuine. It is very necessary to guard against imitations of this useful material, and to secure themselves against being supplied with these less useful articles at their price, users are recommended to see that every 10-ft. length of the Asbestos Tape purchased by them bears the trade mark.

**BELL'S ASBESTOS CEMENT** for the backing of firebricks and furnaces. The use of this fireproof material saves the expense and annoyance occasioned by the repairs so constantly required in the firebricks and kitchen ranges of private houses. Any labourer accustomed to handle other cements can apply this.

**BELL'S ASBESTOS BOILER PRESERVATIVE.**—This useful mixture, by absorbing the free oxygen that is in the water, entirely checks pitting and corrosion. It also disintegrates incrustation so immediately as to prevent its adhering to the plates. Not only is a great economy of fuel effected by keeping boilers clean, but the risk of having the plates burned is thereby obviated. It has been computed that 1-16th inch thick of incrustation causes a waste of 15 per cent. of coal; 1/4 inch thick, 60 per cent.; and 1/2 inch, 150 per cent. Thus the Preservative avoids the great risks which are inseparable from scaled plates, lengthens the life of a boiler, and covers its own cost a hundredfold by economy of fuel. It is entirely harmless, and has no injurious action on metals. It can be put into the feed tank or boiler, as may be most convenient. Sold in drums and casks bearing the trade mark, without which none is genuine.

**BELL'S PURE ASBESTOS CLOTH**, for protection against the spread of fire. Iron curtains warp, and in the great emergency of fire will often be immovable. Asbestos cloth, being incorruptible, will remain strong and flexible for an indefinite period, and will stay the progress of a fire and the passage of smoke longer than any other known material. This cloth is also extensively used in Maignen's unequalled water filters, for which a gold medal and diploma of honour were awarded by the Special Commission appointed by Her Majesty's Government to receive the reports of the International Juries at the Fisheries Exhibition. By special arrangement with Mr. Maignen, his filters for houses, factories, and towns are supplied by this firm.

**BELL'S ASBESTOS BLOCK GAS FIRES.**—The Asbestos Block Gas Fire is formed by placing inside the ordinary grate a hollow block (burner), composed of Asbestos, and perforated. An iron sole-plate, with a single gas burner, is fixed at the bottom of the block. After being lighted a short time, both the block and asbestos fuel throw out intense heat.

**BELL'S ASBESTOS FUEL** for gas fires. This genuine Asbestos Fuel is composed of the finest hand-picked Asbestos, and its weight is about half that of any other Asbestos fuel.

**BELL'S SPECIAL LONDON-MADE ASBESTOS MILLBOARD**, for dry steam joints, made of the best Asbestos fibre, is well-known for its toughness and purity, and is absolutely free from the injurious ingredients frequently used to obtain an appearance of finish, regardless of the real utility of the material. Made in sheets measuring about 40 in. square, from 1-64th in. to 1 in. and 1/2 millimetre to 25 millimetres thick. Each sheet bears the Trade Mark.

# The Architect.

## THE CONTRAST BETWEEN CLASSIC AND GOTHIC ARCHITECTURE.

THE exceptional force of the address delivered at the Social Science Congress at Birmingham from the chair of the Department of the Arts would be deemed a sufficient reason, we have no doubt, for our commenting upon it a second time, even if the subject we now desire to take up were not of more than ordinary importance at the moment, namely, the practical contrast between Classic architecture coming into fashion and Gothic going out. Mr. BERESFORD-HOPE, justifying to the full the estimate of his position which we offered last week—the last of the more learned and accomplished representatives of the principle of Gothic art pure and simple—recalls our attention to the “Battle of the Styles” with all his old combativeness, as “a conflict of wonderful persistence, wonderful acrimony, and wonderful interest” not by any means yet ended, in which he has “long consistently and strongly taken his side with the advocates of Gothic,” and, in a word, still maintains his attitude. And so confidently does he carry himself that when he makes mention of the old sentimental arguments that Gothic is the “Christian” style and the “National” style of our country, it is only to lay them aside for the occasion and trust to criticism alone; he is prepared “to make a good one-handed fight” for the style of his predilection by consenting to tie up his better hand and confine himself to the inferior weapon of a purely architectural consideration of artistic and structural composition. In adopting this courageous if not arrogant course, it is not to be expected that an amateur would be able to deal with the subject exhaustively; but we may at once award to Mr. HOPE all the credit of being able to suggest to the mind of the practical professional expert the true lines on which to conduct the inquiry as a critical study on the highest ground.

Classical architecture, says Mr. HOPE, is most characteristically and academically exemplified in the works of the Greeks, such as the Parthenon. It was absolutely and without compromise a style of columns and entablature—post and lintel. The Romans continued this; but with a difference; they introduced the arch. Once admitted into design, this new principle gradually acquired the ascendancy, until, in such an edifice as the Colosseum, the old Greek trabeation or lintel-building was virtually abandoned in favour of the new Roman arcuation or arch-building. He will not go so far as to speak of the Colosseum as a Romanesque design; but, contrasting it with the Parthenon, he seems to be not altogether unwilling to recognise in it the equivalent of Gothic; “the art principles of the two buildings are not *different*, they are *hostile*.” The Romans, appreciating the structural element of the arch at its true value, as “a practical gain which would be feebly described as invaluable,” made it their artistic business “to marry the arch to the ornamentation which they had received from trabeated art.” “In this fight of centuries the arch at last prevailed,” and in the due course of development there appeared “the round arch in Romanesque, the pointed arch in Gothic.” The “victorious arch,” we are left to understand, thus became the one great future principle for the development of all the world’s architectural art; the preliminary lintel-building of the Greeks (and Egyptians) had died out and disappeared for ever; it is useless, therefore, to talk of Neo-Classic, which could only mean revived Greek trabeation; the “Gothic method” has taken permanent possession of the art, and modern Classic is but a pedantic sham. Let us at once observe that this, so far as it goes, is sound criticism, and well worthy of consideration, whether the conclusions are to be right or wrong.

The Flavian Amphitheatre, or Colosseum, as every architectural student ought to know, clearly occupies the position which Mr. HOPE assigns to it. In a certain sense it is the most notable historical building in the world. It exhibits the complete ascendancy of arch-building under the Romans; and in that way represents the close of the Roman style. Out of it

came, so to speak, if not the first arcuated Basilica-building of the Christians, certainly their eventual Romanesque, the Byzantine of the eastern church, and the pointed mediæval or Gothic of the western. There need not be any dispute about this substantially. But this is not all. On the fall of mediæval Christian architecture, and the rise of the modern European or Italian, the Renaissance architects began where the Romans had left off; they began at the Colosseum. In other words, what we call Classic architecture was overthrown as part of the overthrow of the Roman civilisation; it lay in abeyance for more than a thousand years while the Gothic Christian civilisation lasted; and on the fall of this in its turn, and the resuscitation of the dormant but not dead system of the Romans, it naturally revived as part thereof, and calmly resumed its career at the point where it had been suspended.

The Flavian Amphitheatre (as regards of course its external wall design) is to be critically described as a composition in four storeys, each storey in succession, except the topmost one, being structurally a continuous arcade, and superficially an attached colonnade with the structural arches occupying the intercolumniations; the topmost storey also being a superficial attached colonnade, but with the interspaces plain. The peculiarity of the columnar design, which makes it characteristic of the close of the Roman style, is the circumstance that the columns and entablatures are all built up of small stones. The composition so far is a counterfeit, and indeed would not even stand alone. Trabeated or columnar architecture is the architecture of large stones; arcuated is that of small stones. In supreme Classic building, not only the architraves (lintels), but the columns, ought to be monoliths; in supreme Gothic, the smaller the stones the more emphatic the character. The colonnades of the Colosseum, therefore, are designed on the lines of large-stone Classic and built on the principles of small-stone Gothic. That they are “attached,” or merely built into or with the wall by way of surface ornamentation, is incidental to this mode of treatment. The Roman method, therefore, had in the Colosseum reached completion of its kind; that grand Classic feature the “Order” was made superficial and decorative without being embarrassed by substantial considerations, and that invaluable constructive feature the arch was fully utilised without involving the artistic design in that poverty which at the time would have been the inevitable result. This description of the case, we need scarcely say, does not imply either approval or disapproval of the principles developed; Classicists and Gothicists, we hope, will agree that this is the Roman method, and there we leave it.

Turning now to the time when in the course of destiny architectural art amongst the rest was to revert to the Roman method, what do we find? The process of revival took place in Italy as matter of course; no other country was ripe for it; and no sooner were PALLADIO and others able to assume the character of mature Neo-Classic architects that the attached colonnade, with the arcade in the interspaces, all built of small stones, became the typical condition of their method; and, however far the ingenuity of ambitious originators might go in the endeavour to accomplish novelty of composition, this type remained supreme, and the Renaissance in architecture, as we have before put the case, was nothing else than a resumption of the Roman method. We need scarcely go on to say that, from that time to the present, this so-called Classic style has reigned throughout Europe, progressing in various countries in various forms, but always in the same direction. That the method has developed innumerable weaknesses, blemishes, and absurdities cannot be denied; and it may perhaps be admitted by its best friends that in the most pernicious article of sham more especially, modern Classicism—more and more inappropriately so called—has exercised the perverted genius of architects, even of the best, to a degree truly astonishing.

This last remark will remind the reader that it is the boast of the Gothic method that counterfeit design is expressly discountenanced. Mr. HOPE does not forget—nor ought he to forget—to touch proudly upon this fact. The Roman method, reaching its culmination in such buildings as the Flavian Amphitheatre, was a method of counterfeit superficiality; the Renaissance resumed this as a leading principle; the modern European has everywhere maintained and continued it. “Time would fail me,” says Mr. HOPE, “to catalogue all the clumsy contrivances which are necessities in Classical composition, and which, except by extreme blundering, can never occur in Gothic.” We should prefer to speak here of the clumsy con-

trivances as being, not "necessities in Classical composition," but unnecessary practices prevalent in modern Classic; and, as regards the assertion that, except by great blundering, such misadventures "can never occur" in Gothic, we should again prefer to say they need not, and ought not, although they much too frequently do. The fact is that the Gothic method, when in supremely good hands, may produce, no doubt, perfect work, but we all know that in bad hands the application of it is quite as difficult as in the case of Classic. Mr. HOPE knows this as well as any one; he has learnt it by exasperating experience, and his language admits as much. Indeed, he will not pronounce us to be far wrong if we say that sham Gothic is much more odious than sham Classic, for many reasons not easily explained but keenly felt by the critic. Perhaps the chief reason may be that Classic, so called, has here the miserable advantage of recognising the principle—for the sake, as Mr. HOPE says, of "symmetry"—whereas Gothic, being in no such bonds, must in a manner go flagrantly out of its way to seek the counterfeits. But be this as it may.

We are obliged to Mr. BERESFORD-HOPE for so plainly and so courageously reopening just now that always interesting and profitable question the Battle of the Styles, taken in its true critical aspect. Struggling designers of the mediocre class must be permitted to conduct this controversy as a mere strife for ascendancy in business; but more philosophic minds regard it in quite a different light. History furnishes us with two great artistic principles in architecture, strangely inharmonious, but equally sound. It will be a long time yet before we shall cease to find food for reflection in their contrast; indeed, up to the present time there are but very few of us who can appreciate the contrast at all with true artistic philosophy.

#### HOLIDAY PAPERS.—LIMBURG AND THE LAHN.

(Concluded from page 195.)

LIMBURG Cathedral has hardly received as much notice from painters as its singularly solemn and dignified exterior and remarkable situation would seem to irresistibly attract. But at least one interesting etched plate has been made from it. To some, perhaps, the old church presented more charm before the restoration in 1877 swept away the incongruous buildings that had gradually encumbered the base, removed the curious wooden gallery that connected the western towers, restored the shafts and mouldings, stopped with dark mortar and cleaned the weather-worn surfaces. Inside, again, a clean sweep was made of all the heterogeneous ornaments and furniture which gradually accumulate in places of Catholic worship that are not interfered with; details which, though tasteless and discordant in themselves, often produce a highly picturesque effect of colour and chiaro-oscuro and quaint forms. Many an old cathedral and church in Germany has, in the eyes of artists, been ruined for pictorial purposes when the careful restorer had brought it into as near a semblance of its first estate as he could fondly, and most often vainly, devise. Bamberg is a case in point, and Limburg may furnish another. Personally we have nothing to say against the exterior restoration of Limburg, which now holds together as a complete and coherently harmonious example of the Romanesque-Gothic transition at its finest point. The severity and solidity of the early basilica is passing, not abruptly, but by the most beautiful growth, into the richness and elegance of the Pointed style. What an *ensemble* it is with its seven towers, two at the west, two on each transept, and one at the cross on an octagon drum; its lofty aisles, with their distinct roofing; its threefold stages of double triforium and clerestory, each distinct on the exterior, with deeply-recessed openings and elegant shafts, becoming in the upper storey of choir and transepts an arcaded gallery, which in the apse is doubled! Set on the very edge of the precipitous rock that looks not more solemnly grey and enduring than itself, above the smooth river that throws its image back in tremulous reflections, venerable Limburg *Dom* is almost unique for romantic austerity and dignity of effect. It impresses one as a strain of solemn vocal music, a *chorale* of SEBASTIAN BACH, or a *motett* of PALESTRINA.

It is another matter when one enters within, for here, however authentic may be the restorations from a logical point of view, logic in art is again proved a mistake. Nothing can destroy the noble proportions, the height of the narrow nave, the low but wide aisles, the simplicity of the massive square

piers with their soaring shafts clustered in three at each bay, the harmonious gradation of the double triforium arcading, the apse with its deep chapels, the rich treatment of the transept walls, the noble height of the central dome, the pavement of sepulchral slabs. But the removal of the choir screen and stalls into the apse, together with the position of the high altar, replaced at the cross by a low table, and the clearing away of all superfluous furniture, has left the interior very bare. In part to remedy this has been placed beneath the dome the remarkable memorial of the founder of the first basilica, CONRAD KURZIBOLD—a long-throated spare figure, holding his sword with his right hand, and clasping the chain round his throat with the left—lying in a sort of decorated marble coffin, supported by four quaint little images of monks and two beasts. The *Sacramentshaus*, a dainty piece of early Gothic, all pinnacles and figures, in grey stone, spoilt by having been painted over with oil colour, is placed against a pillar in the nave. The famous font, or *Taufstein*, one of the richest and quaintest examples of the model used in the twelfth and thirteenth centuries, is taken from the south transept and placed beneath the north-west tower. It is an eight-sided basin of red sandstone, resting on a four-sided socket, decorated at the angles with the heads of creatures. Eight pillars support the sides; on each stands a grotesque human draped figure, bending askew, as supporter to the rim, round which run rough foliations, different in each division. Two of the grotesque figures are supposed to represent CHRIST and the Baptist; the others to symbolise the vices renounced in baptism.

These ancient things, with the choir screen simply arcaded, and filled in the panels with ancient paintings badly restored, are all that is left of the old church furniture, the pulpit being transferred elsewhere, and the ancient high altar vanished. The objects in goldsmith's work and reliques are of course in the treasury—a certain priceless Byzantine reliquary with enamels, and the enamelled sheath made for a portion of St. PETER's staff are well known to the learned in such art. But the restoration of the Limburg *Dom* interior did not stop at clearance or clearing; it undertook decoration, and consequently, on the evidence of what was left of fresco and tinting, the greater part of the surface has been picked out and covered with polychrome that no claim to correct tradition can make otherwise than crude and jarring. The shafts on the main piers of the nave are coloured grey, with the courses picked out in red. The vault ribs are in checker, blue, red, and yellow, divided by white lines; the capitals are gilt, with red and blue lines on the abacus. Archaic figures of the Apostles, half-length, with mottoes and architectural background, and subordinate figures either side, fill in the tympanums of the lower triforium arches. The dome contains symbolic creatures and archangels; over the triumphal arch is CHRIST the Judge, St. GEORGE, and St. NICOLAS. All the mouldings are picked out; the rough traces of fresco on the transept walls—CHRIST on the Cross, and SAMSON uprooting a tree—have been retouched or over-painted. Elsewhere traces have been too faint to follow, but in the galleries several figures of angels and saints have given sufficient ground for repainting. In the choir and apse fortunately no trace of painting was found. One must use the word fortunately, for without meaning to indict the architect, Herr JUNKER, or the artists, Herren WITKOF, father and son, it must be allowed that the colour scheme of decoration is a failure, and the archaic art of the figure compositions is meagre and repulsive. Painting, even as a wholly subordinate art, was far behind architecture, and the decorative taste of the Romanesque fails directly you come upon the application of coloured ornament. However, again we must repeat that, fortunately, the traces of the old fresco work saved Limburg from, at least, two schemes which would have been yet more fatal to the effect of its austere noble interior. The cathedral is also the parish church here, otherwise things might look more forlorn than they do, and the cathedral be reduced to a mere monument, for the bishopric of Limburg, as may be remembered, was a bone of contention in the late strife between Prussia and the Papacy, and the see is practically vacant. Thus none of the pomp and circumstance and the crowded congregations of the high Catholic ritual give to the stately *Dom* its rightful aspect and full use.

The town of Limburg has suffered from the causes that have affected most of the places hereabouts; but a good deal that is picturesque remains in the frontage or detail of old buildings scattered here and there throughout the irregular

levels—bits of Gothic or later stone ornament, handsome timber work, quaint roofage, and so on. The nobly-spanned and massively-buttressed stone bridge forms a pictorial *ensemble* with the cathedral, the meadows and trees of the opposite bank, and the shining levels of the river, broken up in the foreground by marshy ground full of wild flowers and ridges of waving grass. The place seems little frequented, and student or painter, we can undertake to guarantee, may find comfortable quarters, peaceful leisure, and profitable occupation in old Limburg on the Lahn.

### MR. BERESFORD-HOPE ON SIR GILBERT SCOTT.

[BY A CORRESPONDENT.]

THERE was a time, and not so long ago, when to have incurred the imputation of "Apostacy from True Principles" was, according to certain judges, to place oneself outside the pale of artistic honour. Everyone who aspired to be considered an architect was expected not only to cry out with old JONATHAN OLDBUCK, "Gothic! Gothic! I'll go to the death upon it," but to act up to the words, and to endure the slow martyrdom of the unemployed rather than accept a commission for a building that was to be in any way Classic and corrupt. Some became confessors for a time and recanted when it was too late, a few were faithful to the end; there were others who did change but were ashamed, and felt occasionally touches of sentimental remorse. To amateurs who contemplated architectural work from comfortable arm-chairs in college rooms, or in the dulness of a country parsonage, the Battle of the Styles offered a delightful excitement. Like the worthy Spaniards who implored the Jews and other victims of the Inquisition not to spoil a holiday by showing signs of repentance on the way to the stake, our lay and clerical ecclesiologists persuaded enthusiastic youths that it was more praiseworthy to sacrifice prospects in life than to abide by canons which were not formulated by the Cambridge Camden Society. When the late Sir GILBERT SCOTT agreed to build Government offices in an Italian style, it was like a confession of a captain that his cause was not worth fighting for, and for a time at least the Battle of the Styles was at an end. But the men who had the pleasure of looking on without enduring any of the festering wounds of the field were disappointed at the surrender, and SCOTT had for the remainder of his life to suffer much from their gibes. That his offence has not been forgotten by them is evident from the way in which the offices have been introduced in Mr. BERESFORD-HOPE's address at Birmingham, as if they were the most notorious example in all history of immorality of construction and immorality of composition. After insisting upon the duty of the rigid observance of the double moralities of architectural art, the morality of construction and the morality of composition, the President of the Art Section continued:—

Talking in this connection, I must say that, in my opinion, a more severe blow was dealt to the credit of Gothic architects by the discovery that, with all the pains which the chief of Gothic artists had taken to prove how gracefully he could dance in the fetters of that alien style which official prejudice had forced upon him, he has yet shown himself so strangely unappreciative of the responsibility which rests on every architect to master, and so bestow his personal care upon the sanitation of his building, than by the apparent readiness with which he ever assumed those fetters, &c.

The construction of the sentence is not over clear, arising probably from the indignation of the writer at the time of its composition, but it is evident that Mr. BERESFORD-HOPE considers that the Home and Colonial Offices are as badly drained as they are falsely designed, because they were the work of a man who was an apostate. "The architect who works for truth and not for applause is bound to see that he does not purchase an outside artistic triumph by playing with those issues of life and death which follow on the neglect of nature's sanitary laws," or, in other words, do not follow SCOTT's example. It might be going too far to say that Mr. BERESFORD-HOPE is the last man who has a right to speak in this way, but one thing is certain, that in his reference to SCOTT at Birmingham he displayed an inconsistency that is remarkable. For it must not be forgotten that in 1877, when the defects in the Government

offices were being scrutinised by a Parliamentary Committee, the member who took the part of counsel for Sir GILBERT SCOTT was Mr. BERESFORD-HOPE. It is a counsel's office, knowing his client's own representation of the case, to put questions which shall make it appear in its most favourable aspect. This was done by Mr. BERESFORD-HOPE. We find him asking such questions as the following:—"Did any special instance of tampering with the drainage on the part of an outside authority come under your notice?" "The complaint, which has been very well known and widely spread, and which brought your new building into much discredit, was, you believe, the act neither of yourself nor of the Office of Works, so far as you suppose?" "In the course of your underground investigations did you find any instance of carelessness and stupidity on the part of the people who were actually occupying the building, and which might account for some of this kind of inconvenience?" "You consider that gentlemen of the architectural profession were made the scapegoats for the office?" These questions of themselves suggest the answers given by Sir GILBERT SCOTT to explain what did occur in Parliament Street. We do not profess to know what is the Parliamentary etiquette in cases of the kind, but it can be said with confidence that the humblest barrister would not at one time let it be supposed that his client was a scapegoat, and afterwards declare that he was guilty.

If the offices had been Gothic instead of Classic we should have heard quite as much about the bad drainage. SCOTT was not, after all, so neglectful or so incompetent in his arrangements. By the advice of Captain GALTON the drains were placed in a sub-basement, where they could be always accessible. Any leakage was therefore perceptible, and was duly reported to the Office of Works. The building was occupied before it had been completed, and it is not surprising that occasionally a joint was opened or a pipe was cracked. It was afterwards found that, in consequence of the accumulation of street rubbish in a drain outside the building, the drains from the offices could not act. Government clerks are subject to occasional panics in respect of drainage; and this is excusable if we consider the condition of the houses which have been used as offices. But it is not fair to the architect and builders of the Home and Colonial Office to magnify the shortcomings into crimes. The truth of the case was expressed by one of the members of the Parliamentary Committee when he said:—"If there are any errors or difficulties as regards the construction and detail of the interior of those buildings, they must be shared by those who did not know what they wanted themselves."

### THE STATE AND ART.\*

IN the remarks on the relations between the State and Art in France, which appeared in a late number, we endeavoured to explain that the prominence given to the Prix de Rome was not advantageous to French art. So much attention has to be given to the means by which the medal may be gained, there is little left for other matters. This is what was meant by the late VIOLETT LE DUC, when he said that the gradual disappearance of competent architects in the French provinces is to be attributed in a great measure to the system adopted in the Ecole des Beaux-Arts, by which more pains are taken to present a laureate at the Villa de Medici than to cultivate a body of useful artists. Of late years the school has been enriched by a large staff of lecturers, but the principal education is still to be derived in the *ateliers* in connection with it. They are presided over by renowned artists, but the education of the students is mainly derived through that "atmosphere of floating knowledge" which, according to Sir JOSHUA REYNOLDS, is the best source of artistic education. As the students are the teachers, they are likewise often enabled to foretell who is to be the winner of the Prix, and probably their judgments are the most impartial. But as French artists are mortals, it has happened that deserving students have been sacrificed, and the best work does not always win. An example of this kind is to be found in the popular life of HIPPOLYTE FLANDRIN, the painter. He was a pupil of INGRES, and on that account was once kept out of the final competition by the adherents of

\* "Architecture and Public Buildings: their Relation to School, Academy, and State in Paris and London." By William H. White, Architect. P. S. King & Son.

M. GROS. In the year following he was allowed to compete, and the artists as well as the public proclaimed his work to be the best; everybody told him he was sure of the prize, but FLANDRIN did not believe them, because, as he wrote, "the cabal is horribly active." A contest of principles was carried on over his picture, and he was surprised when he found that he was the winner. Yet afterwards FLANDRIN was one of the fiercest opponents to any reform of the school. What has happened once may be repeated, and hence it is that the prizeman is not always the most promising of the students, and that in the list of French artists names are to be found having "Prix de Rome" attached which do not denote distinguished men.

There is a tacit understanding that the painters and sculptors, after their return from Italy, are to be helped by public commissions. An architect, according to Mr. WHITE, has, among other privileges, "a preferential right to be admitted an assistant at the sittings of the Conseil Général des Bâtimens Civils—a council which advises the French First Commissioner in all matters relating to civil buildings." The Prefect of the Seine, the Prefect of the Police, the Minister of Public Worship, and the Minister of Public Instruction and Fine Arts have also their councils, and among the members are architects who are Academicians and others who have enjoyed the Prix de Rome. The returned prizeman, although he may be thirty years of age, has not necessarily any knowledge of construction; and he is expected, should he be ambitious of employment under the State, to become a subordinate to some architect who has been entrusted with Government works. The Grand Prix, in fact, gives admission to the magic circle in which good commissions fall, and once there a man needs only time and tact to secure his share.

It is not, however, the insuring of a career to several architects that the State has in view. France gains a body of men in every generation who are fitted to conserve those qualities which go to the making of a style. An architect who has studied for two years in Rome and two years in other parts of Italy or in Greece, who has been associated with academicians, may show in his work much of that stiffness which is inherent in everything official; but it is never likely to be freakish or undignified. He knows that his slightest work will be more keenly scrutinised than the larger works of other men, and he is compelled to be careful. A fierce light beats on him, and it is soon discovered whether the State has made a profitable investment in undertaking his education. What becomes of the unsuccessful competitors in the schools is from this point of view of little moment. They may be disheartened, and some may never rise above assistants; but so long as the end is attained of creating a race who will carry on the tradition of art, what matters the repining of the majority? France, like Nature, is careful of the type, careless of the single lives. The travelling studentship of our Royal Academy has some faint resemblance to the Prix de Rome, but the holders obtain no recognition on their return; there are no offices to bring the students together, and thus to obtain the advantages which should arise to the art from uniformity in training among a number of men.

One of those advantages is a belief in the existence of a style, or, in other words, that there is one way of doing work which is better than others. The style may be called academic or old-fashioned or unsuitable, but still it is admitted that there are laws for it which must be recognised, and that experts are the best fitted for the purpose. Hence in Paris when there is a great competition like that for the Opera House, the judges appointed to make the award were, as Mr. WHITE says, "chosen exclusively from the highest ranks of the architects." In England there is nothing sufficiently definite to convince the public in general that there is a style. An ordinary Englishman regards architecture as little more than a collection of odds and ends which can be combined with plain work, and it is of not much importance to him whether there are many or few of them. Of the two, he prefers the few for public buildings. Mr. AYRTON was aware of this national indifference to style, and acted upon it. So long as he was able to say he was cutting down ornament the majority approved of his energy, and had not the slightest misgiving that he was wrong when he spoke of improvement of the designs through his operations. If he had confined his exploits to architecture he might have continued in office. When Mr. WHITE says that a First Commissioner of Works is in reality "a practitioner engaged in building operations

throughout England and Scotland, and he monopolises those architectural works which, in Continental cities, form the prizes of professional eminence," he is helping to make the office popular with the public. The surveyors may have charge of an enormous amount of work, but they are supposed to get it done cheaply, and the public are satisfied. For the same reason the employment of Royal Engineers always finds approval. It is only when a professional architect is entrusted with a public building that there is grumbling. "The prevalent desire for improvements," which Mr. WHITE says he observed, and which was ignored by the authorities, can hardly mean works of architecture. SCOTT, STREET, and BARRY were engaged in a struggle with Government officials on matters which can be termed improvements; but they had all to succumb because they stood without public support.

How long this state of affairs can continue it is impossible to foretell; but until the public are educated to believe in the importance of architecture and are proud of their public buildings, we must expect that Commissioners of Works will think mainly of the objections which can be raised against their administration by advocates of economy. We have heard surveyors complain of the influences by which the features which give character to architecture had to be sacrificed; and generally they existed outside the department. Under those circumstances, what is a First Commissioner to do? Mr. WHITE would say—imitate the example of COLBERT, and form a Council for Buildings, which should meet twice a week at the Minister's house. But there is a difference between the condition of things in England in the nineteenth century and in France in February 1663. The days are gone when an architect's journey was "one scene of triumphant progress, worthy of the ambassador of a great State or a victorious general." That was BERNINI's experience, who was received outside Paris by COLBERT on the part of LOUIS XIV. An architect nowadays is regarded very differently. While, therefore, we are grateful to Mr. WHITE for his skill and courage in representing the condition of English architecture in our time, especially in connection with public works, we believe that he is over-sanguine in supposing that the country is eager for any assimilation with the practice in France. Until the English public is equally well educated in art with the French public, there is an opportunity for Ayrtonism.

## STUDIES OF LONDON CHURCHES.

[BY A CORRESPONDENT.]

(Continued from page 183.)

WHAT an alteration has been made in *St. Sepulchre's Church*, Holborn, by the removal of the galleries a few years since! Other extensive works were also undertaken at the same time. On entering the church the effective feature of the spacious vestibule at the west end well deserves notice, divided off by means of a handsome glazed oak screen from a second vestibule, which occupies about two of the western bays. This in turn is separated from the nave by an oak screen with swing doors. The building has been reseated with open benches, which would be considered too high for a modern church, but are suited to the style of this structure; some of the old oak has been reused. The ends are ornamented with small semicircular panels carried on little shafts, a treatment rather wanting in "breadth," as the eye seems to demand something of a more substantial style. The organ chamber is in an unusual position, opening out from the north aisle a little way from the west end. There is a handsome organ-case gilded; the pipes also gilded. The front is set back from the aisle wall, leaving space for the key-board, &c., and for an elaborate stone screen of Renaissance character, having marble pillars, moulded capitals, and arches. In the centre it is surmounted by a "broken" pediment. This gap contains a floriated cross, of rather too small dimensions; beneath are circular medallions containing heads. One wonders why it was necessary to have such a solid-looking screen to conceal (but in vain) the plain oak impost of an organ-case. An oak screen of simple character would have been more in harmony with the organ-case. The passages of the body of the church are well paved with Godwin's encaustic tiles. But the chancel has a Roman mosaic pavement in an effective and severely-designed pattern. Beautiful as is the material of the revived Mediæval encaustic tile, there is a refinement in mosaic which no tiles can ever reach. The reintroduction of the mosaic was a happy thought. The writer has been informed that the floor of the nave of *St. Sepulchre's* was lowered 18 inches during the late alterations, so as to get a raised floor for the chancel. It is a question whether this is any im-

provement, for the piers of the nave arcade now look rather stilted on their tall pedestals. The fact of the galleries having been removed is almost apparent even to those who never saw the church before the recent works. Is this right? The whole church, somehow, looks too high. Though the sweeping away of the galleries was doubtless a good thing in many ways, it cannot be called an unqualified success. The nave aisle windows have been transformed into the Perpendicular style; but the cathedral glazing is ineffective, as the patterns are too large in scale and monotonous, every window in the north and south aisles being of the same design. To keep out the noise of the traffic, plate-glass has been inserted inside the other glass. It is almost possible to regret the invention of cathedral rolled glass when it is misapplied. What a pleasure to see so much attention bestowed on a City church, considering the ruthless destruction some of them have suffered, and others may suffer unless a strong protest is made. Most of us probably care a little for the verdict of our children and children's children. Yet the finger of scorn will surely be hereafter pointed at those men who, in the nineteenth century, threw to the four winds of Heaven all feelings and scruples as to the sanctity of ground consecrated not only by the successors of the Apostles, but by the thousands of acts of worship which have taken place there. On archæological and architectural grounds, too, by reason of the natural regard for the resting-places of the dead—by all these and other considerations let us turn a deaf ear to excuses for mere "expediency." Some of the advocates for the preservation of City churches have rather uncharitably and sweepingly called the advocates of City church removals men of low commercial instincts and worshippers of Mammon. On the other hand, some of the advocates for demolition have sadly been misled by their mistaken lights, or rather have been blinded by a glamour. Posterity will not view the matter "as through a glass darkly," but perceive the wrong of the case as clear as day, regarding it calmly and judiciously. It should be added (to refer for one moment more to St. Sepulchre's) that two pulpit-like structures have been put up, one at each end of the chancel seats, following the same arrangement as at St. Augustine's, Stepney.

In the spire of *St. Mary Matfelon*, the parish church of Whitechapel, the architect, Mr. E. C. Lee, has not, to the writer's mind, been quite so successful as in the body of the building. The octagonal angle turrets, pyramidal-topped, do not spring out high enough from the base of the spire, and consequently when viewed from a distance the impression is almost given that the spire is broached. The tracery of the spire lights is rather peculiar and the ridge cresting seems superfluous. Why should so infinitesimal a length of ridge, particularly in such a minor detail, be emphasised? The long, deep, louver boards to the belfry windows, cutting into the splays of the jambs, as in continental examples, are not superior, but rather inferior, to the English fashion of setting them further back. There seems, too, no particular advantage or beauty in the small vertical piece at the base of the louver board, unless it be that it prevents the rain being blown in during a gale of wind. On the other hand, the belfry windows of many Mediæval towers in England have unfortunately been deprived, during the dead periods of ecclesiastical architecture, of their pristine louveres. In their place rude boards, pierced with auger holes at intervals, or shallow louveres, resembling Venetian blinds, have been inserted. Nothing can be more detrimental to the appearance of a well-designed tower than such misplaced detail, as the belfry windows ought to be among the most telling features of the composition. The body of this church, rebuilt after the disastrous fire, must be commented upon hereafter.

*St. Saviour's Church*, Shepherd's Bush, was consecrated early in 1880, and is the work of Mr. Blomfield, but scarcely up to his standard. In plan it comprises nave and lean-to aisle on the north, the south aisle being irregular in form owing to the awkward boundary-line of the site on that side. Consequently, the westernmost end of the aisle consists of a twin gable having large windows. The greater part of the remainder of the aisle has a parapet and blank, unpierced wall, as an adjoining wretched little stable prevented any other treatment. There are dormer windows. The roof is carried by posts, so that the south aisle has rather a peculiar effect with so much timber in it, until one walks outside and sees how the architect has got over difficulties and made a comparatively picturesque composition of what in incompetent hands would have been an eyesore. The ready manner of turning blemishes almost into beauties is one of those gifts which marks the true architect, and those who are imbued with the spirit of the inimitable Mediæval men come well through the ordeal. At the north-west angle of the church is an octagonal tower, not yet completed. The chancel also has to be built, and the whole of the east end has a temporary wall. The material employed is the ordinary grey stock bricks, with red bands, and is not plastered internally. There are five arches in the nave arcade, the central three of equal width, the westernmost one not so wide, and the easternmost one narrower still. But the couplet clerestory windows

are not divided out equally, and consequently the windows are set irrespective of the nave arches; piers do not come over piers, or openings over openings. The principals of the roof follow the centres of the windows, so that the strain of the roof in some cases comes over the arches. But as there is the whole height of the clerestory between, the weight probably gets pretty well distributed, and possibly for this reason the architect has put collars to each rafter, planted high up in the construction. Two tie-beams occur to each truss, bolted through and let in on the principal rafter about  $\frac{3}{4}$ -inch; the tie-beam is placed higher than the plate level. The purlines are set vertically, strutted up to the principals by means of curved braces under them. The roof of the north aisle, which is of fair width, is of the same twin tie-beam construction. The principals to this aisle, by-the-by, are made so strong and elaborate as almost to do away with the notion that it is only a lean-to roof.

The very modest, unobtrusive-looking church of *All Saints*, on Putney Common, stands somewhat at a disadvantage on a bare space, with only a slight railing round it and no trees. Architecture can never despise the aid of Nature and the beauties with which she clothes its nakedness. Shrubs, plants, and flowers around a building always much improve the effect. All Saints is built of the ordinary stock bricks, with stone dressings; but it lacks red brick bands, or some other colour to brighten it up. The exterior of the church is in truth plain, almost commonplace. One is, therefore, agreeably surprised by the ornamental appearance of the interior. This is as it should be, and was doubtless the intention of the gifted architect, the late George Edmund Street. The bell-turret is set over the chancel, spire-like and octagonal in form. Gargoyles grin at each angle of the cornice to this turret, but do not form the outlets of any gutters. These representations of uncouth monsters seem scarcely appropriate to a modern church. The ideas of Mediæval Christianity are very charming to a certain extent; but the gaping mouth of hell, as sometimes represented, the buffoonery, or worse, of the carving to the misereres of stalls, and such like, do not seem desirable to revive at the present day. The external plinth to the building is of freestone, consisting of three chamfered stages, a valuable accessory, as it affords considerable dignity to the structure. The dressings of the doors and windows are of chamfered malm bricks. There is no clerestory, but the church has a nave and lean-to aisles of fair width. A space of about one foot occurs between the two roofs, the aisle, as almost invariably happens, being of flatter pitch than the nave. The vigour with which the chimney difficulty (in a church) has been grappled with and successfully surmounted is to be commended. There is a good wide bold projection, on which the chimney wall is carried to some height. If the shaft, instead of the broad chimney-breast, had been lofty and attenuated, the effect would have been very inferior. Turning to the interior, the nave roof has ornamental principals, panelled to the underside of the rafters, with moulded ribs; the panels formed with lath and plaster. The same treatment is adopted in the aisles. The chancel has a brick barrel vault with stone ribs; but the beautiful baptistery at the south-west angle of the nave is groined. There is no particular grace in the brick barrel vault beyond its monumental character. A wood-panelled ceiling is as effective and less costly, and can be decorated in colour whenever required to any extent, leaving the natural surface of the wood as the field, so to speak. With brick this cannot be; it must either be all brick, or brick banded with stone, or otherwise plastered all over. The westernmost bay of the nave has a narrower arch, and is kept free of seats—a very good arrangement, and one it is to be regretted is not more often adopted. The north porch is placed opposite this bay, and there is no west door. The vousoirs to the outer order of the nave, arches, &c., are alternately of red brick and stone, the inner orders being of stone entirely, a leaf happily taken out of the Italian Gothic book. There are stone labels round the arches and large recessed circular panels, also with labels, over each nave pier. The two-light windows to the aisle have a distinct inner order, carried on a detached shaft, occurring opposite the mullion. It need scarcely be said that the walls must be thick in order to carry out such an arrangement properly. The all-important advantage of thick, substantial walls is evidenced here, as well as in the aisle windows. Turning one's attention to the seats, it should be observed how the capping to the seat-backs returned on its own section appears over the bench-ends, a novel treatment which cannot be much admired. The ordinary plan of a bench-end the same height or higher than the seat-backs surely answers very well, thus forming a good stopping. The organ is divided, one portion being considerably bracketed out on the north side of the chancel, the other being on the south side of the south chancel aisle. There is no archway for the organ on the north side towards the church, but only a door from the vestry. The keyboard is placed so that the player sits facing north in the chancel aisle. There is a high iron chancel grille with gates. But one of the most beautiful features in the church has yet to be commented on. Would that there were more such! Instead of a reredos is a painted tryptich. The subject is from the twenty-first chapter of the Apocalypse, the angel with the golden reed showing St. John the heavenly Jerusalem coming down in the clouds—a

mystic theme which, if well treated, must always be very effective. The figure of the angel is exquisite, and the reverent attitude of St. John kneeling, with his hands uplifted, as if in deprecation of the honour accorded to him, is admirable. In the horizon appears the setting sun, while the heavenly Jerusalem is represented according to the beautiful description in the Sacred Word, rich with cupolas and towers. In the panels on either side of the central subject are depicted figures of archangels. A really good piece of painting such as this, religiously conceived, is vastly superior to the ordinary reredos with its hackneyed devices. Not but what a reredos can be very originally designed; but to do this, the architect must not be tied down too closely as respects the funds at his command. The whole of the triptych was designed by the late Mr. Street, the painting being from the pencil of the Mr. Spencer Stanhope. A happy contrivance has been pitched upon in this church for complying with the canon law as respects the Table of Commandments. These are executed in illuminated but legible letters, and enclosed in glazed oak frame of suitable character, surmounted by a cross. There can be no difficulty in finding a place for such a tablet anywhere towards the east end of a church without its occupying too prominent a position. The scale of All Saints is diminished, apparently, owing to its being built, as has been already said, on a wide open space of common, having nothing near to contrast with it. Architects should be careful in endeavouring to counteract to the best of their power such influences when they occur.

The church of *All Hallows*, Lombard Street, was not long since reopened, after the ceiling of the nave had been considerably altered by a top-light filled with white cathedral rolled glass. Probably in order to prevent this looking poor and out of character with the flat painted and carved ceiling, ornamental brass scroll-work has been fixed under it at a distance apparently of about 6 inches from the glass. Surely this metal-work obscures quite as much light as lead quarries would do, and has a too modern appearance, not in harmony with one of Wren's churches. If it be objected that lead is liable to the action of weather and wet, plate glass might have been put on the upper side of the lead lights with proper means for cleaning the space between. The nave ceiling is decorated in blue with gold stars, and circular medallions containing the heads of the four Evangelists. Other details of this church, with its grand reredos, designed by Wren, have been previously commented upon by the writer in the pages of *The Architect*, so it is unnecessary to expatiate further on them.

*St. Crispin*, Bermondsey, is a dignified-looking building of wide span and with a good clerestory, but rather fails in some of its details, as, for example (in the nave), owing to the poor-looking bases, piers, the arches to the windows, and the crude manner in which the shafts carrying the principals of the roof are corbelled out. This is also the case with the chancel arch. The nave roof is open-timbered, having tie-beams carried on bold brackets, commencing some way below the tie-beams, which rest on stone capitals corbelled out as above mentioned, just above the nave arcade. Having rather taken exception to some of the detail, it is pleasing now to turn to the other side of the picture and comment on some of the good features. The course of bricks set vertically at the level of the springing line of the aisle window arches has a good effect—ornamental without being costly. The internal reveal of the window at the west end of the nave is carried down to the floor level, giving space for a coil of hot-water pipes there. The soffit of the tie-beams is fluted and stopped where the bolts occur. This has a good effect, and does not weaken the tie-beams like a chamfer, though taking off any appearance of heaviness. The substantial-looking bracket arches are also a great improvement artistically and constructionally. The gas pendants, though bracketted out from the wall just above the points of the arches, are very well and naturally treated. Consequently, they look better than pendants as ordinarily contrived; in fact almost as well, and at the saving of much expense, as if they were suspended from the ceiling, which is the best way of all. It should be added that *St. Crispin's* is constructed of red brick with stone dressings.

The parish church of *St. Mary Abbots*, Kensington, is so well known that the writer will only make one or two remarks connected with certain details. The panels flanking the central one in the beautiful reredos contain the figures of the four Evangelists in mosaic, with their respective emblems placed before them. This appears to be the best and most sensible mode of representing these mysterious but venerable types, so curiously connected with the ancient prophecy of Ezekiel. It may be modern fastidiousness, but the writer must confess that he does not like to see the emblems in their pristine simplicity unaccompanied by the figures of the Evangelists, especially in a reredos, though he cannot but admire the beautiful Mediæval sculpture of these subjects in the noble abbot's barn at Glastonbury and many other places. The cross in the central panel is of rather an unusual design, being a plain Latin cross as regards its outline, but exquisitely carved with foliage in beautiful flowing lines. This is but another form of the

floriated cross—the glorified representation of that which was once a cross of shame. The only misfortune is that one does not see much of this elegant incised ornamentation at a distance, but only the rather too plain outline of the cross. The labels round the circular panels in the upper portion of the tower might be condemned by a strict architectural purist, on the ground that the label to the lower half of the circle is of no practical use, in fact does more harm than good when there is a hollow member in the label. But these projecting members give variety and shadow to the exterior of a building, and it is possible to strain arguments too far in respect to constructional propriety. The hollows alluded to can never be seen from below, and should be worked solid in the lower half of the circle or vesica, so as to harbour no water. The oak louvre boards, shaped at the lower ends, are superior in effect to slate, and even to stone louveres, as in time they tone down to such a soft silvery grey colour. There is a good contrivance at this church for opening and closing the clerestory windows without having the cords in a too conspicuous and inconvenient position. The cords are carried through the arcade walls and led down the rafters of the aisle roof on to the aisle walls. This is a less expensive way than that adopted at several other churches with clerestories, where a continuous rod with cranks, &c., worked from the corners of the building, on the ground floor, enables even a child to open and close or regulate the casements. Referring to the roof of the nave, much is said by some authorities as to the advisability of tie-rods or beams where there are lofty clerestories, or where the churches are of wide span. No doubt this is the cheapest way of constructing a safe roof. But the result can be attained by other means, as shown in this example.

(To be continued.)

### LABOURERS' COTTAGES IN IRELAND.

AN Act of Parliament was passed in August 1883 with the object of bettering the condition of agricultural labourers in Ireland by providing improved house accommodation for them. By it the local sanitary authority is, after certain formalities are accomplished, enabled to obtain a loan from the Treasury for the purchase of sites and erection of buildings. The money is to be repaid in twenty, twenty-five, thirty, or thirty-five years, and the annual instalments for 100*l.* for those periods vary from 7*l.* 0*s.* 8*d.* to 5*l.* 7*s.* 2*d.* If a cottage should cost 100*l.*, which it must if the expenses of investigation are counted, the local authority will have to pay 5*l.* 7*s.* 2*d.* for thirty-five years. But it is not anticipated that tenants can pay more than a shilling a week, and in consequence the deficit between 2*l.* 12*s.* and 5*l.* 7*s.* 2*d.* must fall upon ratepayers. There will also be a charge for repairs. It is not surprising that the poor law guardians are not enthusiastic in carrying out the provisions of the Act. In two out of the four provinces in Ireland, as there have been no petitions presented, the Act is a dead letter. The Committee who were appointed this year for the purpose of ascertaining whether any amendments to the Act are necessary have not completed their inquiry; but enough was said to suggest the difficulties which attend the least improvement of Irish properties.

The local authority is to take the initiative by asking the Local Government Board to hold an inquiry before an official inspector. After it has been held, the project is to be advertised. Next there is to be an application for a provisional order. Then there is to be an appeal to Parliament for confirmation of the order. All this circumlocution has to be got through before the guardians are in a position to execute the scheme, or, in other words, to tax themselves. Very few and very weary are the victors. It appears that only one union has as yet got as far as the application for a loan, and not one cottage has been commenced in all Ireland.

At the inquiry plans and specifications of the proposed cottages must be exhibited, which may be prepared by an architect or a builder. The Local Government Board desire to interfere as little as possible with the discretion of the sanitary authorities in regard to the designs, but the plans are to comply with the following conditions:—

1. The number of rooms must be sufficient to provide for the due separation of the sexes, and there should be a kitchen and at least two bedrooms in every house.
2. Every habitable room should have a height of not less than eight feet throughout, except in the case of a room constructed in the roof, when one-half of the area of the room should have a clear height of seven feet.
3. Each habitable room should have one or more windows of a total area of glass of at least one-twelfth of the floor space, and all bedrooms should be floored with boards or tiles; the ground floor should be raised not less than nine inches above the level of the external ground.
4. A proper privy should be constructed, in each case separate from the dwelling-house, and distant at least ten feet therefrom; the floor should be flagged or otherwise rendered impervious, and raised at least four inches over the adjoining ground.

It is estimated by the officials that a cottage with the minimum accommodation described in the above conditions will cost from 65*l.*

to 70%. Half an acre of land at 10s. a year would, at twenty-five years' purchase be 12½ 10s., and the difference between 82½ 10s., and 100% represents the cost of employing a surveyor, fees to officers, Parliamentary, and other costs. Seventeen and a half per cent. for fees, or seven years' rental, appears entirely disproportionate when the character of the work is remembered.

There is diversity of opinion as to whether such a cottage as is proposed by the Local Government Board can be carried out for 70%, or for much less than 90%. The simplest way to solve the problem would be to erect a model cottage, but probably a special Act would be necessary for so simple an experiment. According to the official specification the walls are to be of rubble 18 inches thick, the living room is to be floored with concrete, the bedrooms with wood, and the roof is to be of slates. As the cottages are security for the repayment of the loan it is wise to make them substantial, and it is hardly fair to compare the Board's type of cottage with one that has been erected by a private landlord. On the Duke of Devonshire's estate cottages have been built at 105% the pair. The floors in all the rooms are of concrete, but the inspector of the Local Government Board maintains that the material is not adapted for a bedroom floor, and he doubts whether it has any advantage over mud or clay. The objection to concrete arises from its porosity and slowness in drying whenever washed. A civil engineer who has acted for two of the poor-law unions, said that he had erected a brick and stone and slated cottage, containing a kitchen and two bedrooms for 70%; but that if a large number of them were built the cost would be about 65%. The floor of the kitchen would be of flags, and the bedrooms would be boarded. His objection to concrete was the difficulty of getting it properly made, imperfect concrete being dangerous. In Wexford plans have been prepared for cottages to cost 60% 2s. 7d., and if concrete were available it was expected that there would be a reduction of about 5% on that sum. One witness went so far as to say that houses for which the guardians will pay 70% could be erected by a farmer for 35%—but it supposes that labour will be thrown in. It is, however, unwise to be scrutinising the cost of building rather than the legal and official expenses. When it is found that the cost of proving the title for the site of a single cottage can amount to 75%, and for a row of forty-five houses can be 575%, it is evident that an opportunity is offered for law reform.

## THE VENTILATION OF THE HOUSES OF PARLIAMENT.

IN last July the members of the House of Commons were compelled to complain of the prevalence of disagreeable and noxious smells. A Select Committee was appointed, with Mr. W. H. Smith for chairman, to investigate the subject. The evidence has been published as a Parliamentary Paper. Dr. John Percy, who has charge of the arrangements for the ventilation of the Houses of Parliament, was the first witness examined, and he told the Committee that he could not give any information as to the cause of those smells, but he was perfectly certain that they did not arise from any condition within the House. The apparatus employed for the ventilation of the Houses of Parliament, with the exception of some minor improvements, such as the addition of an accessory machine for injecting the air, has been correctly described in the report of 1866. The fans for propulsion of air have been abandoned, and ventilation is now produced by heat applied through coke fires of the simplest construction. In very hot weather a sort of double-acting pump is likewise used for injecting the air, which is drawn from the river front. Some years ago Dr. Angus Smith was commissioned to test the air which passed through the House of Commons on one of the fullest nights, the House being quite crowded. He took samples of the air from different parts of the House; he took some of the air which had passed through the ladies' gallery, and his report was that he could find no sensible difference between its composition and that of the external air. The conclusion to be drawn from the experiment was that the ventilation is so rapid in its effects that there is no contamination of the air by the presence of several hundred people within the building. The air can be changed in every part in ten minutes. It is regulated according to the number of people in the House; and by long experience the assistants are so well trained, they know exactly what the right quantity of air is. Dr. Percy's principle has always been that too much air cannot be given, provided there is no sensible draught; that is a fundamental principle, he believes, in ventilation. It is found that if the velocity of the air does not exceed 1 foot 6 inches per second, then the majority of people will feel no draught. That was determined by Sir Goldsworthy Gurney, and Dr. Percy's experience confirms the accuracy of the statement. At that rate, the thermometer being 60 degs. Fahrenheit, the motion is not sensible, but a good deal depends upon the temperature. The slightest movement of the air in very cold weather becomes very sensible.

As regards the cooling of air, Dr. Percy said that if he had the power of cooling the air to a low degree, he would not take the

responsibility of cooling it very much in hot weather, because then great danger would arise to the members. But the air can be cooled to the extent of several degrees by causing it to pass over blocks of ice in the passage through which the air comes from the river front. It is also more or less cooled by the action of spray jets. That is a little apparatus for the injection of a small stream of water from a high elevation upon a small disc in front. The water seems to become pulverised. It is converted into a fine spray which covers a circle of about nine feet in diameter. In weather when it is necessary to raise the temperature, the air is moistened by steam. But there is great difficulty in producing steam free from odour. At one time leaden pipes laid in open troughs were used; but the steam so produced from the water in the troughs was not quite free from smell, and Dr. Percy had a great deal of difficulty. At last the expedient was adopted of passing the steam through large copper tubes or pipes, and letting small jets of water drop down upon the pipes. In that way steam is generated which is perfectly odourless, and the plan was found so successful it is still adopted. The sewers are ventilated in a simple way. There is a little chimney shaft communicating with the main sewer which passes along near the base of the Clock Tower. At the base of the Clock Tower there is a large fire kept burning, and in front of that fire there is an opening connected with the sewer, up which the sewer gas passes. So satisfactory was the evidence of the officials respecting the ventilation of the Houses of Parliament, it is not surprising the Committee came to the conclusion that the noxious smells did not arise from any deficiency in the sanitary arrangements of the Houses of Parliament. At the same time it was said that it would be impossible for the most perfect system of ventilation to prevent the entrance of offensive smells if they pervade the atmosphere outside the House.

The evidence made it plain that there was a possibility of the sewers in the neighbourhood of the House affecting the air. In spite of what surveyors might say, there were too many witnesses to testify to the malodourness of the atmosphere when some of the flaps were opened. But there was also some other cause more remote, and the Committee if they have not been successful in tracing it, are at least on the track. It was supposed, for example, that the smell was derived from the potteries in Lambeth. Mr. Henry Doulton was, however, able to explain that no smell or odour of any kind emanates from his firm's potteries, with the exception of the salt fumes which arise for a short time when the kilns are at a very high heat. There is no vegetable matter in the clay, and calcined bones are never used. About a year ago Messrs. Doulton felt aggrieved by the unwarranted statements respecting salt glazing, which had been made by members of a deputation to Sir Charles Dilke. They explained their process to Dr. Angus Smith, and he said there had been gross exaggeration. But Messrs. Doulton were eager to remove even the semblance of a nuisance, and, after several experiments, they have been able to reduce the quantity of salt, so that fastidious persons would hardly say there is the least nuisance. Mr. Fletcher, the Chief Inspector of Alkali Works under the Local Government Board, gave evidence to the same effect, comparing the results of experiments in St. Helen's Pottery, and he found that the air at Lambeth now contains only  $\frac{1}{100}$ th part of the quantity of salt which he found in 1873 at St. Helen's. Messrs. Doulton have done much to put down the bone-boiling nuisance in Lambeth, but now the place is made a receptacle for much of the refuse of London.

One of the members of the Committee was Sir Lyon Playfair, and it is remarkable that from his own observations he was able to demonstrate that the offensive odours have been perceptible over a large district of London for more than two years. Sir Lyon's house is in Onslow Square, and during the hot weather of 1884 and 1883 it has been found impossible, owing to that cause, to keep the windows open at night. The odours pass over the district generally between two and three o'clock in the morning, occasionally at seven o'clock at night, and sometimes but rarely on Sunday evenings. The medical officer of health for Kensington has received numerous complaints on the subject. He believes the origin of the smells is to be found in the brick-kilns at Shepherd's Bush and Hammersmith, where the refuse from dustbins is burnt. Sir Lyon Playfair, who has the acute smell of a chemist, says he believes the smells arise from some burning matters, and from the presence of clay, or a combination of impure clay and impure fuel. At Kensington the odour appears to prevail when the wind is from the west, at Onslow Square it is when the wind is from the south-west. The dustyards, where refuse that cannot be sold to brickyards is consumed, and of which there are several within a limited area of the Houses of Parliament, are also considered to be a source of nuisance, although the inhabitants of the neighbourhood make no complaints about them to the sanitary officers. The evidence would thus seem to point to the conclusion that the noxious smells which gave annoyance to many other people, besides Members of Parliament, proceed from dust heaps, refuse of furnaces, or from gases emitted from gas-works, saccharine works and other factories. As it was recommended that an officer of the Local Government Board should be directed to make further observations, it may be assumed that in the next session much more will be heard on the subject,

## NOTES AND COMMENTS.

THERE was regret expressed at the opening meeting of the Sanitary Institute in Dublin on Tuesday, when it was found that Sir ROBERT RAWLINSON was physically incapable of delivering the address which he had prepared. Dr. ALFRED CARPENTER was the reader. The address was probably better adapted to an English than to an Irish audience. The discontent which has prevailed in Ireland has made many of the gentry poor; there are few manufactures and little commerce. Under the circumstances it did not show the tact of an orator to find a Dublin auditory addressed in this way:—"If some of the higher classes did not forego some of the wealth which they had accumulated in order to enable those people of lowly station to lead better lives, they might depend upon it that the lower stratum would find their misery quite sufficient to induce them to endeavour to overturn all above them. It was by no means certain that, if this state of things continued, they might not have a social disturbance like the French Revolution of the last century, which upset society from top to bottom." As Ireland is apparently always ready for mischief, it is not surprising that there were people present who applauded this warning to the rich. But strange thoughts must arise in the minds of landlords, who have been compelled in spite of themselves "to forego some of their wealth," when they read the remarkable utterances of the chief engineering inspector of the Local Government Board.

THE Report which has been prepared by Dr. DUFFIELD, the Medical Officer of Health for Kensington, suggests the growth of the West-end of London. In the beginning of the century the whole of this district, which has an area of 2,245 acres, had but 8,556 inhabitants. At the present time it has more than 170,000. The rateable value sixty years ago was 75,916*l.*, while at the present time it is about a million sterling more. The increase has been the most marked in late years, for in ten years the inhabited houses increased by 4,368, and the population by 42,000. The whole district increased in rateable value by 644,496*l.* in the same ten years. The town sub-district, Kensington parish, has still some open spaces; but some of these are in the hands of the builder, while the Brompton sub-district is now nearly covered, most of the new houses being of an imposing character. The attraction of the district arises from several causes. Kensington is the "old Court suburb"; but more important has been the influence of the Horticultural Gardens, the Albert Hall, and the South Kensington Museum. If the landlords of the district had any gratitude they would long since have erected a memorial of Sir HENRY COLE.

A DECISION has been given by Mr. HOSACK, in the Worship Street Police Court, which will interest the owners of suburban villas. The District Surveyor for East Hackney (North) summoned a gentleman for a fee in respect of a detached greenhouse, 16 feet long and 9 feet wide, which had been erected in a back garden. The magistrate said that he would allow that a greenhouse attached to a building was not exempt, but thought one which was detached, as in this case, was exempt, and therefore dismissed the summons. District surveyors will not approve of this opinion, but from an occupier's point of view it is satisfactory. The small greenhouses which are found in the gardens of London houses are often so simple that they hardly deserve to be called structures. But, like fowl-houses, they have been brought within the terms of the Building Act. We know of a case where the flue in a small greenhouse, entirely constructed by an amateur, was treated by a surveyor as if it were a factory chimney; and many similar cases could be related.

WE lately referred to an action which had been taken by a firm in Greenock against the local Police Board for damages on account of injury to their premises, through the underpinning of a wall by the Board's workmen. It has been settled by the payment of 200*l.* and expenses. But the amount of the latter may be estimated when it is said that the trial lasted four days, the shorthand writer's notes fill two large volumes of 533 pages, the copies of the documents occupy about 300 pages, and the judgments 60 pages. The Greenock ratepayers may with reason demand why such costly proceedings were requisite when the claim was justified, and could be settled for 200*l.*

THE French Société d'Encouragement pour l'Industrie Nationale, founded in 1801, and declared of public utility by a decree of April 21, 1824, has determined to award in 1886 the large medal, bearing the image of JEAN GOUJON, to Architecture and the Fine Arts. A prize of the same kind was awarded in 1880 to M. CHARLES GARNIER, the architect of the Paris Opera House. A prize of 480*l.* is available for the inventor or discoverer of the improvement most useful to French industry, especially for those objects in which France has not obtained superiority over foreign countries.

THE members of the Library Association who visited Dublin were able to see those illuminated books of the gospels by ancient Irish scribes, which belong to the University, of which any country might be proud. The first is the renowned "Book of Kells," dating from the seventh or eighth century. It was preserved in the Columban Monastery of Kells, in Meath. The "Book of Durrow" was once commonly believed to have been written by the hand of St. COLUMBA, who died A.D. 597. But the transcriber, though named COLUMBA, was doubtless not the saint. It had formerly a cover, now lost, on which was an inscription stating that it had been made by FLANN, son of MALACHY, King of Ireland. FLANN died in the year 916. The "Book of Dimma," and the "Book of Moling," are both probably of the seventh century, and are in silver shrines, ornamented with crystals. That of the "Book of Dimma" states that the case was gilt by O'CARROL, Lord of Ely, in the twelfth century, and repaired one hundred years later by a bishop of Killaloe. The "Book of Armagh" was popularly believed to have been written by St. PATRICK's own hand, and the family of MACMOYER derived their name from being its hereditary keepers, in consideration of which they held lands from the See of Armagh. It has been inferred from the half-erased notes in the volume that a part of it was finished in 807. On one page there is an entry in Latin purporting to have been made in the presence of BRIAN BORUMHA, "Imperator Scotorum," which fixes the date of this record at about A.D. 1002. The University Library enjoys the privilege of obtaining a copy of every book published in Great Britain. Modern foreign literature is also well represented, including works on art and archæology. An increase of accommodation is requisite, and the erection of an additional library building is contemplated.

THE Manchester Corporation have obtained a collection of casts from statuary in the Louvre and the Ecole des Beaux-Arts for their art gallery. Under the new regulations the Trustees of the National Gallery are enabled to lend works from the collection in Trafalgar Square, and in consequence TURNER'S *Decline of Carthage and Departure of the Trojan Fleet*, with JOHN MARTIN'S *Destruction of Pompeii* have found their way to Manchester. From South Kensington some of TURNER'S drawings and examples of textile fabrics have been borrowed.

A PARTY of local archæologists lately visited Wirksworth, in Derbyshire. A paper was read by Dr. WEBB proving that lead-mining had been carried on there from time immemorial. The following circumstances suggest that the Wirksworth mines were known to the Saxons:—1. A mine near to Castleton was called Odin, after one of their gods. 2. EADBURGA, Abbess of Repton (to which monastic institution the lead mines at Wirksworth appear to have belonged at this time), sent from Wirksworth, A.D. 714, a leaden coffin in which to bury St. GUTHLAC, Prior of Croyland Abbey, and formerly a monk at Repton. 3. KENEWARA, also Abbess of Repton, gave the estate at Wirksworth, A.D. 835, to HUMBERT, the Alderman, on the condition that he gave lead to the value of three hundred shillings to Archbishop COLENOTH, for the use of Christ's Church, Canterbury. That the mines were worked after the Norman Conquest is proved by a survey, in the possession of the Duchy of Lancaster, of Peveril Castle, made in the reign of Queen ELIZABETH, who greatly encouraged mining operations by inviting skilled workmen from abroad; and this survey describes the castle as being covered with lead. As it was built in the reign of the Conqueror, it is more than probable that the lead used in its construction was obtained from Derbyshire mines; in fact, Domesday Book mentions the working of three lead mines at Wirksworth, one at Crich, one at Ashford, one at Bakewell, and one at Metesford, a manor in the neighbourhood of Matlock.

DESIGN FOR THE ADMIRALTY AND WAR OFFICES.

THE design published this week is by Messrs. HENRY HALL & W. H. POWELL, of Doughty Street.

## A DESIGN BY MICHEL ANGELO.

A LETTER has appeared in the *Times* from Mr. J. C. Robinson, F.S.A., containing the following account of the discovery of a design by Michel Angelo pasted in a book belonging to Sir Andrew Fountaine:—

The particular leaf which has fallen to my share I had noted at the first opening of the volume, in which it was charmingly mixed up with all manner of good, bad, and indifferent "drawings by the old masters." Would anybody else find it out—would some enlightened but hatefully inconvenient curator of a public collection, or some pragmatical dealer, deprive me at the auction of my lawful prey, my discovery? How these cankerous misgivings weighed upon me till the triumphant moment when the much-coveted treasure was knocked down to me, together with two other drawings, for 37s. only! Obviously the treasure had appealed to no one else, yet it was nothing less than an entirely unknown original drawing by Michel Angelo, of singular interest and art value.

This drawing, indeed, shows the grand old Florentine in an entirely new character, that of an ornamental or industrial designer; it is, in fact, a beautiful outline sketch in black chalk for a silver vase or "saliera" (saltcellar); and what is scarcely less remarkable than the fortuitous preservation and recovery of this design is the fact that its purpose, meaning, and exact place in the life's work of Michel Angelo are known. It confirms, indeed, and gives tangible shape to the record of an episode in the career of the artist which has only just been revealed to us. Within the last few years much new matter has been added to the record of Michel Angelo's life and works. The archives of the Buonarrotti family, containing a vast mass of his letters and business papers, have been acquired by the Italian Government and in great part published.

Moreover, diligent search has been made by archivists and art critics in the various Italian State records. Michel Angelo's important works for popes and princes were sure to involve the preservation of voluminous official and other documentary matter, and researches in this field have further added greatly to our knowledge of his personality and works.

Perhaps the most important instalment of fresh information is embodied in Signor Aurelio Gotti's new life of the great artist, and a particular document given *in extenso* therein completely identifies and elucidates the present design. This is a letter now preserved among the papers referring to the Duchy of Urbino, in the State archives of Florence.

It is a business communication from one Geronimo Staccoli, resident agent or Minister in Rome of the Duke of Urbino, Francesco Maria I., to the duke, his master. As this letter speaks for itself, and is, in many respects, interesting, I give a translation of the part of it which relates to the work\* in question:—

"Most illustrious Lord,—In reply to a letter from your Lordship of the 22nd of last month, I beg to say that several months ago was finished the model of the saltcellar in relief, and it is begun to be executed in silver, with paws of animals supporting the vase of the saltcellar, and around this vase are festoons or garlands, also masks, and on the cover is a figure in the round with some more foliage, as Michel Angelo designed it, and as it appears in the finished model, mentioned above.

"Seeing that this has already cost more than eight or ten ducats for the making, and it will come to more still, I would not proceed further without the knowledge and sanction of your Lordship. However, I beg to inform you that there is here sufficient silver to carry the work out; but should six or eight ounces be wanting, I will provide them. For the making of the said saltcellar the artists who formerly served my lord your father demand thirty crowns, and twelve ducats of Portuguese gold for the gilding; but of this gold the value will remain on the piece. They want also a third of an ounce of 'callo' (*sic*) to a pound of silver; but this matters little. Your Lordship is now informed of all that concerns the saltcellar.

"From Rome, the 4th day of July, 1537.

"IERS. STACCOLUS, Servitor."

It is fortunate that the worthy agent gave us a detailed description of the work, for it corresponds in every particular with my drawing, and identifies it as the original design for this saltcellar, without any possibility of doubt. On this point, moreover, whoever is acquainted with the varying phases and methods of ex-

pression of the "mano terribile" will see the unmistakable impress of Michel Angelo in every line and touch of the crayon. A further satisfactory, though unneeded, assurance is in the fact that the drawing is signed with the name of Michel Angelo in an ancient, apparently contemporary, hand.

For the moment, however, we may turn from the drawing itself to the notice of the lost treasure which it prefigured. It is to be feared, alas! that Michel Angelo's saltcellar was long ago transmuted, in all probability melted down and mixed into an endless shuffling of vulgar coin—"Alexander's dust fated to stop a bung-hole." The Duke of Urbino's saliera was one of those troublesome commissions which were from time to time thrust upon Michel Angelo, sorely against his will; it was in reality a stopgap or kind of peace-offering, and marks, in fact, a stage in a woful business, which weighed upon the great artist as the one great trouble of his life. This burden was the famous monument to Pope Julius II., that yawning sepulchre which seemed ever ready to entomb the artist himself.

As we learn from Staccoli's letter, the saltcellar was produced in 1537; but Michel Angelo had undertaken the monument for the Pope so far back as 1506 even. Julius died when little progress had been made with it, and his heirs were these same Della Rovere, Dukes of Urbino. To that family, then, Michel Angelo became accountable for the completion of the work. The artist had received considerable sums of money on account of the tomb, and he himself ardently desired to carry it to completion as the master work of his life, but Julius had interposed all manner of hindrances and obstacles. Four years of Michel Angelo's time had been taken up with the ceiling of the Sistine Chapel alone. When Julius died and Leo X. succeeded, Michel Angelo returned with eagerness to the monument; but no sooner had he settled again to the work than Pope Leo, in his turn, heaped fresh commissions upon him. Julius was the dead lion, and the living Leo cared nothing for his memory. To all the artist's entreaties to be allowed to carry out his contract like an honest man, the new Pope only replied that he himself would arrange matters, and be responsible to the executors of his predecessor. But this undertaking never led the Pope so far as to furnish the means of repayment of the sums advanced to Michel Angelo, by which alone he might have got the burthen off his shoulders. Michel Angelo had done work enough for the money he had received, and it had obviously become impossible for him to carry out the tomb as it had been originally planned. In this conjuncture, nevertheless, the artist was subjected by the duke and his agents to continual threats of legal proceedings, or worse even, while all endeavours to resume the tomb work were immediately put a stop to as soon as discovered by his inexorable taskmaster the Pope. In one phase or other this miserable business dragged itself along nearly forty years. It was not, indeed, till 1545 that the work, after having suffered endless modifications in the sense of constant curtailment and diminution, finally took shape in the single figure of the Moses, with its architectural backing, as it is now to be seen in the Roman Church of San Pietro in Vinculi. Enough, in all conscience, for fifty popes this one immortal statue; yet it must have seemed little better than a standing fraud to the descendants of the fiery Julius.

About 1537 Michel Angelo seems for a time to have got upon a somewhat better footing with the Duke of Urbino, who could not fail to be aware that the artist himself was not to blame for the continued neglect of the tomb undertaking; and the fact now revealed, showing that Michel Angelo went out of his way to design and model with his own hands this saltcellar, is significant evidence of the improved understanding.

Such, then, was the origin of the leaf of paper which has just seen the light. The duke wanted a fine new centrepiece for his table; for in those days the saliera was the one capital standing ornament on every board, and the genius of the mighty master of all time was forthwith pressed into this humble service. That the saltcellar was actually carried out we may safely assume from Staccoli's intimation that, at the time he wrote, the work was, in fact, partly finished in silver. Hundreds of these splendid saliers, unique masterpieces of the greatest artists of the Italian Renaissance, were doubtless made; yet at this moment I can recall only one other extant specimen—Cellini's famous saltcellar, made for Francis I., and now at Vienna.

The hard fact is that the precious metals were far scarcer in olden times than is usually imagined, and it was all but impossible to keep even the most exquisite production of human genius, thus embodied, long out of the melting pot. The chances are, then, that even the world-renowned repute of Michel Angelo himself could not, in the long run, outweigh the few paltry ounces of silver and the twelve Portuguese golden ducats, spread in the shape of gilding over it. Be it as it may, it seems obvious that all memory or tradition of Michel Angelo's saltcellar must have faded away at a comparatively early period. The work may, indeed, have outlived the Dukes of Urbino and their dynasty, but that it should be still extant, hidden away unidentified, can scarcely be hoped for. The story of the Urbino Princes, nevertheless, gives us a clue to search for this lost treasure, and it would be strange, indeed, if it were to be yet unearthed. The Duke of Urbino, Francesco Maria I., died in 1538. All his successors were wealthy princes,

\* Gotti, Vol. ii., Appendix, p. 28. The letter had, however, been published not long before by the editors of the new Italian edition of Vasari.

and the revolutions and plunderings of earlier days had been succeeded in Urbino by unbroken peace and prosperity. When, indeed, in 1631, the dynasty came to an end by failure of male heirs, and the Duchy reverted to the Papal dominions, the allodial possessions and personal property of the last Duke, Francesco Maria II., were regularly transferred to his granddaughter, the wife of Ferdinand II., Grand Duke of Tuscany. All the art treasures and other valuables were removed to Florence, where many of them still ornament the palaces and public galleries, and it seems reasonable to suppose that the saliera had not then been made away with. There is, however, one possible reason why it may have been, and that is from the fatal influence of changing fashion, for by that time single standing saltcellars of great size had become obsolete, and had been replaced by smaller and more numerous receptacles on the modern plan. This, indeed, may have been one of the reasons which induced our own Charles I., about this very time, to alienate the splendid saltcellars of the English Crown plate, incomparable treasures of art as they were. From the previous account it is obvious that, supposing the Urbino saltcellar to be anywhere still extant, it should be sought for in the plate-closets of the ex-Grand Dukes of Tuscany. Perhaps this communication may have the effect of causing search to be made.

It now remains only briefly to describe the details of the work represented in the drawing. The body of the vase is circular in form, the lower part hemispherical, with a deep hollow or cavetto above, the two members being separated by a broad band or fascia, which thus encircles the centre of the piece. This vase is elevated or slung upon three console legs, the lower parts of which, as Staccoli indicates, terminate in animals' paws, in the style of the antique. The piece is thus a kind of tripod or "casolette," and beautiful masks of a satyr with long ears are placed in the centre on each side, where the console legs approach each other in the lower part, and horned masks or animals' skulls are seen in the cavetto above. From these masks proceed hanging garlands, which encircle the vase. The cover is simply ornamented with three dolphins, or plain foliations with dolphins' heads, their projecting beaks hanging over the margin. On a pedestal above stands the "figura de rilievo tutta," as Staccoli describes it, or statuette in the round. This is a beautiful figure of Cupid with outstretched wings poised in a finely-contrasted attitude on one leg, and in the act of shooting an arrow from a bow.

This description, vague and inadequate as all such attempts must be, is but the faintest shadowing forth of an exquisitely graceful composition, admirably proportioned in all its parts, severe and perhaps somewhat too architectural in style, but most characteristic, and unlike any other man's work. To say, indeed, that the composition is eminently Michel Angelesque in every form and motive is to indicate that it embodies the original afflatus of a great genius, which cannot be coldly set forth by words, or scarcely, indeed, rendered comprehensible other than to the sympathetic and receptive few. Needless it is to say that the Cupid is an infant Hercules, for the little figure, two or three inches high only, if magnified would seem an overpowering colossus; and there is a strange, weird expression in the leering masks, as of the grim humour of some jovial Titan, ready, nevertheless, to dash the world to pieces in a changeful moment.

## GLASGOW ARCHITECTURAL ASSOCIATION.

THE first of a series of lectures for the members of the Glasgow Association was delivered on September 23 by Mr. James Thomson, F.R.I.B.A., upon "Other Hindrances to Health in our Houses." Mr. D. Barclay presided. At the outset of his paper, referring to the saying that many articles are manufactured not for use but for sale, which saying has also been applied to buildings, Mr. Thomson, while not entering on the question as to who are parties to blame for unhealthy houses, said that, while well known to the profession, the public appear to be ignorant of the fact that a very large proportion of the dwellings in both England and Scotland are erected without an architect's assistance. The most important point to be considered before building is the site, of which in Glasgow there are many different varieties—solid ground, rock, sand, mud and water, and made-up. The last is especially to be feared, not only on account of the danger to health from escaping gases, but also by its subsidence opening drain pipes under and gas pipes throughout the whole building. The excellent provision in London and Liverpool that no dwellings be erected on made ground containing animal or vegetable matter is an excellent one. Under the head of "plumber work," the various closet and bath-room appliances were considered, and the profuse use of these conveniences, even to the extent of providing such to each bedroom, deprecated as by no means unmixed blessings. Gas also, a convenience taken now as a matter of course, makes us unmindful of its danger. Besides the 10 per cent. leakage of gas, there must be a large portion escaping within the house from corrosion of pipes placed in improper situations, and actual holes caused by careless tradesmen; so, for absolute safety, the lecturer advocated their exclusion from sleeping apartments. The

cause of smoky chimneys was shown to be the wrong situation of the fireplaces in rooms, insufficient area of flue, and stacks parsimoniously reduced instead of being carried well above the highest roof level. With some remarks on modern workmanship, and noticing the Dean of Guild's proposal to appoint inspectors of drains as one deserving the support of the whole profession, the lecturer closed. Mr. Thomson was awarded a hearty vote of thanks for his interesting paper.

## PICTURES WITH CHANGEABLE COLOURS.

THE *Century Magazine* for October contains a sketch by Mr. W. H. Bishop, entitled "Braxton's New Art," which is worthy of Hawthorne. The latter described men who spent their lives in seeking after visionary things. Mr. Bishop imagines an artist who tries to discover colours which, when used on canvas, will vary in accordance with the changes of the year. The following extract describing Mr. Braxton's experiments will suggest the style of the narrative:—

The apartment was of some size, not uncomfortable in aspect, but decidedly *bizarre* for the place. The occupant had an appreciation of colour, if the flowered chintz coverings, including a canopy to the old "four-poster" bed, and the rich barred table-spread were of his providing. There were a couple of tall blue vases, a piece of armour, a carved oak chest, a lay figure, easels, and a pair of Indian clubs, for which his hollowing chest would have been the better had they not been allowed to disappear under an increasing cover of dust.

In one corner were canvases, and charcoal and crayon drawings in large variety, tacked upon the walls. In another were an air-pump, microscope, electric batteries, crucibles, spirit lamps, blow-pipes, and the small furnace. In one corner he would have been certainly pronounced artist, in the other chemist, or even alchemist.

What is his singular occupation? He pulls out an old memorandum-book from a mass of papers among which he is searching, and drops down to inspect it. Let us look on as he reads from one of its pages in a soliloquising way.

"*Mem.—Landscapes with Changeable Colours.*"

"To examine why the vegetation of nature changes from pale and tender greens in spring to full deep greens in summer, and red, yellow, purple, and russet in autumn."

"Is it the action of the atmosphere on a delicate colouring matter contained in the sap?"

"Might not this colouring matter, if so, be extracted without destroying its properties?"

"Might it be possible to combine it with a very sensitive medium or varnish, to paint landscapes still so susceptible to the action of the atmosphere as to change with the seasons, as actual landscapes in nature change?"

"Here it is!" he says. "How little I thought when I put down this entry, as a passing fancy, in university days, that I should ever be actually engaged in trying to carry it into effect! What would the university men think of me now? Ah, well! they have all gone their way, and left me astern. Each to his own method for fame and fortune! If I could but cease thinking of the rewards of success. It paralyses me. Ah, well! this is not work either." And again he resumed his occupations.

It was many years since he had left college. He had established for himself even there the reputation of a person with some curious kinks in his brain. He had since tried business and a learned profession, and failed. He had been left to himself, travelled, and dissipated in his trials a good share of a moderate property that had fallen to him. He was long confident that he should find the right thing at last, but later on was not so confident. He had always had a certain taste for the fine arts, and beautiful shapes and colours gave him intense pleasure. Something turned his attention especially that way at last, and he asked himself, "Why not be an artist? It will give me license at least to be different from others, and who knows but it is my true vocation?"

He went at art thereupon, but was not content with the usual slow and patient steps. The crotchet took him of some highly original stroke. He must regain the distance, rapidly lengthening, between him and the companions of his former life, by some brilliant, new achievement which should lift him far above and beyond the ranks of ordinary men.

Some may recollect, but probably very few, his effort to create a distinctive "American art." This was to be done by idealising modern industrial progress. He endeavoured to glorify and give a sort of personality to machinery. He had in his pictures locomotives, trip-hammers, steam-dredgers, and steam-harvesters; he had pale girls among a tangle of spinning-jennies, and grimy mechanics in dusky boiler-shops. These works were not often admitted to the exhibitions. There were touches of good in them, in a figure or an effect of light, but they were mainly very crude and callow. The public resolutely refused to associate its interest

in the subjects. They were pronounced "barbaric yawps" after the inexpressible.

This ambition overleaped itself. Its author retired into seclusion, growing more and more morose, but eating his heart out with a fiercer determination than ever.

At length came up again this last idea of his, original indeed. He had revived an early whim, and now persuaded himself that it was actually capable of realisation. He had made himself chemist and botanist for its sake, had withdrawn from all other pursuits of his life, left his home, and laboured at it indefatigably for months.

Shall I describe here his processes? Shall I enter upon his confused heaps of memoranda, often written upon random scraps, and little intelligible? Shall I open his large volumes of record, showing the composition of colours, the effect of chemicals upon one another, and of various forces upon them? It would not be an easy task. He was himself far from a methodical person.

He picks up a volume of the writings of an ancient alchemist—not that he has faith in those gentry; he would scorn it in these days of exact scientific research. It is a volume of his *bric-à-brac*, which he bought when not able to contain a certain feeling of likeness once between them and him, in his peculiar pursuit. He falls upon a passage which insists on the necessity of a preliminary ingredient only of the second rank, and absolutely necessary to be found before the great secret itself, the elixir of life, or philosopher's stone, as the case may be, could be discovered. This was called, in mystic parlance, sometimes "the ferment of Luna for the red," and sometimes "the ferment of Luna for the white—having found which you will rejoice."

He set to work to brew, ferment, distill, and extract essences, as of old. He was utilising in his labours plants growing in his windows and a dried collection like a housewife's herbarium. He brought back every day fresh leaves and barks gathered in his walks. He produced vacuums and electric and magnetic currents, generated, combined, and decomposed vapours. He kept his vigil far into the night, then threw himself exhausted on the bed, and dreamed an interminable chemical dream till morning.

## GLASGOW INSTITUTE OF ARCHITECTS.

THE annual excursion of the Glasgow Institute of Architects took place on Thursday in last week. The party, numbering about eighteen, went by rail to Merchiston, and thence drove to Dalmeny Church, where nearly an hour was spent examining this interesting building, which is the most perfect remaining example of Norman work in Scotland. The party drove on to Hopetoun House, the seat of the Earl of Hopetoun, where the collection of paintings and other works of art were examined with great interest. The Forth Bridge works were afterwards visited. Here the party were met by Mr. Arrol, and an hour or two was spent in a careful examination of this undertaking—one of the greatest efforts of modern engineering. On returning to Edinburgh the excursionists dined together in the Windsor Hotel, under the presidency of Mr. James Thomson, F.R.I.B.A., and returned to Glasgow by an evening train. The following gentlemen were present:—Messrs. D. Barclay, J. J. Burnet, Campbell Douglas, W. Landless, W. F. McGibbon, H. H. McClure, J. Mercer, A. Petrie, James Sellers, jun., A. Skirving, D. Thomson, James Thomson, and T. L. Watson. Among the guests present were Messrs. J. A. Campbell, D. Robertson, and G. L. Watson.

## ARCHÆOLOGY IN CHESHIRE.

THE members of the Lancashire and Cheshire Antiquarian Society lately visited Nantwich, Dorfold Hall, Bunbury, and Peckforton.

### Nantwich Church.

This building was described by the Rev. T. W. Norwood. It is mainly fourteenth-century work, with some few additions of the first years of the fifteenth. The nave is a very graceful specimen of early Decorated work. The chief architectural puzzle of the church is the mixture of styles in the western arch supporting the tower, where the concave basement mouldings and the stiff-leaved foliage on the caps are associated with Decorated jamb mouldings, the scroll-moulding abacus, and a continuous series of wave mouldings on the arch. This is a mixture of late Norman forms with Decorated. The chancel is a beautiful work of its kind, of about the same age as the chancel of Bunbury, which is known to have been founded in 1385. It has the same pear-shaped tracery in its Decorated windows, but is more elaborate and ornate than Bunbury. There is a fine stone pulpit in the north-east angle under the octagon tower, and contemporary with it, that is, of transitional age between Decorated and Perpendicular, about 1380. The east and west windows when Pennant figured the church in his journey from Chester to London were of fine Perpendicular character. The eastern remains, but the western has been replaced by a Decorated window, designed by Sir Gilbert Scott,

being the second design of his, as the first after insertion was not found satisfactory. The north and west doors of the nave and the windows of the clerestory are also of Sir Gilbert Scott's work. It would not be proper to praise them. Mr. Chater, who for good reasons was much beloved, swept away much that was interesting from Nantwich Church, in particular the arms of the Earls and Barons of Chester, which were formerly arrayed there on the woodwork of a Jacobean gallery. The most interesting coat of them all—the shield of Malbanc, Baron of Nantwich—has been found, and that is preserved at Wrenbury Parsonage. The transepts have chantries both north and south, of which the northern is now called the lady chapel, and the southern is seen by the square female head dress of Henry IV. age to have been an addition of the early fifteenth century. Besides these chantries there are indications of other altars in the eastern part of the transepts. The occurrence of a fiendish figure hugging a woman with a can occurs several times as a gargoyle on the more eastern exterior of this church, and probably refers to some old story of the town. Nantwich appears to have been alienated by the Abbot of Combermere before the Dissolution. It was much regretted that in the late restoration some of the finest finials of the canopied tabernacle work were stolen and never recovered. There is a library over the church porch, with no books of great value, and on the east side of the porch a little compartment as if for a custodian priest, part of whose duty it may be to celebrate marriages in the church porch, as Chaucer says of the "Wife of Bath:—"Husbondes at the chyrche dor, hadde she had fyve." Externally the finest portion of the church is the chancel. The new red sandstone material has not worn well; it is much peeled and honey-combed under five centuries of weather.

### Dorfold Hall.

This mansion, which is situate about a mile from Nantwich, was next visited. Mr. James Hall read a description:—Dorfold, or, as it was called prior to the eighteenth century, Deerfold, Dorfold, or Darford, the last being an old pronunciation of the word, which local vernacular has corrupted into Darfoot, is the name of an ancient manor in the parish of Acton, about a mile from the town of Nantwich. We may suppose Deerfold to have been originally a clearing in the forest, where the lord's manor house and mill were defended by a pool or moat and a gateway that would warn evil-minded persons that "he that entereth not by the door of the fold, but climbeth up some other way, the same is a thief and a robber." From the time of Henry III. to the end of Elizabeth's reign, a period of about 400 years, Deerfold was held by the families of Wetenhale, Arderne, Davenport, and Bromley, in succession, until it was sold, in or about the year 1602, by William Bromley, brother of the Lord Chancellor Bromley, to Sir Roger Wilbraham, Kt., Solicitor-General of Ireland, Master of Requests to Queen Elizabeth, Surveyor of the Court of Wards to James I., and son of Richard Wilbraham, gentleman, of Nantwich. Sir Roger Wilbraham, who was married and lived in London, shortly after the purchase of Deerfold, handed over the estate as a gift to his youngest brother, Ralph Wilbraham, who held the office of Feodary for the counties of Chester and Flint. Ralph Wilbraham at once set about improving his new possession, and in the year 1616 he had finished building the lofty and handsome residence of brick and stone, now called Dorfold Hall, on the site of the former timber mansion of the Bromleys. The hall is a good specimen of a manor-house of the Transition period of domestic architecture, combining, as it does, some features of house building of a former age, with arrangements suited to the altered circumstances of the times in which it was built. Thus, although it was no longer the custom for servants and retainers to dine together at the lord's table in the common hall, Ralph Wilbraham introduced such an apartment as the central room of his new manor-house, having the usual bay window at one end of the room, and a corresponding bay, as a porch, at the other end; but, at the same time, he found it necessary to provide a greater number of private rooms—bed-chambers and withdrawing rooms—than were usually found in old mansions at that time, consequent upon the altered manners of the gentry during the sixteenth century. In another important particular, the plan of the former house seems to have been reproduced in the new hall, inasmuch as the south front, being open to the park, had no door (although there is one now); while the north and principal front, as in former days, was made to face a quadrangular courtyard; which, according to a drawing in the possession of Mr. Wilbraham Tollemache, was enclosed by a wall on the east and west sides, and on the north by two lodges, as servants' apartments, and a gateway that could only be approached by a bridge across the pool or moat. A good carved staircase, at the west end of the hall, leads to a handsome drawing-room and bed-chamber, both of which are said to have been prepared on two occasions for the reception of royalty; the first time for James I. in 1617, who preferred staying at Townsend House in Nantwich; and a second time in 1882 for the Empress of Austria, who, likewise, did not honour Dorfold with her presence. This bedroom has a screen, and wainscoting of oak of very rich grain; and over the fireplace the royal arms and date 1621. The drawing-room is panelled, and has a coved plaster ceiling of intricate

design with pendants. On the stone chimneypiece is painted the arms and crests of three Knights of the Garter in the time of Queen Elizabeth. These armorial coats have never been refreshed, although they have the appearance of having been recently repainted. In various bedrooms are represented the arms of Delves of Doddington, Crewe impaling Clippesby, Done of Utkinton with several quarterings, and Wilbrahams of Woodhey. In accounting for the presence of these armorial decorations, it may be suggested that they were introduced by way of compliment to notable persons living at the time the hall was built; and not because those persons acquired a temporary interest in the place, as supposed by the editor of the new edition of Ormerod's History. In like manner at Crewe Hall, which was then in course of erection, a similar compliment was paid to the neighbouring country gentlemen, by placing their armorial devices on the staircase of that hall. The hall is in a good state of preservation; but an east wing, quite out of character with the rest of the building, and very ugly but for the mantling of ivy which covers the south front, was added late in last century. Before this addition the east end of the hall was doubtless as picturesque as the west end now is, with its handsome bay window and groups of tall chimneys. The terrace garden has two old stone fountains, probably once belonging to some of the churches in the neighbourhood. The ball ornaments on the terrace wall formerly adorned the gateway of the old District Bank in Nantwich; and the stone gateway leading to the gardens was brought from Townsend House in the same town. The pool is now partially filled up, and the courtyard has low lodge-like buildings of brick and stone, a clock tower, a stone balustrade, and iron gates, all of modern construction, except the two front lodges. In the centre of the quadrangle, on a pedestal, stands a massive group of dogs in bronze, keeping mimic watch and ward over this old memorial pile, which until a few years ago was hidden from view by the tall ancestral trees of Dorfold Park. After leaving Dorfold Hall the party drove to Acton church, and afterwards to Bunbury church.

The plan of the latter, as described by Mr. Norwood, is west tower, nave, and two aisles, a chancel, south chapel, and south porch. The lower part of the tower is handsome Early Decorated work, with a very graceful west window in the façade, of about the same age as the nave of Nantwich. The north drip termination of this window is a lady's head wearing the wimple of Edward II., and the scroll-moulding occurs as a string on the same front. There are two buttresses, rectangular to the wall, of several stages. The upper part of the tower is rather poor Perpendicular. Within the tower, as at Acton, rests on three arches, but all of one character—namely, Early Decorated, with roll and fillet and wave mouldings, as at Nantwich, with which this work is therefore co-eval; the same masons may have carved both. Proceeding eastward, it is seen that the nave, aisles, and clerestory have been rebuilt from the ground, in the last Perpendicular age, as is shown by the Lady Margaret's chevron head-dress in the interior of the north aisle, and by the generally shallow character and mouldings of the whole work, which, though so slight and comparatively poor, is yet spacious, and not inelegant. The chancel is said to have been founded in 1385, by Sir Hugh Calveley, a great knight errant of that time, an adventurous soldier of fortune, conspicuous in the fraternity called the Companions, who, out of love of danger and exploit, fought as chance directed, sometimes for one sovereign, sometimes for another, with a general preference for the King of England. Sir Hugh's monument is set in the midst of the chancel area, a place usually only assigned to kings and very illustrious persons, as in the cases of William Rufus at Winchester, King John at Worcester, and Henry VII. at Westminster. His effigy, of great size, is believed to correspond to his stature. He wears plate armour, with a shirt and gorget of mail. His feet on a lion, his head upon his crested helmet, his arms upon his surcoat, his sword and misericorde dagger by his sides. No Cheshire hero is of greater renown than he. His tomb has survived with very little mutilation. The chancel is of characteristic Late Decorated work, with the convexo plane string in the interior, and pear-shaped tracery in the windows. North of the communion table is a monument of an old admiral of the Beeston family, who is said to have fought against the Spanish Armada. He lies in effigy with his legend, arms, and quarterings. On the north wall, in the place of an Easter sepulchre, is a Decorated founder's tomb, with an ogee canopy. East of the chancel is the chapel of the Egertons of Kidley, with a legend expressing the name and date of the founder; his arms and other ornaments occur upon it. The south porch is Decorated like the west front, near which, in the churchyard, lie many monuments and stones of great interest and curiosity, which are carelessly suffered to perish under exposure to the weather, as if there were no vicar and no rural dean. It is a unique collection of monuments for Cheshire, so far as is known. The stones are thirteen in number, ranging from a rudely-incised coffin stone with an ill-drawn wheel cross, probably early Norman, to two female effigies of the beautiful work of Edward II. style, as the dresses and wimples show. There are a stone coffin and mutilated figures of men in armour of the thirteenth and early fourteenth centuries, but most beautiful are the much-worn Decorated female effigies. Many of these stones are made precious by the legends upon them in large Lombardic letters and Norman-

French inscriptions of the Edwardian time. These monuments, taken together, may be thought to range in time from Early Norman to Late Decorated, and there are incised crosses on some of the coffin stones which belong to the following Perpendicular period. Two of these lie apart near the east end of the church. A clean sweep was made at Bunbury of much that was curious and valuable (so report says) in the late restoration. The interior is now as clean and smart and uninteresting as the restoration men could well make it.

At Beeston Castle, a letter from the owner, Lord Tollemache, to the secretary of the society, was read, in which his lordship said:—You and your friends will be horrified at the kind of lodge I unfortunately erected in connection with the wall I built round for the protection of the building. I hope in a few years, if I live, to pull down the lodge and erect in its place a different kind of building, perhaps a simple cottage of stone. You will, of course, examine as far as you can the well, formerly filled up with ruins by the Parliamentary army, and which I had cleared out many years ago. In that examination you will remark the upper part for a few yards down the shaft is new work, and very distinct from the old work, which was originally constructed in the time of Edward I. I have always understood that when Edward I. determined on the conquest of North Wales, Beeston Castle was the first constructed with the view to carrying out his plan, which was as able as it was successful. After Beeston, Chester Castle was erected, then Flint, then Ruddland, Conway, Beaumaris, and Carnarvon, each station and troop supporting the other. The bulk of the township and manor of Beeston belonged to the family of Beeston, and the other portion, a small one, belonged to the Wilbrahams, from whom I am maternally descended, the eldest daughter of Sir Thomas and Lady Wilbraham, of Woodhey (the head branch of the family having married Tollemache). Woodhey Hall was pulled down by my great grandfather, Lionel Dysart. I, in consequence, purchased that portion of Beeston township which originally belonged to the Beestons, and a portion of the Peckforton Hill from the Mostyns. This enabled me to erect my present residence. Some time after making the purchase, I was offered Beeston Castle and the hill, which really belonged to the Crown, and for which an acknowledgment was paid. I availed myself of that offer. Although I have troubled you with a long letter, I have forgotten to state that, according to the old legend, there was at the bottom of the well a passage leading to an opening outside the hill. The opening of this passage was discovered by the workmen, but I am ashamed to acknowledge that I omitted to give directions for the cleaning of it out. The best way of lighting up the well is to throw lighted newspapers down it, and you will probably observe that some of the embers will rise from the draught below, probably coming from the passage. Owing to the drainage of the land in the neighbourhood, the bottom of the well was simply moist when cleared out. I must add that if you or any of your party wish to see the interior of Peckforton, I beg you will do so. I never purchased a picture, and all now at Peckforton came partly from old Woodhey Hall before it was pulled down, but chiefly from Helmingham Hall. I had always a dislike to a modern castle, but I found owing to the heavy gales, the colour of the stone, &c., a residence on the Peckforton hills could not be in any other style. I took care to have it thoroughly architectural and true. I meant the whole mass to be of stone, and not brick building veneered with stone, every turret with a staircase, and not for appearance. Most of the pictures are by Sir Joshua Reynolds, Gainsborough, Wilson, Morland, &c., &c., and can only be seen with advantage when lighted up on an evening.

This visit concluded the day's proceedings.

#### BOXLEY ABBEY.

A PART of the Kentish estates of Lord Aylesford was sold by auction, on September 25, at Maidstone. There were thirty-three lots in all, including farms, building and accommodation land, wharfage, stone quarries, brick, lime, and cement works, &c., the lots varying in area from building plots to good-sized farms. The principal feature of interest in the sale, as far as the general public is concerned, was, of course, the Boxley Abbey estate, which is situate about two miles from the county town, the remainder of the property offered being in the parishes of Maidstone, Aylesford, Burnham, Snodland, and Rainham. The Abbey estate comprises 905 acres, and has upon it the remains of the old Cistercian Abbey of Boxley. It was at Boxley that the Cistercian monks took up their abode on their first settling in England. The walls date from the beginning of the eleventh century, but the Abbey itself was founded about the middle of the twelfth century by William d'Epres, Earl of Kent. In the reign of Edward I. the Abbot was summoned to Parliament on several occasions. Edward II. took up his residence here during the siege of Leeds Castle, a few miles distant, in October 1221, which siege arose from the refusal of its governor to provide lodgings for Queen Isabella and her suite when going on a pilgrimage to Canterbury.

The Abbey lies in the valley, at the foot of the picturesque

Boxley range, and close by runs the pilgrims' road leading to the shrine of St. Thomas of Canterbury. The old monastic chapel has been converted into a comfortable Elizabethan residence, and the grounds, gardens, and general surroundings, apart from their interest to the antiquary and archaeologist, are very attractive. An old tithe-barn remains in a good state of preservation, and the remains of the Abbey form a picturesque ruin, full of interest. The rental of the Boxley Abbey Estate is at present about 1,000*l.* a year. At the sale Mr. A. W. Dunlop, of Westminster, representing the Earl of Romney, was the purchaser, the price paid being 26,200*l.* Mr. Dunlop also secured for his lordship Little Buckland Farm, Maidstone, having an area of 111 acres, and let to a yearly tenant at 320*l.* per annum, the price given being 12,000*l.*; and also two or three smaller lots. The total sum realised by the sale was over 80,000*l.*

### HEIDELBERG TRANSFORMED.

NOT many of your readers, says a correspondent of the *Scotsman*, may remember Heidelberg thirty years ago. Should those who do revisit it, they will find it wonderfully changed. It is nearly as long since I first saw that venerable University city, and half that time since I last saw it; and now I find it difficult to recognise in the Heidelberg of to-day the Heidelberg of a generation ago. What struck me the most as the train neared the railway station was the large number of tall chimneys. One of the most conspicuous notices before entering the station was one to the effect that a particular building was a "Portland Cement Manufactory." Other large buildings were devoted, as I afterwards learned, to the fabrication of liqueurs which injure the internal organisation, and of soap to cleanse the outer one, as well as of many other things which are useful in their way, but which I did not expect to find amongst the productions of Heidelberg. At other German towns which used to have a rural aspect, the same outcrop of tall chimneys is visible; and, what is worse, clouds of smoke obscure and pollute what used to be a clear and pure atmosphere. This is notable at Cologne and Frankfurt; whilst there is the same visible and unattractive sign that Bonn, like Heidelberg, has become a manufactory of other things than men of learning. I am not about to discuss the question whether large factories are a blessing to civilisation. I have no objection to them; but I may fairly maintain that tall chimneys belching forth smoke spoil a landscape and darken a city. As the Germans are a much more practical people than used to be supposed, and as the police in Germany is as despotic as the police in France, it is strange that nothing should be done to abate the smoke nuisance; for, were that done, the factories would benefit the country without marring its beauties. I cannot better illustrate the change in this particular which has come over Heidelberg than by saying it is as great as would occur if the Links of St. Andrews were covered with factories.

Next to factories, the most conspicuous things in Heidelberg are hotels. In former days, three or four hotels sufficed for the accommodation of visitors. Many of the frequenters were students of the better class, who, if they did not live in them, regularly dined and supped there. These old houses were plain but comfortable; they have been rebuilt, redecorated, or enlarged without becoming more attractive to those who used to know them. They are certainly finer in all respects, and the charges have naturally kept pace with the style. But some of the new hotels overshadow the older ones, and are as grand buildings of their kind as any traveller can desire. They are to be found near the railway station, on the opposite side of the river, where no one ever dreamt of a hotel being built, and beside the castle itself, where one would still less have fancied that a site for a hotel would be chosen. That the opposite side of the river should have become in request for building sites is not surprising. Access to it is now easy by way of a fine new bridge, not far from the railway station, built about seven years ago, whilst the view from that side is by far the finer of the two. The Castle Hotel, perched on a spot close to and slightly higher than the castle itself, is a building which could well be spared. A villa behind it is as great an eyesore. Should building go on near the castle, the citizens of Heidelberg may have reason to regret it. It is easier to spoil than to preserve a fine prospect; and to destroy such a prospect as that presented by the ruined castle and its natural surroundings would be as great an act of vandalism as was the conversion of the majestic castle into a magnificent ruin. In bygone days there was little temptation to live at the castle. The view was worth the toil of ascending there, but the ascent was very steep, and was a hindrance to frequent walks thither. A wealthy and well-meaning Heidelberger recently left his fortune to the city to be employed in its improvement and embellishment, and with this money a new and easy road has been made to the castle, so that the ascent and descent can now be made with ease. For one person who formerly visited the castle ten do so now; indeed, during the tourist season there is a continuous stream of visitors going to and fro from the railway station to the castle. The temptation to build a hotel at the castle was increased by the existence of the new road; and it is not impossible that the road,

which seemed so great an improvement, may help to injure the most romantic part of Heidelberg.

Those who do not remember Heidelberg as it was, will not think its present aspect unpleasing; for, after all, the situation of the city is naturally so fine, that no change can seriously affect it. Lord Cockburn took credit to himself for preventing some changes being made which he thought would ruin the picturesqueness of Edinburgh; yet it is possible that Edinburgh would remain a beautiful and romantic city even if the alterations had been made which he successfully opposed. In like manner, Heidelberg has been the scene of changes which the admirers of its beauty predicted would be fatal to it. Quarter of a century ago the railway stopped here. It was proposed to continue it through the city and along the left bank of the Neckar. It was said that the charming Anlagen, in which some of the best houses stood, would be destroyed if the railway traversed that favourite quarter; yet the Anlagen remains attractive, notwithstanding the railway, which has really proved of great service and done no harm whatsoever. Perhaps, too, the new buildings near the castle, and even the factories near the railway station, may be less injurious to Heidelberg than may at first sight be supposed. It is quite certain that the citizens are growing richer. The new houses are far finer than the old ones; the shops are no longer like those of a country village. The primitive system of supplying the city with water and disposing of its sewage which used to prevail has been superseded by a modern one, which is far better adapted for preserving the health of the inhabitants. Indeed, the promoters of all the changes I have noted may boast of having rendered the city healthier; and to effect such a result no sacrifice, not even that of the picturesque, can be accounted too great. The walks and the views remain as they were. The prospect of the valley of the Neckar and of the long stretch of fertile plains, as seen from the castle terrace, has lost none of its charm, whether seen when the sky is bright and the whole is radiant with sunshine, or when clouds sweep across the sky and the horizon is lurid with an impending storm, or when the sun is rising or setting, or when the moonbeams are lending to the picture a weird yet placid beauty.

The river Neckar has not escaped the improver's hand, but the change made in it is not a conspicuous one. Its outward and visible mark is a line of vessels moving upwards or downwards at intervals, and drawn up-stream by a curious kind of steamer. This steamer has neither paddle-wheel nor screw-propeller. Yet she holds on her course steadily, drawing behind her a large number of heavily-laden barges. No such traffic used formerly to be seen on the river, and, I may add, no such noise used to be heard when vessels were towed up-stream by horses. The truth is, that a system of propulsion, which has been in use for some time on the Elbe and the Rhine, has been applied to the Neckar also. It consists of a chain laid in the bottom of the river, which is wound round a drum on board the steamer, and which enables the steamer to move up stream with its load. The revolving drum on board the steamer makes a considerable amount of noise, but this is not detrimental to the banks of the stream as the revolution of paddle-wheels or screw-propellers would be; so that the rattle of the chain is endured in consideration of the other advantages gained. A little ingenuity might serve to deaden the sound. Certainly no ingenuity is needed to lessen the noise of the steam whistle when one of these steamers passed under the bridge. The din is alike frightful and unnecessary.

### EMPLOYERS' LIABILITY IN SCOTLAND.

AN action was lately taken by a mason against a builder in Glasgow in which damages amounting to 200*l.* were claimed for injuries arising through the fall of scaffolding. The builder maintained that the scaffolding had been erected in the customary way, was of sufficient strength, and that the accident was not due to any negligence on his or his servants' part. Mr. Sheriff Guthrie, who heard the case, found for the defendant, with costs. The following note has been appended to the judgment:—Like many cases of reparation, this is a narrow and difficult one. The cause of the fall of the scaffolding upon which the pursuer was working remains a mystery, and the pursuer founds his claim of damages exclusively upon the fact that the accident occurred, and that the defender has not explained how it occurred, or, to speak more accurately, has not proved that it occurred from causes for which he cannot justly be held liable. It appears to me that this contention is founded on a misconception of the true import of various cases reported in late years, in which the Court sitting as a jury has given effect to the presumption of fault in a defender arising from the mere fact of an accident having happened. *Walker v. Olsen*, 1882, 9 D. 946, *Fraser v. Fraser*, 1882, *ib.* 896, are examples of such cases, of which there have now been a considerable number. It is not for me to say whether there has not been an undue tendency to report cases of this kind, which are truly cases of evidence, which in another country or in other times would have been decided by the verdict of a jury, or whether the expressions reported to have been used by the judges have not been too broad and general.

With regard to the latter point, I do not think that their language can be charged with inaccuracy when it is compared with the older authorities in our own law and in England, or that any new principle or presumption has been introduced other than that which has long been expressed in the brocard *res ipsa loquitur*, and been recognised in such cases as *Macaulay v. Buist*, 1846, 9 D. 245; and *Briggs v. Oliver*, 35 L.J., Ex. 163, and many others. But it is an extremely mischievous and altogether unauthorised assumption that that maxim is applicable to all cases where a defect in plant, machinery, or works belonging to a defender have caused injury to a workman or a stranger to the effect of throwing on the defender the burden of explaining away the accident in a manner consistent with his own innocence. The presumption is to be applied in a reasonable way, and with due regard to the facts of the particular case. The ground of action in all such cases is fault, the proving of which is normally the business of the pursuer, the party who affirms it. This is nowhere more clearly explained than it is by Lord Young in giving the leading judgment in *Grant v. Drysdale*, 1883, 10 R., 1,159, which deserves the more attention because it is for the most part to judgments of the second division that pursuers in this class of cases are accustomed to appeal. In all cases the first question is whether the occurrence of the accident in itself suggests or presumes that the construction of the building or scaffold, the manufacture of the machinery or plant has been defective, or that the defender has been negligent in maintaining or inspecting it. This is itself a jury question, and if it does not receive an affirmative answer as there is no presumption against the defender so there is no shifting of the onus which primarily lies upon the pursuer. In the present case I cannot think that the falling of a scaffolding which is proved to have been erected in the usual way and with ordinary care, and which had borne a much greater strain than was upon it when it fell, creates any presumption against the defender. The accident may have been due to various causes, involving no responsibility of the defender, such as a careless blow from a labourer, or an accidental displacement of a support by a falling stone; and while *Macaulay v. Buist* and other decisions show that a pursuer is not shut up to show the specific defect in such a case of reparation, they are quite in harmony with the leading principle that the circumstances must be such as *prima facie* at least to infer culpability on the part of the defender. I am not satisfied that there must have been fault on the defender's part, or even that it is more reasonable to infer such fault than not, and therefore I assolve the defender. Even if the decision on the main question were different, the pursuer could have recovered a very much smaller sum than he asks. I am not satisfied that the tender of 10% with small debt expenses was not sufficient to discharge any liability that could possibly exist. The pursuer has failed to adduce any evidence that his rib was broken, and he has apparently tried to rear up as heavy a claim against the defender as he could. My only doubt is whether the tender of small debt expenses in such a question as this should be sustained. I have no doubt that the pursuer could in no event have recovered a larger sum than might competently be sued for in the Small-Debt Court, but that is not an absolute test of the propriety of awarding Small-Debt Court costs.

### A PLUMBERS' CONFERENCE.

A MEETING of plumbers was held at the Guildhall, London, on September 26. Mr. Geo. Shaw, Master of the Plumbers' Company, presided, and in his address he said they had met there as representatives of the public as well as plumbers, and they wanted protection for themselves and families against the evils of bad plumbing. The protection of the public and the protection of the interests of the craft and trade of plumbing were virtually synonymous terms. The foundation of the Plumbers' Company rested on this sound basis. The ordinance of Edward III. provided, "That no one of the trade of plumbers shall meddle with works touching such trade except by the assent of the best and most skilled men in the said trade testifying that he knows how well and lawfully to do his work, that so the said trade may not be scandalised or the commonalty damaged and deceived by folks who do not know their trade." The ordinance further provided for good material being used. There was no trade or craft which so directly affected the public health as that of plumbers. The object of the proposed conference would be to give practical expression to the ordinance of the Plumbers' Company. That company comprised among its members men who, like himself, had worked with their own hands in every branch of the plumbing trade, and who had acquired their experience both as men and masters. In addition, the Plumbers' Company had among its members professional men and men whose social position enabled and entitled them to support the credit of the body and advance its usefulness. It was therefore in as good a state of efficiency now as at any previous time in its long history to perform its appropriate and legitimate functions for the fair protection of the public as well as for those who honestly followed the trade and craft of plumbers. The Court of the Plumbers' Company had given careful consideration to the various representations and

applications that had been made to them on the subject of the proposed conference; and it was right that he, as master of the company, should announce that they were willing to give their fullest aid in the advancement of the object. The object of this meeting would be chiefly to consider, first, the scope of the conference (he meant the subject to be considered); second, the date at which it should be held; third, the place of its meeting; and fourth, the organisation by which the needful arrangements might be carried out. He would suggest that there should be a general committee, who should give their influence and support to the object, and a small executive committee of gentlemen who could spare the time to attend to matters of detail. He hoped that when the conference met it would be well attended, so that the subject might be treated as broadly and made known as widely as possible. Opinions were expressed in favour of establishing a set of rules by which the trade could be more satisfactorily carried on. Resolutions were passed requesting the Plumbers' Company to communicate with the National Health Society, the Sanitary Institute of Great Britain, and others, with a view to arrange for a conference of metropolitan and provincial plumbers to be held at the Health Exhibition between October 15 and 20. A committee was appointed, and the following syllabus of subjects to be discussed at the conference was approved:—1. The technical instruction of plumbers. 2. Apprenticeship, the duration and condition of indenture suited to the present state of the plumbing trade, and to the modern system of technical instruction. 3. The establishment of metropolitan and provincial boards of examiners of plumbing work. 4. The registration of journeymen plumbers. 5. The suitability of materials used in plumbing, and particularly of those materials recently introduced as substitutes for lead. 6. The desirability of fixing upon a system by which uniformity in the quality of material used in plumbing may be insured. 7. The formation of district associations of plumbers to investigate and secure, as far as practicable, correction of evils and abuses arising in connection with the trade. 8. A general and executive committee to be formed for the purpose of receiving reports from district associations of plumbers and others, with a view to the preparation of a general report by the Plumbers' Company, to form the basis for an appeal to Parliament for necessary amendments and extensions of the law relating to plumbers' work under the Building and Health Acts and otherwise.

### RAILWAYS IN JAPAN.

THE total length of railways now open in Japan is 240 miles, the first line opened being that between Tokio and Yokohama, which is twenty miles in length, and was opened in 1872. This line, which has five intermediate stations, cost nearly 600,000%, and was constructed by English engineers. The line between Hiogo and Osaka was opened in 1874, but it has since been lengthened at both ends, and now runs from Kobe to Otsu, having a total length of more than sixty miles, and cost 7,000,000 yen. This line, which has sixteen intermediate stations, traverses the wealthiest provinces of the centre of Japan, and among the numerous articles which it conveys to Kobe and Osaka are silk, tea, cotton, rice, wheat, wadding, and cotton goods. It also carries inland the articles imported from abroad, and the native goods sent by sea to Kobe. This line, which stops short at Otsu, begins again at Nagahama, a town upon the opposite shore of Lake Biwa, and runs to the port of Tsuruga, upon the sea of Japan. The distance between the two places is twenty-seven miles. This line was opened for traffic in 1882, so that the whole of this part of Japan can be traversed by railway, except for the break at Lake Biwa, a service of steamers plying between the two termini. A third line has been constructed between Nagahama and Sekigahara and Ohogaki, its total length being fifty-seven miles. The terminus of Ohogaki, to which the line was extended on May 25, is the centre of the province of Mino, which is one of the busiest and most productive in Japan. The fourth line open is that which connects Tokio and Takasaki. The line was not commenced until June 1882, but by July of the following year the trains were already running as far as Kumagai, which is thirty-eight miles from the capital, and the line was completed to Takasaki this spring, when the Emperor opened it in person. The length of this line is about sixty-two miles, and it brings to Tokio large quantities of silk, tea, and tobacco from the different provinces. Two other lines are in course of construction; the first running from Shinagawa, upon the line from Tokio to Yokohama, to Kawagutchi, and the other from Takasaki to Mayebashi, one of the principal centres of the silk trade. The latter, only seven miles long, will be opened this autumn. Five other lines are about to be commenced:—First, from Urawa, upon the Tokio and Takasaki line, to Aomori, a town at the northernmost point of the island of Nippon (length 450 miles); second, from Takasaki to Ohogaki and Yokkaichi (length 200 miles); third, from Onyeda, in the province of Shinano, to Niigata (length 150 miles); fourth, from Osaka to Sakai (seven miles); and fifth, from Shizonoka to Shimidzu, in the province of Tsuruga (seven miles). A tramway from Tokio to Kōfū will also be made without delay.

## LUMBER TRADE OF THE UNITED STATES.

ACCORDING to one of the American journals, the lumber industry will, in all probability, in the course of ten years or so, be transferred from the Northern Lake region to the South. Some idea of the enormous extent of the industry may be gathered from the following figures:—In 1880 there were 25,708 lumbering establishments in the country, employing capital to the extent of 181,000,000 dols., and 146,000 hands, distributing 31,845,000 dols. per annum in wages, using 146,000,000 dols. worth of material, and turning out an annual product of 233,000,000 dols. Michigan ranks first, with a product of 52,449,000 dols.; then comes Pennsylvania, with 22,457,000 dols.; and then Wisconsin, with 17,952,000 dols.; New York, with 14,356,000 dols.; Indiana, with 14,160,000 dols.; Ohio, with 13,864,000 dols.; Minnesota, with 7,366,000 dols.; and Maine, with 7,900,000 dols. Very few of the Southern States reached a product of over 4,000,000 dols.; but then, on the other hand, Michigan is consuming its lumber at a fearful rate. Under the stimulus of a protective tariff, which prevents the importation of Canadian lumber, and offers a premium on the destruction of American forests, the magnificent pineries of Michigan and other States in the lake region are fast disappearing before the axe, and are being sawn into boards for building farmhouses and towns in the prairie regions of the West. But the whole South is a forest region, and, when the Northern lumber supply fails, the great saw-mills will be removed to the Southern forests, and these will become the new centres of the industry.

## The New Law Courts.

SIR,—There was a little skirmish at Birmingham the other day between two of the Presidents of the Social Science Congress as to the relative merits of Classic and Gothic architecture for meeting the social wants of the present day.

I will not attempt to show the fallacy of the idea that style has anything to do with the matter—with deficient lighting, imperfect ventilation, dark and tortuous passages, bad drainage, and so forth. I have a more important object in writing this letter, namely, to ask that a little more justice should be done to the memory of the late architect of the Royal Courts of Justice than, so far as I am aware, has ever yet been given in the criticisms of that building.

Though I am by no means sure of it, I am willing to admit that there are certain inconveniences that might possibly have been avoided; but I should like to ask if there be not others who ought to take their share of blame, instead of allowing all responsibility to rest upon one who has no power to defend himself. As in all other cases, so in the erection of this edifice, there was a building committee of a dozen or so of gentlemen specially trained in the use of the reasoning powers, and, by that fact alone, well qualified to assist the architect. Yet, so far as I have heard, none of these gentlemen have ever come forward to defend their architect, or themselves even, from unreasonable criticism, or to accept their share of responsibility if it was fair. They must have learned at the frequent meetings with him what immense difficulties the architect had to contend with in providing in as satisfactory a manner as possible such large accommodation upon such inadequate space—a problem still further complicated by the difference of levels of the surrounding streets. And yet, sir, not one of the committee have ever thought it necessary to come forward with a vindication or a protest against the criticisms of persons very partially informed of all these difficulties.

I venture to think that the death of Mr. Street just before these violent attacks appeared made it doubly incumbent that some such honourable step should have been taken. Perhaps if they should see this letter they may think it is not too late to dispense a little justice to one who is unable to defend his own cause.

As it is, every opportunity is taken to speak a word of depreciation as to arrangements which, however inconvenient, were probably unavoidable, and for which the architect was certainly not alone responsible.

Faithfully yours,  
EX-ARCHITECT.

**Competition.**—The old Baptist church in Bewick Street, Newcastle-on-Tyne, having been bought by the River Tyne Commissioners, a new site for more extensive buildings, to accommodate an aggregate of 1,500 persons, has been secured. Invitations were recently issued to eight architects, who have submitted plans in competition. The first premium of 50*l.* has been awarded to Mr. J. Cubitt, of London, who will be employed to carry out the works; the second, of 25*l.*, is awarded to Messrs. Clark & Moscrop, of Darlington; and the third, of 15*l.*, to Messrs. Thompson & Dunn, of Newcastle-on-Tyne.

## ENGINEERING WORKS.

**The Sea Defences of Sheerness.**—The great encroachment made by the sea on the shores of Sheerness and the Isle of Sheppey during the past few years is attracting considerable attention, as it is feared that unless something is soon done to put the sea defences in an efficient condition the inhabitants will run the risk of a serious inundation. The Sheerness Local Board of Health and the War Department authorities have recently spent between 30,000*l.* and 40,000*l.* in heightening the wall between Garrison Point Fort and Cheyney Rock; but beyond this point the sea defences are chiefly in private hands, and very little has been done to strengthen them against the alarming encroachments of the tide, which beats on the Sheppey shores with an uninterrupted flow from the North Sea. To meet the difficulty a meeting of the representatives of the War Department, the Ecclesiastical Commissioners, and the trustees of St. Katherine's Hospital, to whom a large portion of the property abutting on the sea belongs, has been held, at which it was decided to apply to the Crown for the appointment of a Commission of Levels, with power to take over the sea defences of the whole of the Isle of Sheppey, and to levy rates upon the occupiers of property, in proportion to the risks they incur, to maintain the same in an efficient condition. In the upper portion of the Isle of Sheppey the sea has made great ravages, large portions of cultivated lands having at times fallen into the sea through the undermining action of the tide combined with land springs. Some years ago it was suggested that convict labour should be utilised in the construction of a wall in front of the cliffs to prevent this continual loss of land, but nothing came of it.

## WORKS IN PROGRESS.

**The American Elevator Company**, of 38 Old Jewry, E.C., have just been awarded the contract for one of their "Standard" hydraulic passenger lifts, to be erected in the private residence of Louisa, Lady Ashburton, at Knightsbridge. This lift will be run in the stair wall, and the car will be made of mahogany, finished both inside and out, and upholstered with leather. The sides will be of glass, so that in ascending and descending the view of the house will be unobstructed. As there will be no ram protruding when the car is ascending, and as the decorations of the car are to be in harmony with those of the house, the presence of the lift in so conspicuous a place will not detract from the ornamentation of the residence.

**Messrs. Archibald Smith & Stevens**, of Queen's Road, Battersea, have just completed two sets of hydraulic lifting machinery, in connection with the Hydraulic Power Company's mains, one at Messrs. Spencer Wickes & Co.'s new premises, Watling Street, E.C.; and the other at Mr. A. Steddall's premises, Addle Hill, E.C.

**Ventilation of Churches.**—Messrs. Robert Boyle & Son, of 64 Holborn Viaduct, and Glasgow, have recently applied their patent self-acting air-pump ventilators and system of ventilation to the following churches:—St. Giles's Church, Soho; Palmerston Road Church, E.; Congregational Church, Burdett Road, E.; New Church, Hornsey Road; Wesleyan Chapel, Gillespie Road, N.; Baptist Chapel, Plymouth; Independent Chapel, Ilfracombe; Congregational Church, Brighton; Wesleyan Chapel, Combmartin, Devon; Christ Church, Mirfield; Mount Zion Chapel, Sheffield; Strood Church, Kent; New Methodist Chapel, Cobridge, Burslem; Carr's Lane Chapel, Birmingham; Greystones Parish Church, county Wicklow; St. Paul's Church, Bedford. Messrs. Boyle have also just completed the ventilation of St. Matthias Church, Earl's Court, for Mr. Arthur W. Blomfield, architect, for whom they have also recently ventilated the chapel of Emmanuel College, Cambridge; St. John's Church, St. Leonards; and St. Michael's Church, Paddington. Plans have also been furnished for the ventilation of St. Mary Redcliffe, Bristol. Messrs. Boyle have received the following valuable testimonial from Mr. Blomfield:—"I have used the air-pump ventilators of Messrs. Robert Boyle & Son, with satisfactory results. I believe the system to be a sound and good one, and capable of varied application with success. (Signed) ARTHUR W. BLOMFIELD."

## CHURCH BUILDING AND RESTORATION.

**Clitheroe.**—A Lady Chapel, which has been constructed on the right-hand side of the principal altar, has just been opened at the Clitheroe Catholic church. It is elaborately designed, but in the main features it harmonises with the architecture of the church. The floor is formed of mosaic work, marble, and alabaster, and the pillars, arches, &c., of the chapel are of marble. Mr. S. J. Nicholl, of London, is the architect, and the work has been done by Mr. Anstey. On the right-hand side of the entrance there is an alabaster statue of the Blessed Virgin, and within the chapel there are three paintings by Mr. Joseph Bouvier, portraying incidents of her life. The first one, on the background beneath the altar, represents the tomb of Our Lady and the ten apostles showing St.

Thomas where her body had been laid, and the flowers in the empty tomb. Behind the altar is a picture of the Assumption, and higher still there is the representation of the Coronation.

**Leicester.**—The Charles Street chapel has been reopened after undergoing renovation. Additional ventilation has also been provided, and the heating apparatus has been put in good working order. The whole of the interior work has been executed in pitch pine. Messrs. Redfern & Sawday, A.R.I.B.A., of New Street, Leicester, were the architects for the work, and Messrs. Sharp & Sons, of Queen Street, the contractors.

**Richmond.**—A Congregational church has been opened at Richmond. The buildings comprise church and chancel, recess for organ, with present accommodation for 250 persons; deacons and minister's vestries, school for 150 children, lobbies, and the usual outbuildings. Mr. W. Shaw, of Richmond, is the contractor for mason and plasterer's work; Mr. H. Harwood, of Manfield, for joiner's work; Messrs. R. Spence & Co., of Richmond, for iron-work and heating; Mr. J. Wanless, of Darlington, for slater's work; Mr. C. Fryer, of Richmond, for plumbing, &c.; Mr. Stevenson for painter's work. The architects are Messrs. Clark & Moscrop, of Feethams, Darlington.

### NEW BUILDINGS.

**Conservatory Building.**—The Mayor of Bradford has just added a spacious conservatory to his residence at Daisy Hill, Bradford. The conservatory may be described as a rectangle, 40 feet long by 25 feet wide. The fronts are treated in a substantial and effective manner by means of pilasters and ornamental ironwork in the upper part. The roof is of one span of domical form, surmounted by a lantern; a little ornament has been introduced in the shape of lead lights of delicate tints of cathedral glass. All the latest improvements in ventilating tackle and internal fittings have been introduced. The heating is by Messenger's patent elastic-jointed pipes, which, owing to the facility with which the joints are made or taken apart, are having a large sale for heating buildings of all kinds. The whole work has been designed and carried out by Messrs. Messenger & Co., horticultural builders, of Loughborough.

**Leamington Town Hall.**—This building was opened lately. It has been erected at a cost of over 16,000*l.* from the designs of Mr. John Cundall. The site cost 5,300*l.* There is a court-house measuring 80 feet by 40 feet, which is ventilated by Boyle's system, and a council chamber measuring 50 feet by 30 feet, which has stained-glass windows. The style is Renaissance. Mr. Fell was the builder.

### SCHOOL BUILDINGS.

**Burton-on-Trent.**—A Baptist Sunday-school has been opened. The building is two storeys high, the ground floor being apportioned in ten classrooms, with lavatories, &c. The upper floor is a large room capable of seating between 400 and 500 children, and adjoining are secretary's and librarian's rooms. Mr. Mills, of Derby, was the architect, and the work has been carried out under his supervision by Messrs. Lowe & Sons, the sub-contractors being Mr. Adams, Horninglow, for woodwork, and Messrs. Pickering Brothers for plumbing, painting, &c. The cost is about 1,600*l.*

**Coventry.**—New schools for St. John's parish have been erected from the designs of Mr. N. W. Vickers, architect, of Liverpool, by Mr. C. Haywood, jun., builder. The building is intended to accommodate 500 children—boys, girls, and infants.

**Erdington.**—The memorial-stone of a school to be erected at Erdington by the Aston School Board has been laid. Mr. E. R. Robson, F.S.A., adjudicated in the competition, and out of six designs sent in that of Messrs. Henman & Timmins, of Bennett's Hill, Birmingham, was selected. Mr. W. Bennett, Lozells, obtained the tender for building the school at a cost of 3,277*l.* The school is arranged in two departments, one for 160 boys, another for 240 girls and 60 infants. The classroom system has been adopted. In addition to separate classrooms the general schoolroom for each department is capable of being easily subdivided into classrooms by an arrangement of screens. The elevations are in plain and moulded brickwork, substantial and distinctive in appearance.

**Faversham.**—The memorial-stones of a Wesleyan infant-school, which is to be erected in Salomon's Lane, Faversham, have been laid. Mr. Fuller is the builder, and Mr. Dawson the architect.

**Rushden.**—Baptist Sunday-schools, erected from the designs of Mr. Edward Sharman, of Wellingborough, have been opened. The gable front is built of Leicester brick, with Bath stone dressings; the rest of the building being of ordinary red brick, relieved with stone dressings. It is roofed with Bangor slates and ornamental ridge tiles. The contractors for the building were Messrs. C. & W. Bayes, Foskett, Rushden. Mr. W. Woodward, Rushden, executed the plumbing and glazing work, and Mr. A. Marriott, Higham Ferrers, supplied the heating apparatus. Boyle's patent ventilating apparatus is used. The building cost between 1,000*l.* and 1,100*l.*

**Walsall.**—The foundation-stone of a Sunday-school and mission-room in connection with St. George's Church, Walsall, has been laid. The building will be erected from the designs of Mr. H. E. Lavender, of Walsall, and the cost will be about 1,000*l.*

**Wantage.**—National day and Sunday-schools have been opened. The buildings have been erected by Mr. John Wheeler, contractor, from the designs of Mr. A. B. Allin. The buildings are of brick with stone dressings.

### GENERAL.

**The Duke of Portland** will open the Kilmarnock Art Exhibition on December 9. Several artists have promised to contribute works to the exhibition.

**The Eighth Annual Fine Art Exhibition** opens in Dundee to-day (Saturday).

**Mr. Charles Webb**, ironmaster, Tettenhall Road, Wolverhampton, has intimated his intention of presenting to the Wolverhampton Corporation Eugene de Blaas's picture, *At the Carnival*.

**The Bewick Club** intend to hold another exhibition of works of art in the early months of next year.

**Mr. James Loft**, who was for a long time curator of the antique school in the Royal Academy, died in London on September 21.

**The National Association for Promoting Technical Education** has appointed a deputation to visit the Continent for the purpose of reporting upon the technical instruction given to the industrial classes in Germany, France, Switzerland, and elsewhere, and the influence of such instruction upon manufacturing and other industries at home and abroad.

**Mr. Thomas W. Cutler** is, we regret to learn, lying seriously ill at his house in Queen Square, Bloomsbury.

**The Alexandra Palace** at Muswell Hill is to be reopened in March as "the World's International Exhibition," under the management of Mr. G. C. Levey.

**The Council Chamber** lately constructed at the Guildhall was opened on Thursday.

**A Congregational Church** at Balham, erected from the designs of Messrs. Searle & Hayes, of Ludgate Hill, was opened on Wednesday.

**The Inner Circle Railway**, now completed, which was opened on Wednesday for experimental traffic, will be opened to the public on Monday.

**The Leeds Town Council** on Wednesday decided to purchase thirty acres of land, at a cost of 12,000*l.*, for the purposes of a recreation ground in Wortley.

**The New South Wales Government** have proposed to the Legislative Assembly to construct 1,490 miles of railway, at a total estimated cost of 14,000,000*l.*

**The Council House** at Salisbury was on Saturday last the scene of a malicious explosion, but no trace of the offenders has been discovered. The principal damage was the destruction of glass. The building was erected in 1794.

**The Health Committee of the Liverpool Corporation** recommend the appropriation of 25 acres of Wavertree Park as a site for a hospital for infectious diseases. They recommend the erection of a series of buildings with a wide belt of land and trees to secure isolation.

**A New Opera House** was opened in the Radial Strasse, Pesh, on Sunday last. It was designed by M. Ybl, and has been constructed at the cost of the Emperor of Austria.

**Messrs. W. B. Wilkinson & Co.**, granite concrete paviors, &c., of Newcastle and London, have removed their London office from 27 Great George Street, Westminster, S.W., to 13A Great George Street, Westminster, S.W.

**Messrs. Robey & Co.**, of the Globe Works, Lincoln, have been awarded the highest award at the Crystal Palace International Exhibition—viz., diploma of honour for their patent "Robey" winding engine, compound Robey engine, and other machinery.

**A Tender** by Messrs. Bull & Sons, amounting to 79,000*l.*, for the construction of a convalescent scarlet-fever asylum at Winchmore Hill, has been accepted by the Metropolitan Asylums Board.

**The Glasgow Masons**, after a strike of eight weeks, have resumed work at the old rate of 7*d.* per hour. The master masons have agreed to consider whether an advance can be given in the spring of 1885.

**Mr. William Scott**, an architect and builder in Arbroath, died on Saturday last. He was fifty-four years of age. He was architect to the Burgh School Board, and in that capacity he prepared the plans for the Hill School, the large addition to the Abbey School, and the additions to Inverbrothock and Parkhouse Schools, doing also the work of builder. He designed and built the new Guild Hall, the Drill Hall, and St. Mary's Hall, attached to St. Mary's Episcopal Church, in Arbroath. He built the Public Hall Buildings, the Bank of Scotland branch office, and St. Margaret's Church, but without being the architect of these structures.

SOLE ADDRESS.

Note Trade Mark.

GRUNDY'S PATENT  
WARM-AIR  
VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent  
consist in the heating surface being greater than any  
other Fire-grate introduced to the public. It is very  
simple in construction, and is made in the form of a Stove,  
the back of which is semicircular in shape, with gills  
behind and smoke-nozzle on top, all cast in one piece.  
The same can be attached to any design of a Register or  
Stove front. It is very suitable for schools, class-rooms,  
waiting-rooms, hospitals, offices, dormitories, and dwelling-  
houses, from the cottage to the mansion. Design and  
specification post free on application.

TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.  
"SIR,—I have much pleasure in testifying to the  
efficiency of your patent Warm-Air Fire Grate. It has  
been very successful, and given every satisfaction where I  
have used it.  
"Yours, &c.,  
"JAMES WEIR, F.R.I.B.A.

"To Mr. Grundy."

"Baptist Chapel, Clapham Common, London. Richard  
Webb, Pastor, 10 Grafton Square.

"February 15, 1884.  
"DEAR MR. GRUNDY,—I have pleasure in testifying to the  
excellency and efficiency of your patent Fire-Grate. It is  
the most charming invention for heating a large room I  
have ever known. I shall have pleasure in showing it to  
anyone who wish to have their schools or rooms pleasantly  
and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,  
July 1884.

"DEAR SIR,—I have very great pleasure in stating that  
the first stove, or patent warm-air ventilating fire grate,  
adopted by me in school at Seaton, and a second in a  
Cocoa Palace, have given such satisfaction that I now  
order eleven to be inserted in New Upper Grade Schools in  
course of erection at West Hartlepool. They are the most  
economical, efficient, and easily managed stove at present  
before the public.  
"Mr. John Grundy."

# The Architect.

## THE ATMOSPHERE OF ART.

AN observation was made at the recent Birmingham meeting which could scarcely fail to produce an impression, namely, that one of our leading firms of calico-printers employ English designers, but send them to live in Paris for the sake of what we may call artistic air; "they find by experience that life amidst inartistic and unsympathetic surroundings chills and blasts their designing powers." There are some who will pooh-pooh this. There are many who will be unable to understand it. But there are others—and their number is happily increasing daily—who will recognise, not only the force of the statement as part of an interesting argument, but the still more interesting principle which it illustrates.

The importance of congenial associations has always been acknowledged in professional life. It is not merely that birds of a feather flock together, although even in that less elevated manifestation of human nature the principle at work is one of the same kind. In clerical, legal, medical, military, and naval life, for instance, it is well known that there is in professional society a certain peculiar sympathy which not only stimulates the mind to exertion in the one particular direction, but constitutes the very life-blood of professional existence in its practical form. Even in commerce, in spite of open competition on one hand and private suspicion on the other, there is a sense of fraternity in the public market without which enterprise would languish and confidence disappear. In the world of imagination none the less, indeed all the more, it is essential that those whose lives are devoted to the work of genius should constantly breathe the breath of artistic life—live in the atmosphere of art.

Possibly they may be right who are inclined to say there is a little affectation in the enthusiasm of those artists who cannot live out of Rome or out of Paris. There are men, as we know, who cannot live out of our own London, soot and fog notwithstanding, for the sake of considerations sufficiently academical and, we may say, artistic. But this affectation, such as it may be, we need not very much complain of after all; for the very reason which has to be assigned for it is direct evidence of the vital importance of the atmosphere of fancy which confers so much advantage upon artistic headquarters. The pervading artistic element which is the voluptuous joy of Rome, even they who have not been privileged to enjoy it can fully appreciate. The artistic character of universal Paris also no one can fail to acknowledge. And even in London, we may add, with all sincerity and not a little pride, the advancing vitality of a hundred branches of art now finds a home not at all to be disparaged. The atmosphere of art has forced its way into London, and is becoming clearer every day. We are bold enough to think—even setting patriotism aside—that in another generation or two it may be, for many if not all practical purposes, almost as clear as it is anywhere else in the world or ever has been.

In fact we are not quite sure that, even now, it is necessary for the calico-printers alluded to by Mr. RATHBONE to send their designers to Paris in preference to London; unless, indeed, there be in question the study on the spot of some special field of antique workmanship, in which case it is scarcely the universal artistic sentiment so much as a particular one that is relied upon. Many English experts have of late years been inclined to encourage the feeling that already the difference between French and English design is not a matter of degree, but of national style alone. In plain language, we have been led to believe that, in not a few departments of artistic manufacture, English taste has been proving itself equal to French in merit, although different in character; and so much so that our clever neighbours themselves have been warning their manufacturers of this same novel and alarming competition as threatening their foreign markets. The South Kensington establishment, much as it might, in the opinion of some, be improved in respect of efficiency, has certainly helped to accomplish thus much with *éclat*; and, seeing that the

museums, schools, studios, and shops of London may be said to bring together, not only all English work, but all foreign work that is worth having, in homage to the dominant wealth of English purchasers, this again is a consideration which must exert no little force in producing an atmosphere of art for those who here carry on the study or the business of design.

One interesting peculiarity of this local artistic air in our more modern times is the circumstance that it no longer circulates around the sacred person of this and that individual GAMALIEL. We have no DRYDENS and JOHNSONS even in literature now; we have not so much as a CARLYLE. A LEIGHTON or a MILLAIS prefers, if only a book must be written, that his enemy should write it. Officers of the Royal Engineers somehow sit in the chief seats at South Kensington; and so far, doubtless, in accordance with the spirit of the time, or they could not keep them. Sir HENRY COLE, whatever may be said of him, put a stop once for all to the personal leadership of academical authority, and set up the independence of general development instead. When we see our own architectural chiefs, a NORMAN SHAW, a PEARSON, a WATERHOUSE, professing that not one of them can undertake to read half a dozen lectures to the students of the Royal Academy, we may feel a momentary surprise, but we are not precluded from reflecting that, in the circumstances of the moment, this may nevertheless be for the best; for the platitudes of EDWARD BARRY and the paradoxes of STREET were a fit ending perhaps for the reign of professorial ascendancy, even in such art as the architectural.

Neither does it seem to be likely that the sovereignty of individuals is to be transferred to coteries in these days of ours. The atmosphere of art does not emanate from Burlington House or Conduit Street any more than from the pigeon-holes of South Kensington. Rival academies, under a variety of formidable names, have started up in all directions, and the division of artistic labour and the distribution of artistic influence are the order of the day. Out of London also, here and there, the vital air of art is beginning to circulate effectively. Millionaires in Liverpool, Manchester, and the northern towns buy the great pictures of the London market as a mere investment of surplus capital; but even so sordid a policy as this tends all the more to diffuse the atmosphere of art.

Perhaps the most pleasing reflections, however, to which Mr. RATHBONE's statement gives rise, may be such as turn upon the satisfaction that must be felt when we learn that such extremely prosaic art manufacturers as calico-printers are supposed to be are so much alive to the benefits of the artistic air. They have learnt experimentally, by the supreme test of the counting-house returns, that their designers cannot be expected, amidst the dull associations of a manufacturing town, so to thrive in respect of fancy as to produce good artistic devices; or, at any rate, they have learnt that these men, regarded in whatever mechanical light, thrive so much better in a more artistic atmosphere that they produce devices of a much greater value; and indeed the conclusion they have come to is that it pays them to send their designers to live in the most artistic atmosphere that can be had. Certainly this is highly satisfactory. English political economy at length, in the most businesslike way, "without any nonsense" and so on, is declaring for the actual market value of the most subtle imaginative influences, as a direct equivalent for pounds, shillings, and pence, dollars and cents, florins, roubles, hides and tallow, palm oil and ivory, and all sorts of substantial commodities, however widely these may open their eyes at first on finding themselves made of no more account than the shade of a colour or the turn of a line.

But do not let us forget another pleasing reflection. Mr. RATHBONE's firm of calico-printers, who seem to see their own interest so well, have not concluded to employ Parisian designers; they prefer English designers provided they go to live in Paris. If we understand Mr. RATHBONE aright, the men in question are all Englishmen; and we welcome this incident, not for the sake of patriotism so much as on account of the hopeful estimate we form, in the most cosmopolitan way, of the inherent intellectual value of the Anglo-Saxon fancy when advantageously developed. What we look for in its more characteristic manifestations is masculine vigour, a quality in art which in modern times has been far too little cultivated. Science has been of the boldest, removing mountains almost recklessly everywhere; art has been too often, even at its best, effeminate, dainty, feeble, timid, inanimate.

Speaking of the atmosphere of art in Paris, the question arises whether it is not somewhat of an enervating air after all. Perhaps it is; but time waits. Taking architecture as the typical art it is, we certainly do not find, for instance, that Englishmen, or Germans, or even Americans, who have been students in Paris, turn out in after years to be so much characterised by muscularity as by elegance; and we may no doubt fairly expect the rule to hold good in decorative art generally. But in England at all events the muscularity can be got at home, and perhaps a little too much of it sometimes; and the value of the elegance for the present we may safely consider to be all the greater. Without, therefore, going so far as to recommend the artistic atmosphere of Paris for English designers at large, we may repeat that the intelligent recognition of its beneficial nature in such a case as that which we have had before us cannot be regarded otherwise than as a most hopeful sign, amongst others, of the reality of the rapid progress which England is well known to be making in the practical utilisation of the artistic element of life.

### HANS MAKART.

VIENNA, the gayest capital in Europe, has gone into picturesque mourning and genuine lament for HANS MAKART, the painter, the son after her own heart, whom a friendly critic has described as the impersonation of her especial light-hearted Sybarism. This gifted artist has died suddenly, between forty-four and forty-five years of age, in the full swing of his power and popularity. His career has been short, but rarely brilliant. He was born in 1840, at Salzburg, where his father was keeper of the apartments in the imperial Lustschloss called Mirabell, a residence beautifully situated amid gardens, and set forth within in the splendour of eighteenth-century taste. MAKART the father, and an uncle, pastor in the Tyrol, had some artistic gift and more enthusiasm as landscape painters; an uncle on the mother's side, who held a post in the castle, was an adept at a certain class of decorative painting, such as emblazoning of heraldic devices, and so forth. Little HANS thus grew up amid a splendid *entourage* and influences benign for the artistic temperament, as also for less desirable inheritance duly received—extravagance and restlessness. The father, giving way to these foibles, lost his post, enlisted in RADETSKY'S Italian regiment in 1848, and left the mother to shift for herself and child. She had some situation in the castle and did her best, apparently, which was not much, for the boy was left to run wild. He learnt nothing at school, was a taciturn but impish creature, delighting only in dreamy idleness, gazing at curious and beautiful things, and trying to draw. As he would not do anything else, the drawing was encouraged, and his maternal uncle, BÜSSEMEYER, taught the lad and gave him occupation. At sixteen they sent him to Vienna to the Academy, where not all his aptitude and the unmistakable cleverness of his drawings made other than unfavourable impression on the pedantic and rule-beridden officials, who turned the boy away to find his road home again in much poverty. But better times broke with a visit from Herr SCHIFFMANN, a landscape painter from Munich, who had married into the family, and came over to Salzburg to see his wife's relations. This painter was more discriminating, and read rightly the presage of genius in HANS MAKART'S imaginative inventions and intuitive colour; he taught the lad oils, obtained a small allowance for him from Archbishop TARNOTZKI, and in 1859 took him off to Munich to seek entrance into the school of CARL PILOTY, the historical painter. Unfortunately there was no vacancy, and for two years more HANS depended on chance training. However, he worked hard and with enjoyment, copied in the Pinakothek, painted every object worth painting in the good SCHIFFMANN'S house and *atelier*, painted the portraits of his host and hostess, and after two years was ripe for the especial advantages of the *Pilotyschule*, to which he was admitted in 1861, among the pupils of multifarious nationalities, varied styles and tastes, whose individuality PILOTY sought to develop while training them in the principles and technique of art.

MAKART'S peculiar capacities, which did not alter but merely strengthened as his powers of expression increased, soon showed themselves; he looked at nature then as he never ceased to look, through the intermediary of his fervid imagination; he drank in sensuous beauty with perpetual

thirst; his brain ran riot among themes which set forth the pride of life; earth satisfied him, not as symbol of something higher, but in its own round of imagery, transformed into a sensuous ideality by the alchemy of his artistic mind. He had supremely what the Germans call a talent for *das Malerische*—the paintable. Such a man is a born colourist, and that MAKART was a splendid colourist not even his enemies deny, although they may accuse him of strange mixtures or audacious and artificial splendour.

The first public essay of the young painter was on occasion of a commission for decoration of a dining-hall in St. Petersburg, which fell to the Piloty School. One panel was carried out by LIETZENMAYER and WAGNER, the other by MAKART. They were exhibited at the Academy, and MAKART'S composition, a scene in Venetian patrician manners and costumes, drew from a distinguished critic the comment, "*This man is a born painter.*" In 1863 MAKART went with LENBACH to London, where the works of our English REYNOLDS made a great impression on him. He painted a number of small pictures, from the "*Merry Wives of Windsor*" and fancy subjects; landscapes, too, one of which—*Roman Ruins*, the result of a visit to Italy—was badly hung at Paris in 1867, which so vexed him that he over-painted and spoilt it. Then came *Moderne Amoretten*, a study of children and young girls, some naked, some clothed; mongrel creatures, fascinating yet repellent, drawn with immense freedom; the background and details of flower and foliage put in with luxuriance and dash; the colour luscious and luminous; the technique founded on RUBENS. Munich wondered, and on the whole applauded. The picture went to Vienna, and there drew attacks absolutely brutal from the press, with the honourable exception of Professor PECHT'S criticisms in the *Neue Freie Presse*, and stirred the Academic body to crushing disapproval. Next followed the *Plague in Florence*, a canvas twenty-four feet by three, painted as a frieze; a scene of Mediæval orgy, in which nude and costumed figures are combined with ostentatious luxury in themes of dramatic violence and voluptuousness. The original design was to illustrate the "seven deadly sins." Again the painter's audacity and artistic power took the Munich world by storm. The figures in high light, painted over impasto of white and glazed with asphaltum, the shadows forced up in mellow depth, melting flesh tones, charm of line and colour, sent painters into experimental imitation, outsiders into a wrangle of words.

The picture had a tragic story; it was bought by a Jewish banker at Florence, whose tastes were in accord with the subject, even to his own mortal hurt, and after his death divers chances took the *Plague at Florence* to Berlin.

HANS MAKART meanwhile married his love in Munich, a simple girl of the people, whose beautiful blonde head received distinction in many of his pictures, notably in the *Catherine Cornaro, Queen of Cyprus*. He went to Rome, whence he sent the *Sleeping Juliet* now in the Belvedere, and then settled in Vienna, where his heretofore persecutors had changed their cry, and honours and wealth awaited him. The Emperor gave him a studio, and he painted assiduously, albeit soon giving rein to the spirit of pleasure-loving luxury which besets and too often befools the Viennese. Two decorative pictures known as *L'Abundantia*, the frieze for the Dumbas Palace, an allegory of Industries, the four groups of *Dawn, Midday, Evening, Night*, and, lastly, the famous *Catherine Cornaro*, chiefly mark the years up to 1873, when the last picture was shown at the International Exhibition. Later on we had it in London, at the French Gallery in Pall Mall, and the Veronese-like state and circumstance of the composition, the loveliness of the female types, the luxuriance and freedom with which figures and draperies were treated, must be fresh in everyone's mind. The luminosity of the painting and the splendid coloration, introducing tints of Oriental splendour, the beauty and *bravura* of the whole thing, dazzled the eye, and inclined one to look leniently upon the indications of a certain theatric ostentation and cheap effect which of late have increased upon the artist. Shortly after the completion of this picture, which with some is still held his master-work, MAKART lost his wife, went to Rome, came back to Vienna, and plunged headlong into the wildest expenditure, painting and spending right and left. The *beau monde* and the *demi monde* favoured him alike; he could paint as many portraits as he would. He organised *tableaux vivants* and *spectacles*, and entertained like a Mediæval noble. He painted a drop-curtain for the Vienna Theatre from SHAKESPEARE'S

"Midsummer Night's Dream;" he painted a sumptuous *Cleopatra*, and began the famous *Entry of Charles V.* He went to the East with Professor MÜLLER, and lived with him in an old palace at Cairo; roamed about and saw strange things, and filled his fancy full; painted also studies of Nubians and Fellaheen, and so forth. Finally dashed in his famous *Niljagd*—a quite amazing performance, depicting a chase of river creatures in CLEOPATRA'S days—crocodiles and sharks and birds, while the great galleys swing in the hot sun, and superb ladies look upon the wild scene, while others cast the spear. The impetuosity of the painter's genius has full swing in this artistic feat.

In 1875 the huge historic canvas, the *Entry of Charles V. into Antwerp* was shown, but unfavourably, in a small room at the great exhibition in Paris, where it did not raise as much enthusiasm as previously in Vienna. This stupendous undertaking among modern performances had taken the painter to Spain and to Antwerp for studies of historic costume and locality. It dealt with an immense number of figures and a crowded, even tumultuous, *mêlée* of horsemen and footmen, soldiers, pages, ladies, naked girls, children. The female figures were lovely, the management of the abundant material on the whole masterly. Isolated figures are splendidly drawn, isolated heads perfectly rendered; draperies, objects, fantastic *coiffures*, armour, brocade, all forced up with inventiveness and free-handed power. Yet, on the whole, the highest judgment pronounced that this animated *tour de force* might be fairly thus entitled, but hardly attained the dignity or solidity of historic art. The picture won for the painter the honour of Professorship in the Vienna Academy, but it was not bought by the State. Indeed, it is only lately that the painter received any commission to decorate a public building in the city which held him in such honour, namely, life-size decorative figures of famous artists in the new art museum.

Since the painting of *Charles V.* the style of MAKART has become more and more decorative, and he has of late too often permitted his art to degenerate into meretricious show and mere costume-painting, although at times pulling up and showing that his power was really as great as ever on the old lines. *A Bath of Diana* is a recent picture of nude beauty. Various portraits of charm or splendour showed his fidelity to the school of RUBENS. When he did not let his technique fall into careless and cheap effect, only too easy to his sleight-of-hand and spontaneous ease, no one could surpass him for certain masterly brushwork and breadth. He was ever the painter and the colourist. An ill-judged marriage, a life of excitement and luxury, have told upon a frame always at high-strung tension. Only the other day an accidental fire worked ravages in his costly studio; many things had worn down his nervous system. When disease attacked him he had no strength to resist, and the fitful flame of life and genius flashed out at once.

His career as an artist and a man leaves lessons behind it of stern import. The creed of sensuous beauty-worship has seldom had a more ardent or more gifted exponent; but this art of HANS MAKART, splendid apparition as it is, must pass with him, for in it were the seeds of corruption.

## MODERN BIRMINGHAM.

[BY A CORRESPONDENT.]

THE occasion of the recent Congress of the Social Science Association at Birmingham seems to afford an appropriate opportunity for saying somewhat as to the manifest improvements that have taken place in the architecture of that town since the first meeting of that Society was held there. The lamented decease of the well-known architect, Mr. J. H. CHAMBERLAIN, who contributed much to the embellishment of Birmingham, and whom his fellow townsmen delighted to honour and employ, leads us also to some consideration of the character of his special work in connection therewith.

Birmingham is a large and important, but not on the whole a very impressive, town, and generally resembles some second-rate district of London, with a stronger sprinkling of mill chimneys. It is, however, set amidst pleasant rural suburbs, which, as in the direction of Edgbaston, for instance, have been well laid out, and these, now that plantations have come to maturity, have an appearance of much beauty and refinement. Then, in the centre of the somewhat commonplace congrega-

tion of brick buildings which constitute the town proper, a goodly number of municipal and other buildings of considerable importance and varied excellence have, as an after-thought, become grouped together, but to these there has apparently been neither time nor means to provide proper approaches. The members of the Congress, at whose disposal many of these structures were liberally placed for the conduct of their business, and who were hospitably lodged and entertained in the suburbs, reached through comparatively insignificant streets, may, therefore, be excused from asking, as we know some of them did ask, "Where is the town?"

In New Street, it is true, are some good shops, and Corporation Street, when completed, will doubtless produce a better impression hereafter, but Birmingham needs some radical measures in the way of improvements, such as are already in contemplation, and which the energy of its townsmen are sure before long to carry into effect. For the present, however, we are almost forced to confine our remarks to the specimens of architecture which are somewhat happily concentrated in its centre, and which now alone arrest the attention of strangers.

These, many of which are stately in themselves and picturesque in their combination, form a curiously motley group that is eclectic enough with a vengeance. It might indeed well be asked with regard to this, not as with the rest of the town, where it is, but rather what is it? Pagan or Christian? commercial or æsthetic? practical or otherwise? Its principal structures are ranged around a veritable Corinthian temple, which does duty for a Town Hall. This, for want of elevation on such a rocky acropolis as it might be supposed to be accustomed to, has a fairly rusticated basement to lift it above the level of the streets, so that entrance into it is gained by some far from dignified openings below, leaving the porticoes above for ornament rather than use.

This early and isolated attempt in the antique monumental order seems to form a fitting commencement of the Battle of the Styles which eclectic Birmingham has since, and is still, waging around it. The partisans of Classic and Gothic seem about in equal force, with victory, fickle as fortune, inclining first towards the one party and then towards the other, indecisively.

Nor is the resulting inconsistency here confined, as elsewhere, to merely placing side by side alternately, or *vis-à-vis*, works borrowed from Italian or Teutonic precedents, but these contrary types are sometimes jumbled up quite inextricably even in the same buildings, and in the productions of the same architects. Such minor *mésalliances* as the addition of Renaissance features to buildings of the Italian of Rome, or of mongrel Victorian with Florentine, of Tudor and thirteenth-century Gothic, are too common even to strike as eccentricities. Nor are the most startling combinations of colour and material infrequent; sober stone façades are, for instance, fretted in parts only with the glitter of mosaic, so that all possible transitions from the grave to the gay are indulged in on the same buildings. Symmetrical structures are placed in side streets where no possible point of view of the complete façades can be obtained, and the utmost defiance of symmetry is paraded on sites where decorative open spaces before them seem to demand it. Had PUCK, in fact, been commissioned to set all the Town Council of Birmingham and their architects by the ears, he could not really have improved upon the confusion worse confounded that he would find already provided to his hand.

The late very clever and greatly esteemed Mr. J. H. CHAMBERLAIN must in particular have been an architect gifted with the utmost complaisance towards his employers, with no definite will of his own and ready to bow to the whims of one mayor after another, or else he was himself a man of many minds, and strong-minded enough to bend others to them. He appears, at any rate in his works, a sort of architectural wizard, for at the beck of others or caprice of his own he began buildings in one style to finish them in another, or more often in what were better described as no style.

The original building of the Birmingham Free Libraries—a sober and respectable structure of Italian architecture of the well-known Roman type—is now approached by a portico, handsome enough in itself, but of a florid Renaissance character. It contains on the ground floor a spacious news-room with iron columns, with brackets supporting girders from which spring brick arches, producing an interior for which a railway engineer rather than an architect might be credited; but on

the floor above, the corresponding supports in the reference library have blossomed out into polished granite piers of somewhat ungainly proportions, carrying semicircular stone arches and an elaborate ceiling, decorated in very inharmonious colouring, the prominent tints of which are blue, green, pink, and white. The staircase vestibule has its walls of red brick with a dado of tiles, with geometrical designs in pale blue and white forming a harsh contrast, not improved by the kaleidoscopic coloured glazing of the windows. An Elizabethan apartment has been added to contain a special SHAKESPEARE library, completing perhaps an historical, but not a consistent, architectural series of apartments within.

As regards, therefore, this building, we are forced to confess, in the words of the published report on it for the years 1881 and 1882, "that, as regards the decoration, the most unobservant visitor cannot fail to be struck with its almost infinite variety of design." We wish we could add with its harmony as well, but we cannot; nor can we agree that "the same manifestation of skill in the use of colour, apparent in the interior decoration, is visible also in the exterior design of the Edmund Street front," for, though some of the designs and their treatment are very good, they are inharmonious in their combination and character. In fact, Mr. CHAMBERLAIN has, in our opinion, much to answer for in perverting the taste of the inhabitants of Birmingham in this respect of colour. To complete the incongruous character of the pile, a florid Gothic façade occupies the end opposite that of Edmund Street, and the great hall of the Midland Institute, to which this gives access, and in which the inaugural meeting of the Congress was held, is a spacious and in many respects a fine apartment, not, however, remarkable for its acoustic qualities, and decorated in a restless manner and with colouring which is not at all harmonious.

*De mortuis nil nisi bonum* is an excellent motto, which we fear we must be thought to have transgressed in the foregoing remarks. From all we have heard of Mr. CHAMBERLAIN, nothing but good could be spoken of the man; but his works live after him, and so far as they may influence the taste of the inhabitants, we feel bound to speak out our judgment of them. He seems to have followed rather than led public opinion, inclining more to Gothic than Classic when permitted to do so, but in a somewhat florid and fanciful manner, without great purity of detail or dignified treatment of the art, so many opportunities in which were afforded him. The School of Art, left unfinished at his death, and now in process of completion from his designs, seems to possess considerable promise, and we trust it may prove a favourable specimen of his talents, which were undoubtedly considerable, and so redound to his posthumous fame. It is wholly in the Gothic style; it has a symmetrical façade, though facing a narrow street, and a mixture of details of diverse periods of Mediæval architecture are becomingly conspicuous. The Gothic fountain in front of the Town Hall is a favourable example of his work; but the canopy over the statue to Mr. DAWSON is less so, being far too florid and fanciful for its purpose; and one looks with relief from this to the quiet treatment of the statue of WATT on a simple pedestal. Mr. CHAMBERLAIN'S other works in the town and its neighbourhood have been very numerous, and include a large number of Board schools and several churches, none of which latter, however, have been of an important nature. Altogether his career was one of a highly-creditable character, and he has left behind him a good local reputation, which he fairly earned.

We have not space to mention many other works, and shall only refer to the very stately, and, on the whole, satisfactory, pile of building, on a fine site, formed by the Council House, the work of Mr. YEOVILLE THOMASON, in order to express our regret that the Art Gallery adjoining it, by the same architect, is not in character therewith. This incongruity adds to the *bizarre* appearance of the locality, and an angle tower facing the square of the Town Hall, which might have been treated so as to produce a noble effect and bring the rest together, quite fails to do so.

One cannot dismiss this locality from our notice without comment on the Mason Science College in Edmund Street, which was lent to and formed the principal scene of the labours of the Social Science Congress. This is really a very excellent building in early thirteenth-century Gothic, most creditable to its architect, Mr. J. A. COSSINS, both externally and internally; and Mr. HOPE, the President of the Congress, might fairly have referred to it to refute the popular error that

this style does not permit of practical as well as of æsthetic excellence, for the building is thoroughly well suited for its purpose. We must own, however, that really beautiful as is the symmetrical and well-studied elevation, it does not seem to have been designed for the site it has to occupy, half facing the area before the Town Hall and half down Edmund Street, a position which called for quite other and more picturesque treatment. It is saying a good deal when we aver that it would be worth while to take a lesson from our American cousins, and shift it bodily *vis-à-vis* with the Town Hall. Mr. COSSINS is now building a Gothic club in close vicinity to this other structure of his, which also promises to be an ornament to Birmingham.

## STUDIES OF LONDON CHURCHES.

[BY A CORRESPONDENT.]

(Concluded from page 214.)

THE church of the *Holy Trinity*, Knightsbridge, is notable as built where one of the oldest churches in London stood (as the vicar informed the writer). On its site was formerly a leper-house in connection with Westminster Abbey. It is worth mentioning, too, that the Abbey was supplied by a conduit just beyond Holy Trinity, at the east end of the Serpentine, till A.D. 1868, as recorded on a tablet to the memorial pedestal there. The church, removed in 1860, had been erected by license from Archbishop Laud in the first year of his episcopate, in room of one then "so ancient and decayed as to be ready to fall." (Mackeson's "Guide to the Churches of London.") The great difficulty which the skilful architect, the late Raphael Brandon, had to contend with was the very cramped size of the plot of ground with which he had to deal. Moreover, it was impossible to follow the usual and pleasing practice of the English Mediæval church, happily surviving to our own days—I mean that of orientation—as houses closely abut the east and west sides, not giving sufficient length for that purpose. The only entrance and the only façade to be seen is the south end of the nave. It is true that the north elevation is visible from the drive in Hyde Park, if looked for, but is not conspicuous. There is consequently no true chancel—only a makeshift arrangement for the same. There are scarcely any windows towards the east and west, and their absence is regrettable, but of course could not have been avoided. There are only two windows on the east side. To make up the deficient accommodation on the ground floor, the church has been galleried up to such an extent as to ruin its effect. No pretence at ornament has been made in the design of the galleries, which are miserably poor, architecturally speaking, and much block up the interior. At the south end are, in effect, two galleries one above the other. The upper one contains the organ, placed in one angle, and not in the centre. The roof of the church is of open-timbered hammer-beam construction, with a quasi-clerestory, very effective internally. But unfortunately the building is so short and so narrow that the student has to crane his neck to see the "clerestory." Externally, the look of this range of windows is very unsightly; but, as has been mentioned, they are not at all prominent.

The church of *All Souls, Harlesden*, the design of Mr. Tarver, is a building specially devised with the object of having no piers or other obstruction to view, so as to be thoroughly congregational, of ample width, and with all the seats facing east. It should be added that the present structure is but an instalment of what is to come. Only a small portion of the chancel has been erected, and the western end of the nave is not yet finished. However, one of the most characteristic features of the church is now existent in the shape of a large octagon, probably suggested by the circular churches of the Templars—St. Gereon, Cologne, or Aix la Chapelle Cathedral. But except in this feature of the plan there is no resemblance whatever to the churches named. There is a gable to each external side of this octagon, and under every valley is a tie-beam. All these tie-beams necessarily unite in the centre. The thrust at each angle is well carried down to the floor-line by arched braces. So, notwithstanding the considerable diameter of the octagon, it is in construction very strong, as the thrust is equal all round, well distributed, and not on any one part. The use of these ties well binds the building together. In the examples previously named, at Aix la Chapelle and St. Gereon, Cologne, the octagon has been surmounted by domes, by far the most elegant mode of roofing, and affording abundant height. Light would be admitted through the drum of the dome, but domes are costly, and in this instance the church was bound to be a cheap one. It has, therefore, been necessary to make the height of the building moderate. An open roof has been constructed, the effect of which is very picturesque, though not majestic, with its multitude of timbers. But it is the architect's intention to eventually make it a wood panelled ceiling. All the benches are free and unappropriated, and opposite each "kneeling" is a little mat hung on a knob, with a label stating that the offertory is collected in such a way that no

one but God knows how much each worshipper gives. There is also the text of two short prayers to be used on entering and leaving the church. Every one is likewise enjoined to study his neighbour's comfort in worshipping. All this is very right and proper. Would that this kind of personal appeal were more often made in churches from those who have been called to minister there! Concerning the exterior it cannot be called very ornamental or church-like. The attempt to give a more decorative appearance by the pyramidal cappings to the buttresses is not quite successful, and it would have been better to omit them altogether. There is not a band of red brick and scarcely any stone externally to relieve the monotony of the stock bricks. The windows have not a two-ordered reveal externally, but a single one, which necessarily gives them a very plain appearance. The moral to be deduced from an examination of this building is that it is, after all, better to keep to the rectangular plan, and so avoid difficulties and expenses in roofing, as well as the awkwardness of treating the design well externally, unless considerable expenditure is incurred. The attempts of conscientious architects to depart from the cut-and-dried form of plan are much to be commended; but care must be taken not to land the originator into fresh dilemmas thereby. There is much to be commended in this thoughtfully-designed structure.

The Wilberforce memorial church of *St. Mark*, Coburg Road, Old Kent Road, the design of Mr. Norman Shaw, R.A., is a very plain building externally. The west front is so for very sufficient reasons, as it is temporary, only two bays of the nave and aisles having been built at present.\* This front is covered with slates, and is about as ugly as can be imagined; but it is now in contemplation to proceed with the extension of the church, when one may hope to see the design of the architect consummated. In plan it at present consists of a nave with side aisles, north chancel aisle, chancel, and preparation for a future south chancel aisle. The nave and aisles are vaulted in wood, painted white. The aisles have tie-beams to each bay. The piers, with moulded capitals, are of red brick, like the rest of the interior, and rest on a lofty pedestal or dado of cement, the same feature being continued, like wainscoting, with mouldings of a Classic type all round the nave walls internally. The dark old wainscoting in Wren's churches is charming-looking, warm, comfortable, and handsome. But oak is too dear now to use in this manner as a general rule; the crude white dado will in all probability be painted when the church is finished. The treatment of the lower part of the piers, casing them in cement, is certainly better than doing the same with wood. The type of window to the nave aisles is that of the very crude transition from Early English to Decorated before tracery was arrived at, where the mullions run up into the head uncusped, with nothing above them. There is no possible beauty in these tentative features of an embryo style. In the east window it is fortunate that some tracery has been designed, only the central light being carried up into the head. The chancel arch has no respond pier to speak of, and is not made a particular feature; it is the rood screen which serves as the distinctive adjunct to divide the nave from the chancel. This screen is a singular mixture of Perpendicular and "Queen Anne" work, with forms adopted from a very debased period in the heads of the three lower panels. The portion of the screen up to about the height of two feet is of stone; but as all the woodwork is painted white it is not easy at a distance to discern what material has been used. The under part of the lower panels is left open in a very curious manner. The higher portion of the rood screen is much subdivided by tracery work, &c. A plain floriated Latin cross, decorated with carvings of roses at intervals, is placed in front of this tracery. "Cheek by jowl" with the tracery are twisted balusters in the Queen Anne style. The roof to the chancel is of trussed rafter construction, with framed collars and braces, having tie-rods at intervals in their naked unadorned simplicity. A telling feature in the interior of the church is the cusped arcading round the chancel walls at the level of the windows. All the arches are of chamfered or moulded brick. Externally the building is of grey stock bricks, without the relief of any other coloured materials or different kinds of bricks, no attempt having been made to render the church particularly attractive from the outside.

In the church of *St. Clement*, Lever Street, City Road, lately rebuilt, owing to the former church not being large enough, is a noble specimen of one of those majestic town churches so common on the Continent, but unusual in England till within the last few years. The type is, however, becoming much more prevalent: rising far above the surrounding houses, plain and simple in outline. The plan is simple to a fault—a rectangle, *i.e.*, nave and chancel of equal width, and the roof continuous. The chancel externally is scarcely distinguishable from the nave, the windows in both cases being of the same design. The writer is reminded in this plan of Keble College Chapel, Oxford, the design of the same gifted architect, with the difference that at *St. Clement's* there is a north aisle. In other respects there is little or no resemblance

between the two buildings, though both necessarily contain some of the well-known characteristic touches of Mr. Butterfield. At the west end is a gabled bell turret, corbelled out from the walls, containing two bells. There is a north aisle, but no room for a south, as the surrounding buildings abut too closely, the site being much hemmed in. The limit of the nave and chancel is marked externally by a projecting stair-turret with splayed sides for access to the lofty parapeted roof. This turret is crowned by a gable, the oblique sides being corbelled out with picturesque effect into a square plan. But for this feature the general outline would be very monotonous owing to the unbroken continuity of the walls and roofs. The church is entered through the north porch at the westernmost end of the building (though there is also a south door opposite to it), and the effect as one turns eastwards is very fine. The immense unbroken blank space of wall on the south side, owing to the windows being placed on the same level as the clerestory windows on the north, is of some value to the composition. Up to a considerable height this south wall is lined with plain red tiles, set square-wise, finished at top by a stone string course. Above, the wall is of stock bricks, pointed, as is the case with the remainder of the interior. The arcade of the nave opening out into the north aisle is of a bold, severe type. The piers are cylindrical, of Bath stone, on simple bases consisting of two chamfered plinths, one above the other, and with modest-looking moulded capitals. These carry stone arches, which at the abacus level are equal-sided octagons in plan, the chamfer being, therefore, a large one. The effect is good, though a hypercritic might argue that an arcade carrying a lofty clerestory, and with the weight of a roof of large span superimposed, ought to suggest greater strength, and not have so considerable a proportion cut away. The clerestory, which is also of simple design, consists of two two-light windows to each bay. It is in the knowledge of when to be modest and unassuming that one of the secrets of good architectural effect is found. Much also of the successful effect in this church arises, not from ornamentation, but from the great scale of the building. The nave roof is of a kind of which Mr. Butterfield is fond. There are trusses having their tie and king rods, and intermediate trusses, the general construction consisting of trussed braces to every pair of rafters, ceiled in lath and plaster at the back. The aisle roof is of a very plain description. A pier very slightly projecting, with angle-nook shafts, marks the division between nave and chancel. This carries a double truss, or rather two trusses side by side, over which is a floriated cross, the whole being painted. This forms one of the most original features of the church. There is a five-light traceried east window, and the sanctuary is handsomely arcaded. The reredos is lofty, containing a representation of the Nativity, over which is a gabled canopy. The latter, however, is so high that it conceals a good portion of the central light of the east window. Though the latter is glazed with grisaille, it seems curious to have put it into a new church and then partially hidden the same by placing stonework permanently in front. The organ-chamber is on the north side of the chancel, separated from it by a large arch subdivided into two. On the west side of the organ, opening out into the north nave aisle, are two very plain arches, a rather unusual feature.

The church of *St. Edmund the King and Martyr*, Lombard Street, not long since was furnished with a new organ, built in a chamber on the north side of the structure, near the chancel end. Nothing, however, can be seen of the chamber, as the pipes completely fill the opening into it. The large wooden pedal pipes are brought out into one of the arched recesses south of the regular front (the church stands with axis north and south). The growing passion for organs unnecessarily large and powerful for the church in which they are placed is to be deprecated for several reasons, architectural and otherwise. If the full force and power of the organ is brought out, the lover of music is almost deafened, and the stowing away of the pedal pipes, bellows, &c., becomes a serious difficulty, so as not to disfigure the structure and make it look like an organ-builder's factory. Salisbury Cathedral affords a notable instance. The spirit of emulation among different organists and congregations is at the bottom of this. Each congregation likes to think it has a finer organ than its neighbour. It is well, however, to bear in mind that the primary use of a church is for worship, and that elaborate instrumental music is no absolute necessity, however admirable and to be recommended for many reasons. This church of *St. Edmund* is a small one, and certainly does not require a very powerful organ. The decoration of the interior of the church is clearly from the pencil of Mr. Butterfield, in his well-known style. The semi-circular arched recesses in the walls are coloured a dark chocolate (with the exception of the tympana), the piers a kind of yellowish stone colour, the masonry pattern having been adopted. The scale of this appears rather too large for the size of the church. The cove of the ceiling is painted a bluish grey. The general scheme of decoration to the body of the church does not supply any specimens of figure subjects, but only geometrical work. But at the chancel end are representations of the *Agnus Dei*, and of the Holy Dove. On the ceiling of the chancel, over the altar, is depicted our Saviour in glory.

\* The church has been completed since this was written, but it has been thought better to leave the description unaltered.

The church of *St. Augustine's*, Queen's Gate, has been commented on previously in these columns. It is a building displaying a good deal of skill, thought, and care that has been bestowed on its design. But, like all the works of Mr. Butterfield, there are queer (no other epithet so well expresses the meaning intended to be conveyed) pieces of detail in it. For example, the manner in which the shafts carrying the principal trusses of the nave roof are crudely and abruptly cut off, immediately above the very large recessed quatrefoil panels in the great arcade, has not a good appearance. These quatrefoils, by the way, are on so large a scale that they rather demand sculpture to be added to them some day, and thus serve as medallions for scriptural subjects, as has been happily effected in the parish church, Frome, and at St. Mary Magdalene, Paddington. At present the panels certainly have rather a blank appearance. Had they been smaller and the shafts corbelled back a little higher up, with more of an attempt to avoid crudity, the effect would have been better. As regards the beautiful pulpit, the sculptural treatment of the crucified One, occupying the most important panel, which is in the form of a vesica with the attendant little angel above the Saviour, is very appropriate. In the five-light east window, in the centre our Lord is represented nailed to a Latin cross, which is plain in outline, but enriched by a kind of quatrefoil diapering. It is enclosed by a vesica-shaped aureole, with all the effulgent rays issuing from it. The remaining four lights flanking this central subject are filled with the figures of St. Augustine, St. John, the Blessed Virgin, and St. Mary Magdalene. This is a very suitable way of treating the subject. In the same window two necessarily odd-shaped forms of the tracery are occupied by representations of the sun and moon the former with a man's face, a not uncommon conventionality, but one which to the writer appears grotesque and out of place in a church. There can be no difficulty in representing the sun almost as he appears in nature, with all the rays issuing from him, or these might be treated conventionally. In some subjects this could not be done.

The writer must now close his remarks, at any rate for the present. The study of London churches, it is hoped, has been shown to be an interesting one. In the vast area of this metropolis of some four million souls, a number equal to whole nations in other countries, it is clear that there must be great diversity of design in the churches, especially when some of those which we have commented on were built nearly two hundred years ago, after the great fire. One of the great privileges and pleasures peculiar to an architect consists in his independence of the caprices of weather. When it rains, even for a whole day or days, he can turn into some grand old church, or a good modern one if an ancient is not accessible, and turn his enforced sojourn indoors into a profitable occupation. In London he has an abundant choice; for, though the City is not rich with many Mediæval churches, yet Westminster Abbey, St. Saviour's, Southwark, and St. Bartholomew's, Smithfield, alone offer an attractive field of study.

### THE PROPOSED DUBLIN MUSEUM.

DURING the meeting of the Library Association in Dublin Mr. Thomas N. Deane, R.H.A., exhibited and described the plans for the new building for the National Library. These were only preliminary plans, and therefore were subject to a variety of modifications. The scheme embodied a National Museum as well as a National Library. Its general scope was this:—The square in front of the Dublin Society's house would always be open. On the right-hand side, looking from Molesworth Street, would be the main art gallery, and at the left side, at the side where the Kildare Street Club was, and next to the College of Physicians, would be the National Library. The School of Art would be transposed to the other side, and placed in the Shelbourne Yard; and the Lecture Theatre, which now occupied a site in part of the Shelbourne Yard, would be also transposed, occupying part of the ground on which the Schools of Art were now built. The library was intended to hold 800,000 books. These were to be arranged in such a way that they could be easily accessible. The large reading-room was of semicircular shape, or something beyond that, and would accommodate 124 readers. At either side there were supplemental rooms for special readers, each 32 feet by 24, and elsewhere a room for lady readers. The arrangements of the books was an extremely important point. He had been much indebted to Mr. Archer, the Librarian of the Dublin Society, for information as to the storage and shelving of books. There were to be smaller rooms for special readers and store rooms for books, which would each contain thirty-four cases. The book cases he proposed to be of iron, and it was a subject for discussion as to what the shelves should be constructed of. He had been informed by a member of the committee of the Washington Library that it was proposed there to have glass shelves framed in iron; but the question was still unsettled.

Mr. William Archer said it was not decided yet whether the artificial lighting would be by gas or electricity. Their reading rooms would be even better lighted than those at the British

Museum. The entire accommodation for readers would be 210. If no other class of readers than those who came at present to Kildare Street was to be provided for that would be sufficient; but if, on the other hand, their lordships in London and the trustees in Dublin should think of making the library more popular, so as to cater for the artisan as well as for the cultured classes, portion of the store-rooms and other space on the ground floor to each side of the main entrance could be utilised for readers, and the books so displaced stored elsewhere.

Professor Valentine Ball believed that glass would be highly suitable for the purpose of shelves, as it could be easily cleaned and kept dry and would not harbour insects.

### THE SCOTTISH NATIONAL PORTRAIT GALLERY.

THE interesting and instructive exhibition of Scottish national portraits, which has been open since the beginning of July, in the Royal Scottish Academy National Galleries, is to be closed to-day (Saturday). As regards the arrangements for the National Portrait Gallery, it is satisfactory to know, says the *Scotsman*, that steps are being taken to have a commencement made without delay. It is hoped that, in the course of a few weeks, a temporary building may have been secured in which the collection may be placed pending the erection of a permanent gallery. The pictures already at the disposal of the Board of Manufactures will form the nucleus of the collection; and the owners of a number of the best portraits in the present exhibition have been applied to, and have readily assented to an extension of the term for which those paintings were lent. There is, we hear, the prospect of a permanent record being secured of both the present portrait exhibition and the loan exhibition of old masters, held last year. With the permission of the owners, photographs of the leading pictures in both collections have been obtained; and these, with due addition of descriptive matter, it is proposed to publish.

### THE FIRE AT CHRISTIANSBORG CASTLE.

ON the 3rd inst. a destructive fire broke out in the Danish Palace of Christiansborg. The building stood on the island of Slotsholm, surrounded with canals, which forms the oldest part of Copenhagen. From time immemorial there was a castle there, and about ninety years ago the building in which the fire took place was commenced. It was large in area, but without architectural character. The main front was about 130 yards in length, the side wings each of about 100; six storeys rose to a height of 40 yards to the cornice, and above was the elevated roof. The cost of the building was estimated at about 7,000,000 crowns, but it would be impossible to reconstruct the castle nowadays at less than triple that amount. A correspondent of the *Times* states that the apartments were decorated with great splendour, and contained many treasures of art and workmanship. Among these the most famous was, perhaps, the *basso-relievo* by Albert Thorwaldsen, representing Alexander's triumphal entry into Babylon; but most of the larger rooms contained pictures and sculptures of high worth, besides costly vases and china, Italian mosaics, and other costly furniture. In one of the wings, just under the banquet-hall, and separated from this only by an *entresol*, the two houses of the Rigsdag, the Folkething and the Landsting, were installed, each with a large hall for the public meetings and long suites of committee-rooms, stenographers' rooms, printing-offices, archives, &c. The opposite wing contained the Supreme Court, and in the uppermost storey the royal gallery of pictures. This collection can, it is true, stand no comparison with the great galleries of London, Paris, Vienna, or St. Petersburg, but, with all that, it includes a large number of paintings by renowned artists, among them several real masterpieces, and in a separate division a representative museum of the Danish school of art from its first beginning until this day. It will be seen that Christiansborg proper included within its walls enough to make the huge pile extremely valuable. But this was not all. In immediate connection with the western wing was built a church, and just behind that, parallel to some outbuildings of the palace, riding-school and stables, is situated the Thorwaldsen Museum, that unique collection of all the works due to the pure and lofty genius of that marvellous sculptor who rests here himself in the midst of the marble gods his fancy brought into life: *si monumentum quaris, circumspice!* The destruction of Thorwaldsen Museum would have been more than a national loss—it would have been a universal calamity. On the opposite side of the palace a long and low outer wing contained the Royal Privy Archives, the collection of historic documents and State papers from the oldest time unto our days—an invaluable depository of information as to the history not only of Denmark, but also of Sweden and Norway. Close to this again followed the great Royal Library with its six or seven hundred thousand volumes of books, many of them exceedingly rare and costly, besides an incomparable collection of old manuscripts, venerable codes, and

literary treasures. Very near to the castle, indeed connected with it by a low building, extend the Public Departments, the Chancery Building, as the complex of houses is called, a perfect maze of crowded rooms, winding corridors with bewildering nets of chimney-pipes, and closets filled with loads of musty paper. The Treasury Department, or Ministry of Finance, has its vaults nearest to the palace, and in them are kept many millions of ready money, besides the public funds of Consols and other valuables. Only the breadth of a street separates the Departments from the Exchange, a highly characteristic structure in Elizabethan style, with a curious steeple formed by the spirally-twisted tails of four dolphins. Behind the Privy Archives and the Royal Library is the Arsenal, in which are kept all the rifles, swords, and military accoutrements of the entire Danish army. It will be seen, in this way, that the island of Slotsholm, though forming a separate quarter of the town and of easy access from all sides, keeps within its narrow limits a very valuable part of the capital's attractions and of the treasures of the nation. A fire in any part of this conglomeration of buildings could not but be extremely dangerous to the whole. From no starting point could the risk be greater than from the castle, because its lofty walls and inclined roofs rise so high that none of the engines could reach up to them; so that a fire when first fairly started could not expect to be controlled, and then only a miracle could save the smaller contiguous buildings from catching fire and going to destruction. This miracle happened at the tremendous conflagration on the 3rd inst. The palace was entirely destroyed by the fire, but, owing to the almost absolute calm and a concourse of favourable circumstances, not only Thorwaldsen's Museum, the Privy Archive, the Royal Library, and the Arsenal were saved, but, in the few precious moments left before the flames spread to the wing of the picture gallery; most of the paintings and nearly all those of real value were carried off to a place of safety. The same was the case with the very large treasure of silver service belonging to the Court, and hoarded up for many generations by splendour-loving kings. Not only most of the paintings were saved, some in their frames and others without them, but many sculptural works—even groups heavy enough to tax the strength of several scores of arms. The archives of the Rigsdag and of the Supreme Court were thrown out of the windows in the mud, hurried up from there on wagons, and carted away like rubbish in the utmost haste. Owing to the direction taken by the conflagration and the feeble wind, there seemed to be no imminent danger to the Royal Library and the Privy Archive; but quite differently situated was Thorwaldsen's Museum. Happily, this construction is only of a moderate height. Firemen and sailors climbed up on the roof and spread thick carpets and tarpaulins kept wet by the engines; but as this was not thought to be protection enough, it was resolved to explode by dynamite a small pavilion connecting the palace with the church. At eleven o'clock the order was given, and a tremendous shock was heard all over the town. The gap thus produced seemed to stop the flames.

#### MEANS OF EGRESS FROM PUBLIC BUILDINGS.

AT the last meeting of the Dean of Guild Court in Glasgow, a statement was read which had been prepared by Mr. Whyte, the Assistant Master of Works, and in which was shown the egress capacity in proportion to its accommodation of every church, theatre, and other public building in Glasgow. Mr. Whyte says that no building should contain more persons than seventy to each foot of width of exit. It will be seen from the following that the proportion is exceeded in Glasgow:—

Scotia Music Hall, Stockwell Street—This hall will accommodate about 2,954 persons; the egress capacity is about 17 feet in breadth, equal to 173 persons per foot. The access to that portion of the gallery which is partitioned off on each side of the stage is very defective, being a narrow wooden stair. Bridgegate Established Church, East Clyde Street—This church is seated for about 800 persons; the only egress is by a door about 5 feet 3 inches wide. The two passages in the area of the church are only 2 feet 7 inches wide each. The number of persons to each foot in breadth of exit is 152. Standard Halls, 29 Main Street, South Side—This hall is very objectionably placed, being on the second floor of the building, and far from the street. This adds to the defect in the means of exit, which is about 4 feet 6 inches broad. The hall accommodates about 600 persons, or equal to about 133 persons per foot in breadth of exit. National Halls, 127 Main Street, South Side—This large hall will accommodate about 2,600 persons. The exit is towards Main Street, and is about 9 feet wide, equal to 288 persons per foot. Although this number to the foot of egress is much greater than the Standard Halls, the National Halls will compare favourably with them, the area of the hall being on the level of the street, and therefore no stairs other than those leading to the gallery. Wellington Palace Hall, Commercial Road—The large hall here will accommodate about 3,600 persons, and the egress is 21 feet 4 inches, equal to about 168 persons per foot of egress. This

egress can be improved by widening the doors, which could easily be done. Music Hall, 36 Landressy Street—This hall will accommodate about 1,500 persons. The egress is not satisfactory, being only 8 feet 8 inches wide, about 173 persons per foot. Globe Theatre, Tobago Street—This building, at present under alteration, will, when completed, accommodate about 1,033 persons. The egress is about 10 feet, equal to 103 persons per foot. A door 3 feet 3 inches wide on stair leading to dwelling-houses can be made use of, but it has not been taken into consideration. There ought to be another exit stair constructed from the gallery. Britannia Music Hall, Trongate—This hall will accommodate about 1,865 persons. The egress is about 10 feet 9 inches—173 persons per foot. Although the egress is considerably improved from what it was, it is not yet satisfactory, and on account of the hall being on the first floor of the building, and access being obtained by a stair from the street, it is more objectionable than if it had been on the street level. In future, it might be well if halls of this kind were not authorised, except upon the street level. Albion Hall, College Street—This hall will accommodate about 1,500 persons; the egress is about 7 feet—214 persons per foot. This is not satisfactory, more especially as access to the area is obtained by a stair from the street. St. James's Hall, Stirling Road—This hall will accommodate about 680 persons. The egress is 4 feet—170 persons per foot. The hall is approached by a stair from the street, and the exit is very defective. While examining this building other two exits were pointed out, but as they were not connected with the hall, nor with the main staircases, we did not take them into consideration, more especially as persons before making use of them would require to pass through a small hall. Memoranda as to capacity and means of egress of churches, halls, and theatres within the city. Churches—220 of these have been surveyed within the city; of these 164 have a capacity equal to or under 70 persons to every lineal foot in breadth of exit, the doors in 93 cases open outwards, and in 71 inwards. The other 56 churches have a capacity greater than 70 to each lineal foot in breadth of exit, the doors in 24 cases open outwards, and in 32 inwards. Halls—41 have been surveyed; 17 of these have a capacity equal to or under 70 persons to every lineal foot in breadth of exit; the doors in 12 cases open outwards, and in 5 inwards. The other 24 halls have a capacity greater than 70 to each lineal foot in breadth of exit; the doors of 18 open outwards, and of 6 inwards. Theatres—There are 5 theatres in the city, 4 of which are used at present; the doors of the entire number open outwards. The whole of these have a capacity greater than 70 to each lineal foot in breadth of exit.

#### THE SOCIETY OF ARCHITECTS.

THE first general meeting of the new Society of Architects was held in Exeter Hall on Tuesday. Few people were present, and there was some difficulty in carrying out the platform arrangements. Mr. C. O. Ellison delivered an address. They were, he said, making history. The society was founded to answer the ends indicated in the Marriage Service—for mutual help and comfort. If that end were not kept in view the society would be sure to fall like other societies under the domination of some narrow clique, and possess the faults without the strength of a trades' union. Jealousy of each other should be avoided, and *esprit de corps* cultivated. This was impressed on him by the success of the Reserve Forces. The world was made up of a mixed lot of people, but they all wished their work to be done by practical men. The admission of amateurs who had taken up architecture and archaeology as an amusement, was to be avoided. Among the subjects to be avoided in discussion was the payment of architects. There was an Institute scale; but in a case of difficulty like that which arose to the speaker in the Isle of Man, no aid would be given by the Institute. A revised form of building contract was worth preparation and discussion. It often happened that the practice in the provinces was misunderstood in London. The responsibility of the architect was another subject worth their consideration. A third was the relation between an architect and public bodies. It was a growing tendency to lessen his authority over his works, while making him responsible for them, treating him as a necessary evil that required to be checked by means of a clerk of works. The ownership of drawings was also a subject that needed treatment. It would also be well to appoint a standing committee to examine and report upon new materials and inventions. A certificate from them would be more prized than medals, certificates, and awards. Exhibitions of materials and inventions could also be organised by the society. Work of this class should be made self-supporting and employed to increase the income. Conferences might be held in connection with exhibitions. Advantage should be taken of the proposed Plumbers' Conference to hold an exhibition of appliances and novelties connected with the trade. In course of time the society might aspire to be recognised as the representative body of the profession, a position which was not attained by the Institute. But that result was impossible without the aid of the country members, and Mr. Ellison suggested that the closing meeting of the session should be held in Liverpool.

## NOTES AND COMMENTS.

THE proposal for the erection of a cathedral in Liverpool has given rise from the first to much opposition. There has been none of that unanimity which so important a work should secure to itself. The selection of a style for the building and the arrangements for the architectural competition do not indicate much insight in the ruling body. The site has always been a vexed question, and we should not be surprised if it caused the wreck of the project. The objections to it are manifold. The area is too limited to allow of the erection of a large building, and from its position any church standing upon it will have to sustain a comparison with ELMES' St. George's Hall. It is hardly wise to have the Battle of the Styles once more fought over a church. Liverpool has the reputation of possessing clear-headed men of business, and a proportion of them must be represented on the Cathedral Committee. But in their choice of a site they have displayed very little sagacity, and the high-handed proceedings of a few members in making the arrangements are likely to deprive the cathedral of many of its most zealous promoters. All things considered, it would be well to allow the project to lie in abeyance for a year or two.

THE Ecclesiastical Dilapidations Act generally is heard about at diocesan conferences. On Wednesday, at Leeds, the following resolutions were adopted by the clergy of the diocese of Ripon:—"That in the opinion of this conference the Ecclesiastical Dilapidations Act of 1871 needs amendment in the following particulars, which resolution they beg to forward to the Central Council of Diocesan Conferences, in accordance with their request:—(1) That there should be a clear legal definition of the term 'dilapidations,' distinguishing between landlords' and tenants' repairs. (2) That in a benefice coming for the first time under the Act of 1871, and where the incumbent had been instituted prior to that date, half the landlord's repairs be paid for out of a loan from Queen Anne's Bounty. (3) That the ingoing or outgoing incumbent, either or both, should have power to appoint a surveyor, to act with the diocesan surveyor, and to call in, if necessary, an umpire. (4) That the responsibility of recovering the sum assessed for dilapidations should be removed from the incoming incumbent." The effect of the resolutions would be an increased employment of architectural surveyors, but the additional cost that would be entailed may have been overlooked.

THE position which architects hold in France is indicated by the constitution of the juries for the exhibition of decorative art, which is open in the Palais d'Industrie in the Champs Elysées. The president of the jury on stone is M. CHARLES GARNIER, the architect of the Opera House; and one of the vice-presidents of the jury on designs is M. MAGNE. In the group of "bois de construction" the president is M. QUESTEL, and the vice-president M. CRÉPINET. Another characteristic of the juries is the appointment of well-known art critics like M. BAZIRE and M. PAUL ARÈNE to be members.

THE vestry of the parish of St. Pancras have selected six designs out of the large number submitted in the competition for the mortuary and coroner's court. It is, however, anticipated that there will be a long delay before there is a final selection of a design, owing to difficulties in respect of the site. It was originally intended to use a part of the churchyard, but, owing to the Act which was passed lately, any interference with a metropolitan burial-ground becomes illegal. The vestry have therefore to choose a site as well as a design for the mortuary.

IN spite of the value which is attached to the slightest work by J. W. MALLARD TURNER, it is well known that there are water-colours and oil paintings by him of which the present positions have not been ascertained. A Mr. MOORE, a hair-dresser in Exeter, has been fortunate in buying for a sovereign a-piece three water-colour drawings, which Mr. RUSKIN believes to be genuine works by TURNER. The broker who possessed them had paid fifteen shillings for three! They belonged at one time to Dr. HARRIS, who was secretary of a

local society of amateurs. The drawings are uniform in size, and measure 36 inches by 24 inches, and all depict Exeter Cathedral. One shows the north transept, another the west end, and the central part of the building is seen in the third. How the drawings could be allowed to remain so long unnoticed in a cathedral town which has an art society, and is often visited by artists, is a mystery, but the annals of picture dealing are full of cases of this kind.

ONE of the most interesting questions in construction is whether concrete will serve in all cases as well as stone or brick. For indoor work there seems to be little doubt about the suitability of concrete; but for work that is exposed to the action of the atmosphere or of water there is less certainty. We have heard that the Metropolitan District Railway Company propose to remove some walls along the line which have been built in concrete, and to substitute brick walls. On the other hand, the Trustees of the Clyde Navigation propose to use the material in a position that a few years ago would be considered hazardous. A new graving dock is about to be constructed at a cost of about 80,000*l.*, and in it concrete is to take the place of granite in the bottom and "altars." It has been found that in the Liverpool docks concrete answers well. At first the engineer of the Clyde Trust, while professing his willingness to carry out the instructions of the Trustees, declined to accept the responsibility of employing concrete, which was only 2,000*l.* less than granite in cost. But, after making experiments, he has come to the conclusion that a graving dock which is perfectly watertight can be constructed with the material.

THE programme of the winter session of the Edinburgh Philosophical Institution contains some items of interest. Mr. HUBERT HERKOMER, A.R.A., will deliver two lectures on "Conventionality and Proportion in Art," and "Notoriety in Art"; Mr. R. W. COCHRAN-PATRICK, M.P., has taken "The Progress and Prospects of Scottish Archaeology" for his subject; while Dr. CLARK, the Sheriff of Lanarkshire, will deal with "Glasgow, Past and Present," in two lectures. "Archæology is also more or less connected with Professor MILLIGAN's lectures on "WYCLIF and his Work," and Dr. STORY's on "Scotland in the Days of ANDREW MELVILLE and ALEXANDER HENDERSON." "Æsthetics will not be neglected, as Professor KNIGHT will give two lectures on "Empiricism and Idealism in Literature, Art, and Life." The session will commence on November 7.

THE *Architect* may claim the credit of suggesting the advantage of photographing drawings and engravings in public collections, and of demonstrating the possibility of producing copies that for purposes of study were equal to the original. The Library Association has now given its aid in furtherance of similar experiments, and at the meeting in Dublin it was unanimously resolved "That a memorial be presented to Her Majesty's Government urging the great necessity of making, by means of photography, copies of parish registries and other important documents whether printed or manuscript; books, pamphlets, &c., in public libraries, in order that the public might be secured from the serious consequences of the loss of such documents, &c.; and further, may be supplied with copies of the same at a reasonable price." While we are glad to see our example followed, it should be noted that the authorities of museums have not hitherto been able to publish copies at a price which the public will consider reasonable. Nothing has been done to compare in cheapness with the plates after the great masters which appeared in this Journal.

THE Edinburgh Museum has secured a collection of about five hundred examples of rubbings of monumental brasses. They had been prepared by the late Miss HILL, of Southampton. The majority of them are on paper which in colour is suggestive of the original grounds, and, consequently, they are more effective than the ordinary rubbings on white paper. How the paper was coloured has not been described. The reproductions, which are all taken from English examples, are likely to prove attractive in Edinburgh, owing to the scarcity of brasses in Scottish churches.

THE CALEDONIAN RAILWAY CENTRAL STATION HOTEL, GLASGOW.

THIS hotel, which was opened on June 18 of last year, is at the Caledonian Railway terminus, Gordon Street, Glasgow, and takes up about 216 feet of frontage to Gordon Street, and about 302 feet to Hope Street. The tower forming the intersection of the two façades is about 205 feet in height. The main entrance to the station is from Gordon Street, and each of the seven arches may be open or shut, to suit the convenience of the traffic. The booking-hall and office, parcels' offices, and waiting, &c., rooms, are all conveniently arranged on this side, the Hope Street ground-floor being entirely taken up by the grand entrance-hall, passenger and luggage lifts, and grand staircase, which is built of marble, and takes up the whole area of the tower; also first and second-class restaurants and large smoking-room, with necessary lavatory, &c., attached. The kitchens, which are fitted up by BENHAM, of London, are conveniently situated, and have hand and hydraulic lifts connecting them with service and still-rooms, conveniently placed on the different floors. Extensive wine and beer cellars are placed in the vaults underneath the station platform, wherein also are the engine-room, boiler-house, accumulator, &c. The heating, which is by Mr. POTTER, of London, is by hot-water circulation. The electric bells and speaking-tubes throughout were fitted up by Mr. HUTCHESON, of Glasgow. Messrs. GALBRAITH & WINTON, of Glasgow, did the marble-work, and Mr. EBNER, of London, the mosaic floors. The general contractors were Messrs. WATT & WILSON, of Glasgow, and the clerk of works Mr. GEORGE KERMACK. The whole of the works were carried out under the direction of the architect, Mr. R. ROWAND ANDERSON, LL.D., of Edinburgh. The drawing, of which the illustration is a reproduction, was exhibited this year at the Royal Academy.

DESIGN FOR THE ADMIRALTY AND WAR OFFICES.

WE publish this week the design by Mr. THOMAS PORTER, architect, and next week we intend to give the last of the nine designs which formed the second competition.

## THE REREDOS IN YORK MINSTER.

DURING the last few weeks workmen have been busily engaged in decorating the reredos in the choir of York Minster, erected to the memory of the late Mrs. Markham. The reredos, as it has hitherto existed, has been incomplete through want of funds, and the late Mr. Street contemplated the colouring and gilding of it in the same rich manner as that employed in the splendid examples of Spain and Germany, of which style of decoration we still possess at home beautiful specimens in the Mediæval retables preserved at Norwich Cathedral and Westminster Abbey, and in the sumptuous screen-work of the churches in Norfolk and Devonshire. Through the liberality of the Hon. Mrs. Meynell Ingram, the scheme of decoration originally intended by Mr. Street is being carried out, under the superintendence of Messrs. Bodley & Garner, the architects to the Minster. The original elevation of the reredos having proved too low for its position in the choir of the Minster, it has been raised by the addition of a richly-carved retable or panel, with emblems of Our Lord's passion and the sacred monogram. The upper portion has been also enriched by the addition of a carved cresting and by bosses to the ends of the cross. Care, however, has been taken, while raising it sufficiently to break the line of the stone altar screen, to interfere as little as possible with the view of the window beyond. The design of the altar-piece consists of a panel modelled in terra-cotta by Mr. Tinworth, the subject of which is the Crucifixion. This panel is framed by a rich composition of niches, and tabernacle work carved in oak. The effect of the dull red colours of the terra-cotta panel and the new oak has hitherto been extremely harsh and disagreeable. This, however, has been entirely removed by the central panel being painted a delicately-toned ivory-white, relieved, according to ancient precedent, with a little gilding; while the woodwork has been coloured a deep red, enriched with gold. The entire scheme of decoration produces a very rich and harmonious effect. The wings on either side have been painted and gilded in a similar manner, the upper panels bearing scrolls, that on the north side containing the words, "Tu es Christus filius Dei vivi," and that on the south the inscription, "Sic Deus dilexit mundum. Alleluia." The lower panels have been enriched with two half-figures of angels on each side bearing shields, which are being treated in the same style of colouring as the large panel. These figures have been executed in oak by Mr. Milburn, of York. He is also engaged in

carving standing figures of angels holding scrolls, which will fill the six small niches on either side of the metal cross. These will also be similarly coloured, so as to recall the ivory and gold treatment of the central panel, and distribute the effect thereof in other parts of the reredos. An illuminated scroll has also been introduced with good effect immediately above the central canopy, containing the words specially applicable to the beautiful representation of the Crucifixion beneath, by Mr. Tinworth, viz., "Agnus Dei, qui tollis peccata mundi, miserere nobis." It is also intended to add a short Latin inscription on the south end of the reredos expressing the time and the object of its erection. The whole scheme of completion and decoration has been thoroughly and carefully considered and worked out with the greatest care by the architects and those employed by them, and, when completed, the reredos of York Minster will be one of the most stately and magnificent in the kingdom. It is expected the reredos will be finally completed and the canvas screen removed in about a fortnight.

## EXCAVATIONS IN GREECE.

EXCAVATIONS are being carried on with great activity and more or less success in various parts of Greece. Upon the site of the Temple of Asclepios, at Epidauros, and upon that of the Amphiareion, at Oropos, in Attica, the diggings, which have been going on simultaneously for some time past, have resulted in the discovery of numerous pieces of sculpture and inscriptions of value. The excavations begun several years ago on the site of the Temple of Eleusis have been resumed after a considerable pause. In all these cases the work is conducted by the Archæological Society of Athens. The Greek Government, on the other hand, has taken up a very extensive and important task in Athens itself, where it is engaged in thoroughly examining the Acropolis. Two years ago a portion of the ancient citadel, lying to the south-east of the Parthenon, was cleared by order of the Ephor, M. Eostratiades, and resulted in the discovery of numerous very beautiful and remarkable monuments and remains of ancient Attic art. It was accordingly determined thoroughly to explore the entire site of the Acropolis. The work has been begun by the new Ephor, M. Stamatakis, on a large scale, and already a considerable portion of the Mediæval and Turkish fortifications surrounding and disfiguring the hill have been demolished and removed. The appointment of M. Stamatakis as Ephor-General of the antiquities of the kingdom of Greece is the best guarantee that this important work will be carefully and thoroughly executed. For many years past the new superintendent has distinguished himself by his labours in bringing to light and preserving antiquities in all parts of Greece. The practical direction of the work of demolition and excavation has been entrusted to Dr. Dorpfeld, a German architect, who is well known for his labours in connection with Dr. Schliemann.

A paper on his discoveries at Tiryns was lately read by Dr. Schliemann at Breslau. In the course of it he said that the heyday and the great doings of Tiryns belong to a distant pre-historic epoch. Even at Homer's time the town was of high antiquity, deprived of its independence long ago, and a vassal of Argos. Researches have proved that the palace of the ancient Tirynthian kings, which occupies the whole upper citadel, had already been destroyed during a period which lies before the ken of historical record. Its ruins were hidden in a mound of rubbish, its building site had remained uninhabited, and the old castle lay waste and deserted in the midst of the small lower town which surrounded it. Dr. Schliemann during his excavations at Tiryns has come upon remnants of a house even older than the pre-historic palace. It lay about five mètres deep below the floor of the upper castle. The monochromous hand-made pottery he found in a room filled with red-brick refuse and charcoal, proved to be completely similar to that which he had discovered in the two oldest cities of Troy. Pre-historic settlement thus preceded pre-historic settlement at Tiryns. Dr. Schliemann proposes to undertake exploration in Crete.

## LUDLOW CHURCH TOWER.

THE following report on the present condition of the tower of St. Lawrence Church, Ludlow, by Mr. A. W. Blomfield, M.A., has been read at a meeting of the vestry:—I have made a careful inspection of the tower of Ludlow church, for which purpose a platform has been placed immediately below the windows of the lantern. Without this it was impossible to examine certain points with sufficient minuteness. I have now to report that the tower cannot be considered to be in a dangerous state in point of stability. On the other hand, its condition is very far from satisfactory. The walls of the lantern and the two next stages are full of cracks, most of which are no doubt old, although many show unmistakable signs of movement and extension, thus giving evidence that a sure though gradual process of dilapidation is going on, which, if not arrested ere it is too late, must ultimately cause the ruin of the fabric. The decay of the external stonework is a

more serious matter than would at first sight appear, or than it is in ordinary cases. The walls are pierced with such large openings and so deeply moulded that any loss of strength on the external face, by the disintegration of the stone, affects the general stability of the tower very materially. The weakest point of the tower is the south-west angle, which is also most exposed to the corroding effect of the weather. The north-west angle shows similar signs of weakness, though in a less degree. The whole of the west side of the tower appears to have got out a little towards the west, while the other faces remain upright. This movement no doubt began at a very early period in the history of the building. It is easily observable that the two first columns on each side of the nave lean toward the west under the pressure brought to bear on the nave arcade by the thrust of the great arches of the tower. The effect of such a movement would be to produce all the more serious cracks observable. The ringing of the bells and the pressure of exceptionally high winds on the great height of the tower would cause an oscillation of the whole fabric, constantly tending to extend these cracks and cause new ones, and as the external face becomes more disintegrated by the weather this tendency will continue to increase. Having mentioned the bells, I will add that there are some points in the method of hanging which appear open to objections, and which probably increase the bad effect of the ringing on the fabric. I believe that which I have now stated is a true account of the condition of the tower and the causes of it. There is no immediate danger, nor any present cause for apprehension, and I am of opinion that if the ringing of the bells is suspended, and they are only chimed, many years may elapse before any serious increase in the present defect is observable. The decay of the exterior must, however go on, and, unless stopped, must in time render the tower unsafe. The method hitherto employed of putting in iron cramps here and there across the cracks is, in my judgment, a very bad one, and anything of the kind would be worse than useless, and a simple waste of money. The refacing of the whole tower will have to be undertaken sooner or later if it is to be preserved at all, and there can be no doubt that the sooner it is done the better for the building, and the less the expense. If, however, the cost, which I should roughly estimate at about 6,000*l.*, precludes the possibility of doing it at present, I should advise its being left as it is, simply taking the precaution of stopping the ringing over of the bells. The refacing of the tower would of course include the complete reinstatement of all decayed and defective parts within and without, the removal of all iron cramps, the insertion of long boulders of hard stone, and generally the strengthening of the tower in such a manner as to render it sound for hundreds of years to come, while at the same time no part of the old work which could be retained with due regard to sound construction and durability would be discarded to make way for new work.

## EXTENSION OF THE BRADFORD TOWN HALL.

THE designs by Messrs. W. & R. Mawson for the enlargement of the Town Hall in Bradford (which was also designed by them) have been approved by the Corporation. The extension will provide accommodation for many years to come in the municipal, magisterial, &c., and educational departments. The appearance of the Town Hall will be improved by the amplitude which it will gain. It is proposed to allot to the various departments rooms contiguous to each other, the Town Clerk's offices, the Borough Surveyor's offices, the Waterworks Engineer's rooms, and the Gas Engineer's offices being all arranged upon the same floor. A room will also be available for the meetings of the Finance and General Purposes Committee. Another advantage of the new scheme is the provision of a subsidiary court, which, opening into a large central hall, will form a reception-room worthy of such a building.

The site of the extension will be triangular. The ground plan shows that a portion of Chapel Lane will be absorbed, and will become an interior court. At each end there will be an archway, above which will run the corridors connecting the extension with the present Town Hall. On each side of the new building there will be a street 60 feet in width, and at the end nearest to Union Street an open space of 30 yards. It is proposed to place the gas and rate offices on the ground floor at the end of the building. They will have a separate entrance, and will be lighted on the three sides by large open windows and an interior dome. The rooms of the present Town Hall on the ground floor are only 12 feet high, but it is intended that all the rooms on the ground floor of the extension shall be 20 feet high. On each side of the new building there will be a large staircase, one called the Court Staircase, the other the School Board Staircase, each having its own entrance. All the rooms connected with the administrative department of the School Board will be on this, the ground floor, raised above the pavement only about 6 inches. The School Board entrance will be from the contemplated new street. The School Board rooms have been so arranged that those which are occupied by offices frequented by the public are all on the ground-floor. The new gas and rate office will be 80 feet long by

65 feet wide, with private rooms, safes, &c. The public entrance to the gas and rate office will have double doors, which will all be the passage of an inward and outward stream of callers. There will be a counter for the public, 64 feet long, divided into a series of sections, each devoted to some special business in connection with the work of the office. Contiguous to the entrance to that portion of the ground-floor set apart for the purpose of the School Board is a waiting-room, 31 feet by 13 feet, out of which open offices for the superintendent's officers, and the inquiry-room, each 15 feet 6 inches by 22 feet. Adjoining these is the room for the school attendance officers, which is 46 feet long by 20 feet wide, and lighted by four large three-lighted windows. Next to this room, and opening out of it, and approached from the same corridor, is the examination-room, 35 feet long by 20 feet wide. Each of these rooms has two large fireplaces, and they will also be heated with hot water. Adjoining these rooms are others for the lady superintendent, the superintendent's room, and the clerks' offices. A room is provided for packing and stores, 32 feet by 16 feet. Large lavatories and cloak-rooms, lighted by open lights, are provided for the whole of this department. There is also provided on this floor a door leading into a serving-room, with servants' stairs, so that everything required for the central hall on such an occasion as a banquet can be brought in here, and very rapidly sent up to the kitchen on the top floor. For bringing prisoners from the cells on the present Town Hall premises to the Subsidiary Court, the staircase which is now used chiefly to give access to the Borough Coroner's Court will be employed, and the Coroner's Court will be removed to the new building.

One prominent feature in the arrangements of the first floor must be noted, viz., that the corridor which runs round the first floor of the present Town Hall will be continued round the entire of the first floor of the new building. Thus, a person entering the Town Hall by the main entrance, and turning to his left by the corridor till he comes to the corner room which is used by the borough magistrates, may then face about and traverse the side of the building which he is then on till he reaches the apex of the triangle which the Town Hall and the extended portion may be said to form, and then wheeling, he may return by the corridor on the other side of the building till he reaches the other extremity of the base of the triangle. In this way easy access is given to all the offices in both buildings. The corridors in the extension will, however, be 8 feet wide, or 2 feet in excess of the width of the corridors in the older building. Their level will be slightly higher than that of the Town Hall corridors, and leading to them from the latter will be a gentle flight of steps. The accommodation assigned to the School Board, on the first floor, consists of the Board-room, the clerk's office, the general office, the pay office, and committee-rooms. The Board-room extends across the end of the building, at the apex of the triangle. It is 60 feet long by 24 feet wide, and is lighted by eight two-lighted windows. In connection with it is the clerk to the Board's office, 23 feet long by 16 feet wide, and close to the Board-room and to the staircase is the general office, which is 33 feet by 23 feet; while on the other side of the staircase are the pay office and three committee-rooms. The Subsidiary Court and the central hall may be described as the kernel of the new building. They are in the middle of it, and surrounded on all sides by the various offices, but are yet directly open to staircase and corridor. The Subsidiary Court is 46 feet long by 32 feet wide, and has a lantern light. Immediately adjoining it is the central hall, which has a length of 64 feet, and is 30 feet wide, having retiring-rooms in connection with it. It is proposed to arrange the Subsidiary Court with movable fittings, except in that part occupied by the magistrates. The removal of the screen will separate the court from the central hall, and make the two rooms into one large chamber. The need of so much accommodation has been much felt, successive mayors having been compelled to entertain guests in batches for want of one room in which to entertain all together. The central hall will also be fitted with a temporary platform so as to make it suitable either alone or in conjunction with the Subsidiary Court as a meeting-room.

On the second floor of the new building it is proposed to place the Coroner's Court, a room 31 feet by 27 feet 9 inches, with a private room attached. There will also be a large apartment on this floor, to be used as a law library, having a length of 60 feet and a width of 24 feet. On this floor also will be offices in which part of the municipal work of the Town Hall, where the accommodation is becoming daily more and more inadequate, will be carried on. The plan of this floor also shows a balcony at each end of the central hall.

One great advantage in connection with the new building will be the fact that the rooms on the outside, instead of being 18 feet or 16 feet wide, as the rooms in the old building are, will be 20 feet wide. There will be a similar improvement in the matter of height, all the floors being higher than those of the Town Hall. There will be no cellar or subway accommodation, as this could not have been provided without interfering with the drain, gas, and water pipes which already lie under part of the site to be covered by the new building.

The elevation is designed upon the same lines as the present Town Hall, while the additional loftiness has enabled the architects to give greater height and width to the window openings. On

each side of the building will be a central feature, consisting of the main staircase, terminating in a large turret, and equidistant on each side from the central figure are two gables corresponding with the present west gable of the Town Hall. The ground-floor windows are square-headed and lofty. The first-floor windows are pointed with simple circular tracery, and the second-floor windows correspond with those of the present Town Hall, but are loftier and wider. The doorways are pointed, and it may be noted that for the public convenience they will have prominent notices attached to them, showing to which departments they lead. The general effect of the elevation is to harmonise as closely as the additional height of the building will allow with the present municipal buildings, and the grouping formed by the conjunction of the two similar buildings will immensely enhance the architectural appearance of the present Town Hall, which will become now the handsome front of a structure which will on each of its three sides present a facing of considerable beauty and solidity. The materials and details of construction will be practically the same as those of the present building. It may be remarked that the interior courts which will be provided will afford not only capital light through the building, but a far freer ventilation than would have been otherwise present. The size of the new building in cubic measurement will be 1,036,216 feet. With a cost per foot at the same rate as that for which the Town Hall was built the expenditure on the extension scheme would be 36,700*l.*, but building being now very much cheaper, and considering the somewhat plainer exterior and more economically-devised interior, it is estimated that the outlay on the new buildings will be limited to 30,000*l.* The Bradford School Board will occupy about one-third of the whole flooring accommodation afforded by the new buildings.

### THE CONDITION OF IRISH TOWNS.

A PAPER was read at the Sanitary Congress in Dublin by Surgeon-Major J. Wycliffe Jones on "The Insanitary State of small Irish Towns." The author said:—

The deplorable insanitary condition of several small Irish towns, in which, during various periods of my service at home, it has been my lot to be stationed in medical charge of Her Majesty's troops, has impressed me so forcibly that I feel moved to submit a brief paper upon the subject to the Congress. I feel strongly convinced that the death-rate must be high in many towns I have known; yet upon an examination of the statistics of the area into which such towns were collated I have been astonished to discover a very low rate of sickness and death. This statistical imperfection has a further important bearing. I cannot in justice condemn the condition of things in any one town as exceeding, in evil case, those of any other; for, again, I am unable to prove my case. For instance, although the insanitary state of Naas, my present station, is so bad, so deplorably bad, that every essential for healthy life is absent, I cannot state from personal observation, nor can I prove by figures, that its condition is in any degree worse than that of many other towns I have formerly resided in. A traveller on foot approaching an Irish country town, who, forsaking the high road, takes the field paths, will be much struck by the numerous little groups of workmen who meet or overtake him, as the case may be, all wending their weary way towards the one goal—the town. These are farm labourers who have walked out two to four miles to their work in the early morn, and are now—having neither lot nor part in the land upon which they have expended a day's toil—plodding their way home—to what kind of a home we shall see anon. A time there was, as I am informed, when these men, their wives and children, resided in the country, surrounded by a bright atmosphere of rural industry and humble plenty. This no longer obtains, and so rural families who have not emigrated are compelled to seek shelter in the nearest town, in which they are shamefully ill-lodged, and where they too often must submit to extortion; and further, where, from the want of employment, idle and many vicious habits are quickly learned.

I will endeavour to describe a small court of dwellings very recently visited. The entrance is in a narrow lane of cabins, and this opens to the main street of the town. Picture then a horrible little courtyard some 50 feet by 28 feet almost completely enclosed by small dwellings; the ash-pits, pigstyes, and backyards of the front row of hovels forming the only prospect possible for those inside the court. The entire block of buildings does not occupy, to the best of my judgment, nearly one rood of land, nay, indeed, the one-sixth of an acre. Upon this site are built thirteen simply frightful dens, all have damp or clay floors, pools of green and black water lie all around, black typhoid mud, and festering manure in abundance. Some fifty-five to sixty souls live in this court, and many pigs are kept. I measured several, and append a few results. No. 1 house, 5'7 by 14'2 by 6'9 equal cubic feet less than 588; four souls live here. No. 2, 15'7 by 12 by 9'6 equal cubic feet less than 1,800; five souls resident. No. 3, 15'7 by 10'8 by 9'6 equal cubic feet less than 1,500, and eight souls resident. In the first about 100 cubic feet of foul damp air could be enjoyed, in the second about 300, if no lodgers come for the night, in the third about 142. For the worst description of dwelling 15. to

15. 6*d.* per week is paid, but 2*s.* 6*d.*, 2*s.* 8*d.*, and 3*s.* is very commonly demanded even for cabins, which can, with truth, be described as "unfit for human habitation."

A very wide field of observation, both in Europe and in India, has not furnished me with any parallel to all this. In no country on the globe has human misery reached so low a degree of degradation. Picture what life must be in such dwellings, and be well assured that I furnish no isolated instance, but a true representation of what is all but universal in Irish country towns. The worst dwellings are to be found in towns owned by a number of small proprietors. In these, sub-letting of even fairly good houses is carried to a ludicrous degree. A bachelor friend of mine once obtained with difficulty in a small country town two furnished rooms in the same house; but he rented his sitting-room from one landlord and his bedroom from another. Again, in the instance mentioned of the house in which I found twenty-two souls, two or three landlords were part owners, and the third, *i.e.*, who occupied one room (himself and family), drew 8*s.* 6*d.* per week from three sets of squalid lodgers. The house pays to various owners about 34*l.* a year when quite full. I would be sorry to give that sum for the materials of which it is built. With such surroundings no one will marvel to hear that excessive drinking is too often practised in Irish towns by those housed as described; indeed, poverty or want of credit are the only checks to this vice, and it is so notorious and deplorable as to need no further notice. I fear being an undue trespasser upon your notice and time, and I, therefore, conclude with an earnest desire that a root and branch reform may ere long be applied to this wide-spread and destructive evil.

Sir R. Rawlinson said that he had come across in the course of his inspection parallel cases in Great Britain to those which were mentioned in this paper. The condition of affairs in England and Scotland, he was sorry to say, was not very different to that of Ireland. In Dublin the merchants and better classes of the population had removed into the country. The consequence was that their houses which were admirably built degenerated into tenement houses. They were divided and subdivided, and in time the windows were broken, the water supply became defective, and the sanitary arrangements were neglected.

Dr. Carpenter said that the duty of owners of land was to look after the abodes of the people. The landlord who allowed the cottages and rooms of his tenants to be in the condition which had been described in the paper was certainly failing in his duty to his country, to himself, and to everybody. The way in which mischief arose from houses being left in the condition which had been described in the paper struck the landlord eventually with a dead certainty. There could be little doubt that from time to time the establishment of the owner was occasionally visited by an arrow which had come from one of these cabins, whether from a near or great distance. If the owners of property did not provide better houses for the poor people to live in they would be unable some day to stem the tide of mischief which would arise from this cause, and which would sooner or later strike themselves home.

Surgeon-Major Hamilton said that the accommodation which was provided for soldiers and their families was in many barracks entirely inadequate. He had seen eight human beings—father, mother, and children—obliged to sleep, dress, and live in one small room in Portobello Barracks. Even this was an improvement upon the condition of affairs which had existed at Chatham some years ago, for whilst there he had seen as many as eighteen families living in one room only divided from each other by partitions made of sheets hung up between each.

The Hon. Henry Bruen said that he did not think that the state of affairs which had been described in the paper was universal in Ireland. They were all aware that Parliament had made provisions enabling owners to borrow money for the erection of labourers' cottages, and he thought these provisions should be made applicable to towns as well as country parts. The cases which had been cited he believed were isolated cases.

Surgeon-Major Jones replied, and said that he had always found that in cases where villages were owned by landlords, they were in a better condition, from a sanitary point of view, than if they were in the hands of small owners.

### BUILDING IN GLASGOW.

A MEETING of the Glasgow Dean of Guild Court was held a few days ago, and as it was the last prior to the annual election of the members the Lord Dean followed the practice of the Court by giving an abstract of the business which had been brought before him during the year. His Lordship said:—The linings that have been granted are 224, of an estimated value of 697,005*l.*, the largest amount since 1874, when it was 755,717*l.* These figures, when first looked at, seemed to indicate returning prosperity, but when closely examined they are not so satisfactory, as nearly half the amount is represented by Corporation buildings, churches, and schools, and these may be termed dead or unproductive investments, only giving indication of increased taxation, and not yielding a material return. If the work had

been required entirely by the wants of the population, I fear there would have been very little employment for the working classes, as only plans of 587 houses have been passed. Of these, 97 houses are of one apartment, 258 of two, 196 of three, and only 2 houses of five, and none above this. The eastern and northern districts show the smallest increase. It may be interesting to note that during the last seven years the value of the buildings approved by this Court was 3,521,395 $\frac{1}{2}$ ., and the number of dwelling-houses 3,935, and each year seems to point to a smaller class of house being required. This fact should have the attention of our municipal authorities, as taxation is thus falling year by year more proportionally upon the working classes, and this is likely to increase, as, owing to the use of the telephone and other causes, large warehouses are being removed outside the municipality, and only small places retained for showing samples.

### EASTBOURNE MUNICIPAL BUILDINGS.

ON Thursday the memorial-stone of the new Town Hall and Municipal Buildings in Eastbourne was laid by Lord Edward Cavendish, M.P. The site, which has an extensive frontage, is situate in Grange Road, and is peculiar, inasmuch as four thoroughfares meet there, and for several reasons it was thought best to place the buildings, which are some 200 feet in length, longitudinally and parallel with the line of frontage.

The design is an adaptation of the Renaissance style of architecture, the materials used for all the elevations being best dark red brick, with a liberal use of Portland stone dressings. The roofs will be covered with Westmoreland green slates, the cresting and roof terminations being of ornamental ironwork; the glazing of the windows will include where desirable specially designed stained glass.

The main entrance is beneath the tower, and will be approached by a handsome stone open portico and flights of steps returned at the sides. The tower will rise to a height of 130 feet above the general level, and provision is made therein for a set of Cambridge chimes, and a clock having four faces, illuminated at night.

The ground floor on the one side provides for a police or county court 48 feet by 28 feet, and 23 feet in height, with ample approaches, large general waiting-hall, female witnesses-room, barristers and solicitors' retiring-room, magistrates clerk's room, county court offices, and also a judge and magistrate's retiring-room, with ante communicating direct with the court and Bench. The basement of the court is occupied by the police offices. In a main longitudinal corridor are the accountants', rate-collectors', and inspector of nuisances', and the medical officers' room. The principal entrance gives access to the grand staircase hall, 32 feet by 21 feet 6 inches, and which rises to a height of 33 feet, having marble pilasters and enriched ceiling, and in the rear of the grand staircase are the public cloak-rooms and lavatories. The remainder of the ground floor comprises a large committee-room, an open area, a lift, the borough and building surveyors' offices, with side entrance. There are also a suite of spare offices, and caretaker's department. A public mortuary will be placed in the rear of the buildings.

On the first or principal floor is the town hall, approached from the principal staircase landing at one end, and also by a secondary staircase with retiring-rooms at the platform end. The hall is 83 feet long by a width of 45 feet, exclusive of orchestra, and it is 26 feet in height in the coved and enriched compartments of the ceiling, the walls between the windows having engaged marble pilasters and panelled dado, and the floor will be laid with oak. The windows are arranged on each side of the hall, and are recessed. From the principal landing, and from the town hall, doors communicate with the reception chamber, which is under the tower. This apartment is circular on plan, and 18 feet in diameter, by a height of 26 feet into a domed ceiling, which will be ribbed and enriched. The floor will be laid with parquet. There is also a mayor's parlour and ante, having a length of 35 feet by a width of 17 feet, and contiguous to these are the town clerk's offices and muniment-room. There is also a council chamber, 40 feet by 28 feet, with waiting, retiring, and robing rooms; and the council chamber will be panelled and laid with oak. Thus the chief civic apartments are *en suite* and on one floor. The upper portions of the buildings are devoted to spare offices and store-rooms.

The whole of the floors will be of fireproof construction, and all the joinery throughout is to be of wainscot oak. All the external walls, which are of very substantial thicknesses, are being built hollow, and tied with Jennings's vitrified brick ties. The walls of the basements are for the most part lined with best white glazed bricks. All the staircases will be of stone, and the corridors and passages will be laid with tiles; the walls of all lavatories, &c., being lined with the same material.

Special attention is being directed to the thorough ventilation of every apartment, and the latest improvements in that direction will be introduced; the heating, independently of the use of open fires, will be by means of hot water or steam.

The work is being carried out by Mr. James Peerless, contractor, of Eastbourne, and Mr. W. T. Vale, of London, is the clerk of works. It is expected that the buildings will be ready for occupation about Midsummer 1886, and the cost, exclusive of the site and furniture, will be upwards of 30,000 $\frac{1}{2}$ l. The architect is Mr. W. Tadman Foulkes, of 100 Colmore Row, Birmingham, whose original plans were selected for the first premium in a competition as far back as April 1880.

### HOMES OF THE WORKING CLASSES IN DUBLIN.\*

THE difficulties of dealing with the rehousing of the poor by general legislation are very great, owing to the diversities of conditions in different towns being such as to call for legislation of a local character. Among these may be mentioned the habits of the population; the development of various industries demanding space; schemes for railway improvements, selecting, where possible, poorer localities; movements of population out of towns to suburbs enjoying better-class houses. A more important difference perhaps is that between the growth of popular opinion on the subject in various towns. We have, on the one hand, the example of Glasgow, which twenty years ago recognised the evils caused by its then condition, and led the van in this great work; and, on the other, the case of an English town, where the local authority took preliminary steps under both Sir R. Cross's and Mr. Torrens's Acts, but abandoned them, notwithstanding the representations of their medical officers of health, and finally questioned the right of the Local Government Board to interfere in the matter. In 1871 there were, out of a total number of 58,327 families, 44,933, or 77 per cent., living in 10,954 tenement houses, being 4.1 families to each house—the term "tenement" being applied to all houses, of whatever size, accommodating more than one family. In 1881, out of 54,725 families, 39,997, or 73 per cent., lived in 9,854 tenement houses, or 4.05 families per house. The number of persons to each family had, however, increased from 4.2 in 1871 to 4.5 in 1881. Of 1,100 tenement houses which have disappeared, 1,053, occupied by 4,659 families, contained more than ten rooms, and from two to six families each. It is certain that this decrease would have been much larger but for the constant supply of first-class single houses, which have lapsed into tenement houses. The statistics also show that while the decrease of families of all classes amounted to 3,538, those occupying tenemental dwellings have decreased by 4,948, and that the difference represents 1,413 families who have advanced to single-house accommodation. On the whole, we have the broad fact that in 1871 77 per cent. of the families in Dublin, or 188,769 persons, lived in tenement houses, and that this proportion was only reduced to 73 per cent., or 182,278 persons, in 1881. With reference to the condition of these houses, it was sworn before the Royal Sanitary Commission in Dublin in 1879 that of 9,760 which then existed, 2,360 were unfit for human habitation, 3,500 were repairable, and 4,000 in better condition.

Compensation for trade disturbance is the most difficult question of all to deal with by general legislation, and the Select Committee could not see their way further on this point than to make a recommendation to arbitrators to consider well in all cases whether the trader has not the option of setting up his trade somewhere in the immediate neighbourhood without positive injury. While, on the one hand, there is no doubt that in Dublin many small traders, whose tenancies are monthly, and even weekly, have suffered hardship from compulsory removal without compensation, it is equally true that the small trader who gets moderate compensation for disturbance, and has the chance of setting up his business in any other district he likes, is much better off than the trader who lives across the street, gets no compensation, loses his business through the clearance of an area, and finds, when the area is re-peopled, that the new inhabitants are of a class quite different to that which patronised his wares. I know of several such instances in the Coombe area.

Having pointed out the improvements which have been made in the Act since the adoption of two schemes in Dublin, I may be permitted to urge the importance of taking fresh action. Although of the nine areas reported under the Act as unhealthy in 1876, five have been practically cleared, those remaining are in a much worse condition than then, and there are other areas for which there is no effective remedy but demolition and reconstruction. Believing that a large number of the richer inhabitants have no idea of the depths of misery, filth, and degradation in which a large proportion of the population exist, I append a description of Plunket Street area, kindly supplied to me by Mr. Harty, C.E., assistant engineer to the Corporation, who acts as surveyor to the Artisans' Dwelling Committee of that body:—"Accordingly as the houses in Plunket Street area were taken over by the Corporation for demolition, they were found to be in a shocking state. House

\* A paper by Mr. Edward Stanhope, M.A., read at the Congress of the Sanitary Institute in Dublin.

after house was in a most foul and filthy condition—which almost beggars description—and the stench through the houses was most intolerable from human filth, which was allowed to accumulate on the landings, stairs, floors, &c., and actually, when taking down the houses it was found that between the flooring-boards and ceilings underneath, filth and dirt of all sorts were packed so tightly as to become one solid mass; holes were cut in shop-floors so as to make a common privy, thus making the basement the receptacle of filth; floors in the drawing-rooms and top storeys were partly removed, so that there was actually no privacy in several of the rooms; filthy chaff-beds were found by me in several places emptied out on the floors, the inhabitants not taking the trouble to remove the rubbish into the back yards; the smell was so intolerable in some instances that I had to leave the houses quicker than I went in. In a great many of the houses, especially in Blackhall Row, old tubs, crocks, cans, and buckets were found filled with night soil, and hid away in the roof and other out-of-the-way places, the removal of which was anything but pleasant to the men. The workmen were often literally covered with fleas, &c., and had to run away from their work and scrape each other's clothes with sticks in order to remove them—the colour of their clothes was hardly discernible. Beds and furniture of the simplest kind were a luxury, unknown in several instances." Bad as is the condition of things as described here, it is not a bit worse than large portions of the poorer parts of London, where, for example, in a street containing 41 houses inhabited by costermongers, 40 privies are utilised as stables for the donkeys, and one is reserved for human beings.

Everyone who knows Dublin will be struck by the large number of abandoned houses to be seen in comparatively respectable streets, and will not fail to observe the gradual injury inflicted by the condition of such houses on the adjoining ones. A great number of these houses have been closed by the medical officer of health as unfit for human habitation, or by the surveyor as structurally dangerous. The great difficulty which would be met with in Dublin in carrying out proceedings under this Act is to fix the liability on the rightful owner. The definition of the word "owner" must be specially noted. He is any person who is enabled to sell land or premises, and all lessees or mortgagees except persons who are entitled to the rents and profits for a less period than twenty-one years. The value of this provision can best be appreciated when we consider that in the Coombe area the amount awarded to tenants, including costs, who held for less than twenty-one years was 1,980*l.* 19*s.* 2*d.*, or 12 per cent. of the entire award; and the justice of it will be apparent when it is remembered that a large proportion of tenement houses in Dublin is in the hands of those whose margin of gain is the difference between due regard for and gross violation of the laws of health and decency. There are a large number of courts and alleys in Dublin which would be greatly benefited by the removal of the buildings between them and the thoroughfares, which not only obstruct light and air, but cut off the inhabitants from the public gaze. In this way the richer inhabitants would be shown under what conditions so many of their poorer brethren live; and the occupants of these courts would gain from being under the eyes of their fellow-citizens.

The Labouring Classes Lodging Houses and Dwellings Act (Ireland), 1866, provides for the advance of public money by the Commissioners of Public Works in Ireland for the objects stated in the title of the Act, subject to certain conditions for the repayment of such loans. The period of repayment is limited to forty years as a maximum, and the rate of interest to 4 per cent. minimum. In 1883 the directors of the Dublin Artisans' Dwellings Company made a representation to Government, requesting that the periods of repayments should be extended to forty years, as in the Act of 1866, instancing the analogy of the Public Health (Ireland) Act, by which loans for sanitary purposes are granted at 3½ per cent., and the repayments spread over fifty years; and offering, in case the application was granted, to largely extend their operations. The request was, however, refused.

The greatest bar to the improvement of the homes of the working classes in Dublin is the present anomalous condition of the valuation of property. This affects not only the provision of such dwellings, but the improvement of every class of buildings. Passing to the houses of the working classes, and selecting at random seven tenement houses in various parts of the city, and seven improved dwellings, the valuation of each being the same, viz., 9*l.*, or 63*l.* for all, I find the annual rental of the old houses to be 322*l.*, of the new 118*l.* That is to say, the proprietors of the tenemental dwellings contribute 10 per cent. of their income to the rates, while the owners of the new dwellings pay 27 per cent. of their income to the rates. This inequality pressed on the very class we are supposed to be benefiting, as the following facts will show. I have investigated the present and former rents paid by 427 of the tenants of the Dublin Artisans' Dwellings Company, and find the present rent to average 5*s.* 3*d.* per week, the former rent 4*s.* 3*d.* Dividing these gross rents into the two items of "rent" and "taxes," and applying the proportion of taxes to rent given above, it will be seen that the "rent" of the new dwelling is 3*s.* 10*d.* and taxes 1*s.* 5*d.*; while the "rent" of the tenemental dwellings is 3*s.* 10*d.*, and taxes 5*d.*; it will be therefore seen that

the extra price which the tenant pays for the improved accommodation is made up entirely of increased taxation. If a revaluation were ordered, and the expense provided for (which can only be done by legislation), the effect would be, as far as Dublin is concerned, unequal and unjust. The valuation must be made according to unions or baronies, and the boundaries of these areas are not continuous with those of the municipal district. The result would be that if the city were revalued the new valuation would be much out of proportion with the existing valuations of the portions of the North and South Dublin Unions that are outside the city.

The number of tenement houses in Dublin is being constantly increased by the conversion of single dwellings, and diminished by natural decay, demolition, or by being closed for want of sanitary accommodation. Accommodation has been within a comparatively brief period provided, or is being provided, for 1,816 of the artisan and labouring class, and for 800 of a slightly superior class; in all, 2,616 families, representing about 16,000 persons. Although the necessity in Dublin for the demolition of old, substitution of new, and adaptation and maintenance of repairable dwellings is exceptionally great, it must be admitted that within the past few years special efforts have been made, both by the local authority and by public and private enterprise, to meet the necessity; and it is worthy of notice that Dublin is one of three cities in the United Kingdom which have carried out more than one improvement scheme under Sir R. Cross's Acts. And in dealing with the question it must always be borne in mind that a difference exists between "house" and "home," and the improvement of the homes of the working classes does not altogether depend on the provision of suitable abodes, but to a very great extent on the education of the classes themselves. While many of the working classes eagerly embrace the opportunity of improving their domestic condition, afforded by the provision of new dwellings, there is, as is natural, a great deal of ignorance, of prejudice, and of obstinacy to be met with, and there is a large population in Dublin whose opinions on the subject of improved dwellings may be indicated by the aspiration of the old woman who, after gazing on the rows of new cottages in the Coombe thoroughfares, exclaimed, "God be with the good old times when there was no knockers on the hall doors!"

### THE LION OF ST. MARK.

THE following account of the Lion which surmounts the column in the Piazzetta, Venice, appears in the American *Architect*, and is signed "Giacomo Boni." The figure was removed by Napoleon, and placed on the esplanade of the Invalides. It was brought back from Paris in 1815, was restored by the sculptor Bartolomeo Ferrari, and raised to the top of the column on April 17, 1817:—

On the morning of the 18th of September, 1883, the grass was to be extirpated from the summit of the columns of the Piazzetta. Two ladders had been joined together in order to reach the capitals, whose height from the ground surpasses fifteen mètres. I climbed up myself, and setting my foot upon the capital, the size of which is three mètres square, I felt myself small, so colossal seemed the lion, whose wings reach one and one-half times the height of a man. In order to accustom myself to the proportions of the lion, I went all around it. It is composed of several pieces held together by an iron framework, the bolts of which, oxidising, have moved or entirely forced off the copper sheets covering them. Two fragments of bronze, broken by the rusting of the iron, have fallen from under the stomach, showing that the cast is, more or less, one centimètre thick.

The pieces of which the lion is composed belong to different epochs. The most ancient ones are fortunately the most numerous, and belong to the time when the Doge Ziani erected these columns (1176). The others belong to subsequent renewals and the Napoleonic restorations, recognisable from the classicism of the modelling. The right fore-leg, half of the left one, half of the right hind-leg, and the foot of the left one are not original. It is a pity that not one of the original paws remains, because the present ones have not the sentiment of any epoch: they are of indifferent workmanship. Tufts of hair upon the head have been replaced. The book held under the fore-paws is of lead. The wings are not only detached from the other parts of the lion, but they belong evidently to a recent period; however, there were wings before, of which some traces are left, which we will notice later. The tail has also been restored.

All the rest, that is to say the head, the mane, and the body, is original. The modelling of some parts, where the ancient Venetian *aurifex* thought proper to take special care of it, is really perfect. In order to convince one's self of it, it would be sufficient to note the muscles, sinews, and veins of the paws not wholly restored or renewed. There is not any ostentation or affectation of anatomical knowledge; the artist has only indicated what contributes to the majesty of a symbolical animal.

On seizing the jaws of the lion and looking into his mouth, I perceived the whole internal cavity. The jaws are armed with canine and molar teeth of most accurate workmanship; the skin is drawn into ridges, and conveys the impression that it is covered

with hair at the sides of the mouth, which, when seen closely, loses completely its grotesque grimace. A pair of whiskers, grooved from single pieces, represents the long bristles of the feline species. The eye-sockets are strongly marked; the brows are muscular and rounded. The eyes seem of a glassy substance, which is white and cut into triangular facets; the right eye sends from the bottom reddish reflections; they are a restoration, and are said to be of rock crystal, but they have not its transparency. The old guide-books do not mention the colour which they had before; certainly they were not white, because they would have given a strange expression to the head of the lion, or, like the present ones, would have made him appear blind. The choroid of the feline, like the chrysolite in an Italian poem of the thirteenth century, "casts rays of the colour of fire." If the eyes were not inlaid with such jewels, there could be set either carnelian or chrysoprases, or any other quartz *gatteggiante*. The eyes could also be even more fiery, without detracting from the effect of the bronze, if composed of one or more red gems.

The tufts of the mane begin at the neck and ears, where they are short and hooked, then developing into long, symmetrical locks, a lower one between two upper, run down the breast and lose themselves at the middle of the back. Every lock is formed of five or six cords, half a centimètre thick, flowing in serpentine form to a point, leaving the last undulation detached and raised, so that the mane is all bristling. Where the mane goes down along the shoulders, it covers the feathers of the base of the ancient wings; feathers may also be seen along the right side. These feathers are crudely cut for the insertion of the new wings. The difference between the original wings and the restored ones is plain; while the feathers of the first are concaved and uncut, those of the restored wings are convex and cut, making them more realistic. The ancient wings were nearer to each other and closer to the neck, as the original feathers are found where the mane reaches them, while the restored wings commence further down. As to the form, the ancient wings must have participated in that solemnity which, inspiring itself from sublimity, does not descend to despicable details; the severe line which the head forms with the mane and the body, may give an idea of their grand simplicity. Mr. Ruskin, with the intuition which is natural to him, arrived at the supposition that the ancient wings were far wider in their sweep than these, and "shred into plumage." ("St. Mark's Rest," i. 22.) The custom of cutting the wings, so that light might be seen between the feathers, was introduced by the Byzantines in their mosaics, and Giotto adopted it for the wings of angels. He was imitated by the artists of the fifteenth century, who painted lions of St. Mark, like Jacobello del Fiore and the *Donatus Venetus*, who kept themselves to the symbolic form of the wings. The lion of bronze must have had, for a stronger reason, the wing cut into plumes, in order to be perceived against the sky. There remains to us a meagre record of them in the wood engraving of Breydenbach (1486). In a picture of Bassano, in the great Council Hall, where is painted upon a grand scale the column of the Piazzetta, we perceive the lion with the wings cut in strips, and although, being only an accessory, the painter cared not to give it special expression, the material fact has not escaped him that the plumes were detached one from the other.

The lion was once gilded. I have found the traces of gold in the protected portions of the upper jaw. Under the stomach there is a little door, restored, through which one could pass into his head; but it is now locked; I do not know why. I was unable to find any inscription on the ancient cast, or anything referring to the restorations. There are some initials, but they are recent and of no importance. I left the two fragments of bronze as I found them, lying upon the top capital. This Lion of St. Mark, the symbol of the Venetian Republic, is admirable in so far as it expresses fierceness and magnanimous power. It looks far away, and, pressing its paws firmly against the book, seems to send to the Orient a roaring of defiance. Mr. Ruskin could not fail to perceive the beauty of "one of the grandest things produced by Mediæval art," and judged it a work of the thirteenth century. ("Stones of Venice," iii. 233.) The name of an *Aurifex Venetus*, of the year 1300, is found upon the bronze railings of the church of St. Mark, and Vasari tells that the doors of the Florentine Baptistery, modelled by Andrea Pisano, were cast in bronze by Venetian masters "very skilful in casting metals." But I believe that our bronze lion is anterior to these works, and therefore anterior also to the *St. Theodore*, of stone, which, according to Sansovino, was erected upon the other column of the Piazzetta in the beginning of the fourteenth century. Without pretending that the lion was placed upon the column soon after it was erected by the Doge Ziani, we may grant that in the thirteenth century there were *magistri Veneti* capable of undertaking such a work, if, shortly after, a good reputation followed them into Tuscany.

Mr. A. Cappello has carried out the enamel mosaic decorations in the new town hall of Leamington. In the tympanum is a figure of Hygeia, with figures of winged boys at the sides pouring water from vases, and thus symbolising the mineral waters of the town. There is also a circular panel representing Justice.

### "The State and Art."

SIR,—I am very much obliged to you for the two articles (September 20 and October 4) in which you have treated of the brochure I have published on the relation of Architecture and Public Buildings to School, Academy, and State in Paris and London; and I shall be still further obliged if you will grant me space to comment upon one or two statements made in your thoughtful review, and to add a few remarks which seem to grow out of it.

In England the terms "academy" and "school" are synonymous. To speak of an academy for young gentlemen is, as everybody knows, only an aristocratic way of describing a preparatory school for boys. Indeed, the very courteous acknowledgment I received from the South Kensington Museum of the offering I made to its library of my little book, contained the full title, with the exception of the word "academy," which was scrupulously omitted. But the distinction between an academy and a school is clearly defined by our neighbours, and although the former term has been often misapplied in France, it has never suffered such vicissitudes in that country as it has endured in this. According to Littré, "Académie" is a "compagnie de gens de lettres, de savants, ou d'artistes." Further on he explains, "L'Académie, dépositaire des bienséances et de la pureté du goût." His principal definition of a school is equally clear. "Ecole est un établissement où l'on enseigne les éléments des lettres, des sciences, des arts." Now when any one conversant with French institutions speaks of "the Academy," he means the Académie Française, which is a body of forty distinguished men famous chiefly in literature. It includes the Duc de Broglie and Victor Hugo; Emile Ollivier, of the light heart, and John Lemoine, the press-writer; the Duc d'Aumale and Sardou, the playwright. The other four academies are always necessarily distinguished by their names, such as that of Science, of Inscriptions, of Fine Arts, and of Moral and Political Science. The members of the five academies are known as "membres de l'Institut de France," and the title of "académicien" is rarely used. Now pardon me if I state that your reviewer is not so clear on this subject as his evident familiarity with French history might lead one to expect. "At the Revolution," he maintains, "when inquisition was made into abuses, the Academy was spared." But which academy? All the academies and kindred societies were spared in 1789 when the Revolution broke out; they were all suppressed in 1793, and the grants hitherto made to them discontinued. Nothing more was heard of the term "academy" until the reign of Louis XVIII., when the "Classe des Beaux-arts" became the "Académie royale des Beaux-arts," and the three other "classes" composing the Institut de France became respectively the "Académie Française" (the old title), the "Académie royale des Sciences," and the "Académie royale des Inscriptions et Belles-lettres." Except that the word "royale" has been omitted in every instance and that another academy has been added, the organisation of 1816 has continued to the present time, and the five academies meet in turn and together under the dome of the Palais de l'Institut, originally the Collège Mazarin, or the Collège des quatre nations. It is noteworthy that an iconoclastic republic, a destroyer also of kings and nobles, founded this great community for the furtherance of literature, science, and art by a decree dated Oct. 25, 1795, and forbade any other French federation to take the name of "Institut," a rule which is still observed. Even more, a republic continues to support this great institution, and has done more to increase the value and usefulness of the School of Fine Arts, in the Rue Bonaparte, than any one of the sovereigns who preceded it.

The reforms of 1864-65 completed the separation of the School, from the Academy of Fine Arts, a separation which was begun in 1816, when Debret (whose daughter Duban married) was ordered to convert the old convent buildings—until then used as a museum—into a school for the instruction of painting, sculpture, and architecture. Until Viollet-le-Duc's attacks roused the ministers of Napoleon III. to action, the Academy of Fine Arts enjoyed as much immunity from State control or public inquiry as our own Royal Academy does at the present moment. It deliberated in "general assemblies" and in secret. It gave little account of its expenditure to the Minister of the Crown who was responsible for the grants made to it, and it answered him very much in the same fashion as our own Royal Academy appears to have recently answered Mr. Gladstone in the matter of the Chantrey Bequest. All this was wisely rectified in 1865, and the advantages of the School of Fine Arts, hitherto restricted to few, have been since enjoyed by many. At the same time the Academy of Fine Arts, recognised as a tribunal of experts, entered upon a new life; and it has since enjoyed greater prestige than before. Ten years afterwards it received Paul Abadie, who was what in England is called "a Gothic man," and who had never gained the honours which admit a student to the Academy of France at Rome.

Your reviewer infers that I ascribe the foundation of the French school to Colbert. He also half likens the Communauté de St.-Luc to the Incorporated Society of Artists, which met in St. Martin's Lane. *Grands dieux!* as Thackeray would have exclaimed. The Académie de St.-Luc, as it was ultimately called, had existed for nearly four hundred years when the famous medal which recorded its decease was struck, having been founded at the close of the fourteenth century. The Incorporated Society only came into any sort of existence about the time when the Académie de St.-Luc was preparing for its last agonies, and the two expired together. Again, it would be impossible for anyone with an historical knowledge of the Abbey of Cluny to ascribe the foundation of "the French school" to Colbert. The early dissemination of art by men trained in that cosmopolitan centre, and its radiation thence into Germany, England, Spain, and even Italy, are known to all who have studied the history of Mediæval architecture and the subsidiary arts. The Communauté de St.-Luc was one of the Mediæval guilds; that it was able to weather the storms of the Renaissance is evidence of its original worth and power. Academies came in with all the notes and sketches and casts which Philibert Delorme, who measured the principal buildings in Rome before 1536, and Poussin and Lebrun, master and pupil, who lived under the same roof in Rome before 1640, brought or sent to France. Was not Mazarin an Italian? and were not the great cities of Italy to the French and English travellers of that day very much what Paris and Vienna now are to the student from Stockholm or Copenhagen, or even Canada and the United States? The foundation of the "academic system" in France is undoubtedly due to Colbert, who would not accept the "laissez-faire" principle even in commerce. He did not certainly found the Academy of Painting and Sculpture (Lebrun's Academy), which was recognised in 1648. At that time Colbert was barely thirty. If he had already been introduced to Mazarin, which is doubtful, he was merely the cardinal's amanuensis or private secretary. It is well to be particular on this point, because Victor Baltard, in his "Villa Médicis," twice makes the slip of attributing the foundation of that Academy to Colbert, and confirms his error by adding the date, namely, "en 1648." The fact is, the intention to found an Academy of Painting and Sculpture had been long uppermost in many men's minds, for Blondel states that that Academy owed its first institution to the care and protection of Monseigneur des Noyers, a Secretary of State who retired in 1463 and died in 1645.

Your reviewer also infers that architects were not associated until 1720 with the Academy, meaning, I presume, the Academy of Painting and Sculpture. True, the first architect-student who was sent to Rome by that Academy was Dorisot, in 1720; but many had been sent there previously; and Wren, in the "Parentalia," distinctly states that "an academy of painters, sculptors, architects, and the chief artificers of the Louvre, meet every first and last Saturday of the month." He wrote that in 1665. The Academy of Architecture, founded by Colbert in 1671, met twice a week by the king's orders, and Blondel's first presidential address, delivered in 1675, is a noble piece of exhortation. Though that Academy received no charter until 1717, it educated the French architects of the last quarter of the seventeenth and the whole of the eighteenth century—men who carried the fame of their country into all parts of Europe, and even into Asia. That from the time of "Du Bos in 1719 to Viollet-le-Duc in 1864 there has been unceasing grumbling at the defects of the academic system" is indisputable. Nay, more, it is going on still. M. Ruprich-Robert has recently attacked in an able manner the French system of architectural education, M. Hénard has with equal ability defended it; and only last week I was enabled to hand the two pamphlets to the librarian of the Institute of Architects.

A clause in the second charter granted to the Academy of Painting and Sculpture contains words of a most suggestive character. This deed was executed in 1777 under Louis XVI., and by it the two arts of painting and sculpture were "assimilated with letters, science, and the other liberal arts, *especially architecture.*" Pray mark the distinction well, for it shows that hitherto the supremacy of architecture had been generally acknowledged. In the course of the hundred years which have followed, the painters have not only maintained the position then accorded to them, but they have gradually risen to a higher one. From the beginning of this century the order of precedence has been (1) painting, (2) sculpture, and (3) architecture. Nevertheless, the whirligig of Time may yet give the last-named its revenge, and the coming race may yet prove that the late Lord Lytton was, if a satirist, a prophet besides. In this country a social revolution is taking place quietly, the consequences of which neither men nor women care to discuss, even though it be felt that the next century may see them struggling, not in the character of mates and helpmates, but as foes in fierce competition with each other. Nowhere will this be felt more acutely than in those arts "that require rather the finger than the arm," in which, as Bacon says in his essay on "The True Greatness of Kingdoms and Estates," the ancient states of Sparta, Athens, Rome, and others, "had the use of slaves, which commonly did rid those manufactures." Indeed, if Pliny may be credited, some of the Roman painters were women, and surely painting and modelling rank in Bacon's

category. Facts have shown also that a great painter need not necessarily be a man of mental power. At the end of last year half, or nearly half, of the students who attended the schools of the Royal Academy in London were ladies. The number of students entered on the books amounted to four hundred, of whom about two hundred and fifty usually attended. Of these nearly half—about one hundred and twenty—were females, and it goes without saying that their ambition reaches no further than to wield the brush and palette, or to manipulate moist clay. I have a theory on this point, and am rash enough to risk ridicule about it. The Royal Academy, ere long, will be forced to open its portals to strong, refined, and cultured women who have learned to paint or model. Then, as time jogs on, the sculptors and architects, if not previously driven out, will leave the Royal Academy of their own accord. The more effeminate, bodily and mentally regarded, of the males may remain, say a few draughtsmen to represent architecture, and a few modellers sculpture, but in the end the majority of the painters will be women. Sculptors, in the true sense of the term, and architects who are properly trained, and who have acquired experience, need nurse no similar suspicion. The muscular character of the work demanded of the former, and the mental power necessary for the due performance of the other's duties, are proof against the encroachments of the "softer man." As far as this country is concerned, I give painting another twenty years of supremacy—no more. The sentiment which thirty years ago the sorrows of "Clive Newcome Esq." inspired in the swollen breast of Bull will have evaporated by that time.

Your reviewer believes that the day has gone by when a repetition of the honours paid to a Bernini is possible or probable. I do not think so. At the worst, the English of the present day have shown an alacrity in burying architects which might have astonished the Grand Monarch. In twenty-five years four have received funeral honours almost national in character. Cockerell in St. Paul's Cathedral, Barry, Scott, and Street (the last not without a protest) in Westminster Abbey, were lowered to their graves with a pomp and solemnity far above the magnificent affectation of Louis XIV. Indeed, the respect ostentatiously entertained in France for the eight architect-academicians is genuine, as such things go, for it is largely inspired by patriotism and self-love. The Paris "rough," who would hoot a prince, doffs his cap naturally in the presence of M. Questel or M. Ballu.

I shall always esteem it good fortune to have been enabled to converse freely with many distinguished architects, both of France and England. The first time I went over the works of the new Cour de Cassation, in Paris, in company with its architect, I ventured to say to him that we in England knew more of his half namesake, Viollet-le-Duc, than of himself. This was soon after the reforms of 1865. Louis Duc looked hard at me, then cautiously around, and whispered "un habile dessinateur," his tone and manner showing that he did not intend a compliment. Burges astonished me in the same fashion about ten years ago. Holding strong views on mental and manual experience in matters of architecture, his advice to the student-traveller was—"Make copious notes of any building you visit, look at it well, measure parts of it, compare them with other parts of contemporaneous works, put your thoughts thereon upon paper, but don't make pretty sketches." Eugène Millet was of the same opinion, and proved it by his practice. The slightest inquiry into the recorded views of the great thinkers on architecture suffices to show that their ideal of an ordinary architect was far removed from that which obtains at the present day in England, and is blindly accepted by the profession as well as the public. Semper thought that an architect should, when a student, be trained in literature and the sciences, especially in mathematics. Quatremère de Quincy begins his life of Blondel with the words—"Une sorte de singularité a voulu que les auteurs des trois monuments que la France place en tête de ses plus célèbres ouvrages d'architecture, n'aient point fait de cet art leur profession spéciale." The first architect of the Louvre, Pierre Lescot, was an ecclesiastic; Claude Perrault, who designed the famous portico, was a doctor of medicine; François Blondel, the architect of the beautiful arch at the Porte St.-Denis, had been employed on diplomatic missions, had travelled for years, had taught mathematics, and was the dauphin's tutor before he commenced the practice of architecture in 1665, at the age of forty-seven, and sought a livelihood by it. Inigo Jones, Sir Christopher Wren, Sir William Chambers, were men of vast experience, acquired under similarly extended conditions, who served an apprenticeship to the world, and who, if anything, were scientific before they took to architecture as an art and a profession. I often wonder whether the young gentlemen who in this country have set up as "architects," after having served three years in a practitioner's office, have ever read the lives of those without whom the profession of architecture would not have existed. Finally, let me go back to the thirteenth century. I cannot think that the men who devised the cathedrals, castles, and town halls of that period were simply the artificers who built them, and who drew full-size the various portions of the work on the ground or on a wall, just as French carpenters and stonemasons do now. I think they were men who spent the early years of life in the Abbey or University of Cluny, or in one

of its many branches, men who travelled to distant lands, taking necessarily a long time to do so, and staying for long periods in the chief ecclesiastical centres. No doubt in the fourteenth and fifteenth centuries, when traditions had accumulated, and could be preserved or handed down, the workman was employed to design as well as build. The words of Philibert Delorme seem to confirm this, for in the middle of the sixteenth century he wrote—"Aujourd'hui, en plusieurs pays, la charette conduit les bœufs : c'est à dire les maçons, en plusieurs lieux, gouvernent et enseignent les maîtres."

These are points, Sir, which I venture to think are worthy of more than a superficial consideration, especially at the present time, when the youth of the profession constitute an array of artistic talent and manipulative excellence never before witnessed in this country. I am convinced that if architecture is to hold the place it ought to hold in the next century, when undoubtedly Great Britain will assume an ascendancy in the minor arts, architects must aspire to be something better and more intellectual than mere artists or handicraftsmen, and the press can do untold service by continuing to treat of the vast and complicated question of how they should be taught and formed. The sooner students of any worth find out the truth in this respect—and existing facts speak volumes—the better it will be for themselves, for the future of the profession, and for that backward British public who, I readily admit, are not yet prepared to shoot architecture into the region of practical politics-à-la-mode.

I am, Sir, your obedient servant,  
WILLIAM H. WHITE.

### ART SCHOOLS.

**Canterbury.**—The School of Art, founded by Mr. T. Sidney Cooper, R.A., and presented by him to his native city, was reopened on Monday. Mr. Cooper, in declaring the school open, said he purchased the site on which the gallery was erected for the purpose of instructing a few poor boys in the art of drawing and painting. His infant gallery soon began to grow, and after extending the premises he found it impossible for him to devote sufficient time and attention to the increasing number of pupils. He, therefore, determined to give expression to an intention he had long formed, and present the gallery to the city. He mentioned that three of the boys whom he taught at the gallery were now in permanent and remunerative employment in the exercise of art in London, and added that he should continue to give gratuitous instruction at the evening lessons for the artisan classes, his main purpose being to enable poor boys having talent in them to rise to fame and honour in the art world.

### CHURCH BUILDING AND RESTORATION.

**Brighton.**—The foundation and memorial-stones of a Wesleyan church at the bottom of Dorset Gardens have been laid. The building is being erected from the designs of Mr. C. O. Ellison, of Liverpool, under the direction of Mr. Arthur Loader, architect, Brighton. Mr. W. Taylor, of Brighton, is the builder. Messrs. Monk, Newall & Bryan, of Ruabon, supply the terra-cotta used in the construction.

**Exeter.**—Holy Trinity church has been reopened after improvements carried out under the direction of Mr. Ashworth, architect, Exeter. The works have been carried out by Mr. Stile; the painting and colouring by Messrs. Kingwell, and also the ornamental glazing; the gas lighting has been improved by Messrs. Toby & Bowden—all of Exeter.

**Northleach.**—The church of Northleach on the Cotswolds has been reopened after restoration under the direction of Mr. Brooks, architect, London. The works have been carried out by Mr. Groves, contractor.

**Stock Gaylard.**—The foundation-stone of a new church, to be erected on the site of the old structure which has just been taken down, has been laid. The building is designed in the style of the Decorated period. The architect is Mr. W. J. Fletcher, of Wimborne, and the builder Mr. E. W. Kingman, of Lydlinch.

**Whitwell Church.**—The following statement on the proposed restoration of the parish church, Whitwell, Derbyshire, has been issued:—Whitwell parish church (dedicated to St. Lawrence) is an unusually fine Norman building, and dates from the twelfth century. There is an interesting Norman doorway on the west, and a grotesque corbel table at the north and south. The interior contains massive Norman pillars and a grand chancel arch. It was altered and enlarged in the fourteenth century, and in the sixteenth the old high-pitched roofs were lowered to the present elevation. The church is connected with the families of Frecheville, Meynell, Pipe, Wentworth, Manners, and others, whose armorial bearings still decorate the interior. In the year 1592, the property passed into the hands of Sir John Manners, ancestor of the Dukes of Rutland. In the north transept there is a rich

alabaster monument (much decayed) to "the noble, learned, and religious knight," Sir Roger Manners (1632). The property now belongs to the Duke of Portland, who is the present patron. This fine old church is gradually falling into a sad state of decay. The restoration is a work of pressing necessity. There are cracks in the tower and chancel arch. The keystone of the east window in the chancel is only kept from falling by a beam. The lead covering of the roofs is very defective. The wet penetrates both roofs and walls. The accumulation of earth outside and the imperfect drainage render the interior of the church so damp as to be injurious to health and to damage the organ and other furniture. The brick walling at back of tomb (Sir R. Manners') is unsound; the water goes through it. The stone dressings of the windows and other features outside are in very many places much decayed. The lead-work is rotten. The glass is almost falling to pieces, and cannot be kept in repair. The church has suffered much from the ill-judged alterations of successive generations. The whole floor is much above the original level, entirely concealing the base of the pillars and destroying their proportions. The seats are raised still higher on platforms. The pews conceal the worshippers and render kneeling very difficult. The roofs of the chancel and transepts quite destroy the effect of these features, which in this church would otherwise be remarkably fine. The western arch between the nave and tower is blocked up, and a heavy gallery, which makes hearing very difficult for those seated beneath it, is erected in front. These and many other defects render an immediate restoration imperative. The estimated cost (including oak seats, organ-chamber, heating-vault, and heating apparatus) is 3,100*l*. On September 10, 1883, Mr. J. L. Pearson, R.A., was chosen as architect. His name affords a sufficient guarantee that the restoration will be undertaken in a carefully reverent and conservative spirit.

### GENERAL.

**Mr. Wm. Kenrick** has presented to the Birmingham Art Gallery the picture by William Geets, *A Martyr of the Sixteenth Century*. It was exhibited this year in the Royal Academy. Mr. Henry Moore's *Summer Time off Cornwall* has also been presented to the gallery.

**The Memorial of the Landing of St. Augustine** left the studio of Mr. Roddis, at Birmingham, last week, and is now in course of erection and completion on Lord Granville's estate near Pegwell Bay, in the Isle of Thanet.

**A Part of the Old City Moat at Hereford** has been discovered during the progress of the excavations for the foundations of some new offices now being erected under the superintendence of Messrs. Willett & Wakeling, architects. It ran parallel to the old city walls, and was V-shaped on the inner side, and is at this point some 15 feet deep.

**The Pier** constructed by the Board of Works at Clarecastle, Port of Ennis, from which it is two miles distant, has within the last few days given signs of collapse, and is now in such an unsafe condition that no vessels can pass under it. The pier cost over 5,000*l*.

**Her Majesty the Queen** has presented, without any solicitation, a copy of her last book to Messrs. Chubb & Son's Workmen's Library, with an autograph affixed on the title-page.

**The Great Eastern Railway Company** have just opened the new Brimsdown Station on the Cambridge line, midway between Ponder's End and Ordnance Factory. The district, though comparatively unknown, is attractive, and there are some good residential properties in the immediate vicinity.

**Messrs. J. L. Bacon & Co.** have obtained the contracts for heating St. Michael's Mission Room, Camberwell, and the Congregational Church, Upton.

**The Edinburgh Town Council** intend to apply to Parliament during the ensuing session for powers authorising the construction of a sewer for the conveyance of the sewage of the southern part of Edinburgh into the sea at Portobello, and so doing away with the pollution of the Pow Burn. The scheme, which was some time since sanctioned by the Town Council, is expected to cost about 25,000*l*.

**A "Blackman Air Propeller,"** 48 inches diameter, is used for exhausting the vitiated air from the new Council Chamber at the Guildhall.

**Messrs. Robert Boyle & Son**, Ventilating, Sanitary, and Consulting Engineers, 64 Holborn Viaduct, and Glasgow, have been awarded at the Art and Sanitary Exhibition, Eastbourne, the first prize medal (silver) for their systems of ventilation, sanitation, and heating, and their patent self-acting air-pump ventilators, being the only award given for ventilating or sanitary appliances.

**Messrs. Archibald Smith & Stevens**, of Queen's Road, Battersea, have in course of construction for the Mont Doré Sanatorium, Bournemouth, two hydraulic passenger lifts, upon Stevens & Major's patent suspended principle. They are also erecting in connection with these lifts a complete set of high-pressure pumping machinery.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, OCTOBER 11, 1884.

### TENDERS, ETC.

**\*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.**

**\*\* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—“Contract Supplement to THE ARCHITECT.”**

### EDITORIAL NOTICES.

**The authors of signed articles and papers read in public must necessarily be held responsible for their contents.**

**No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.**

**Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.**

### ADVERTISEMENT SCALE.

For Two Lines and under	£0 2 6
For every Additional Line	0 0 6
For Quarter Page	2 10 0
For Half Page	4 10 0
For a Page	8 8 0

**On pages preceding and following matter, special rates.**

**Public Companies' Advertisements, 12l. 12s. per page; 1s. per line.**

### COMPETITIONS OPEN.

**BOMBAY.**—Nov. 6.—The Municipal Commissioner of Bombay invites Designs and Estimates for a New Municipal Hall and Offices, which must be sent to his Office by Twelve noon, on Nov. 6. A Premium of 5,000 rs. will be given for the Design most approved of by the Commissioner, with the assistance of a Committee of the Corporation; 3,000 rs. for the second, and 2,000 rs. for the third. The total cost of the buildings is not to exceed 5 lacs (5,00,000 rs.). Mr. E. C. K. Ollivant, Municipal Commissioner's Office, Bombay, or at Messrs. E. W. & R. Oliver, 1 Corbet Court, Gracechurch Street, London.

**EGHAM.**—Oct. 11.—Designs are invited for the Erection of a School to accommodate 320 Children. Mr. Benjamin Tice, Clerk to the School Board, Irene Villa, Egham.

**SOOTHILL.**—Nov. 6.—Plans are Required for a Board School proposed to be Erected in Gregory Street. Mr. J. D. Good, Market Place, Dewsbury.

### CONTRACTS OPEN.

**ABERDUR.**—Oct. 11.—For Building Dwelling-house on Farm of Sauchentree. Mr. J. D. Sharp, Bank Agent, Rosehearty.

**ACCRINGTON.**—For Boundary Walls, Seating, and Heating Apparatus of Church of St. John. Mr. Henry Ross, Architect, Birch Street, Accrington.

**ASHBURTON.**—Oct. 11.—For Building Coach-house, Stables, and other Buildings. Mr. G. E. Allen, Southern House, North Haish, Ivybridge.

**BARRY ISLAND.**—Oct. 14.—For Construction of Dock and Railway (seven miles). Messrs. J. W. Barry & H. M. Brunel, 23 Delahay Street, Westminster.

**BASINGSTOKE.**—Oct. 14.—For Alterations to Lesser Market. Mr. H. Budden, Borough Surveyor, Town Hall, Basingstoke.

**BATLEY.**—Oct. 11.—For Building House, Talbot Street. Mr. G. Hey, 10 Albert Terrace, Albert Street, Batley.

**BELFAST.**—Oct. 11.—For Work in Wards at Royal Hospital. Mr. Watt, Architect, 77A Victoria Street, Belfast.

**BELFAST.**—Oct. 14.—For Building Two Dwelling-houses. Messrs. Young & Mackenzie, Architects, 7 Donegal Square East, Belfast.

**BINGLEY.**—Oct. 11.—For Building Ten Houses and Two Shops, Church Street. Messrs. J. & J. Clark, Stone Merchants, Bingley.

**BIRMINGHAM.**—Oct. 14.—For Cooking Apparatus for New Kitchen at the Workhouse. Mr. W. H. Ward, Architect, Paradise Street, Birmingham.

**BOLTON.**—For Laying Pipe Sewers (75) yards, &c. Mr. T. E. Smith, Wood Street, Bolton.

**BOMBAY.**—Nov. 14.—For Masonry and Excavation of Wet Dock (25 acres area), to include Wharf Walls (7,750 feet), Sea Entrance, &c. Mr. J. A. McConnochie, C.E., Engineer's Office, Surrey Commercial Docks, Rotherhithe.

**BRADFORD.**—Oct. 13.—For Building Railway Goods Offices. The Engineer, Hunt's Bank, Manchester.

**BROUGHTON-IN-FURNESS.**—Oct. 14.—For Additions to Dwelling-house for a Police Station. Mr. J. W. Grundy, Architect, Brogden Street, Ulverston.

**BURNLEY.**—Oct. 21.—For Building Mortuary, Town's Yard, and Boundary Walls, East Side of Parish Churchyard. Mr. J. Cartwright, Borough Surveyor, Burnley.

**BURNLEY.**—For Building Workshops, Burton Street. Mr. T. Bell, Architect, 14 Grimsshaw Street, Burnley.

**CARDIFF.**—Oct. 15.—For Repairing, Painting, and Renovating Portions of Town Hall. The Borough Engineer, Town Hall, Cardiff.

**CARDIFF.**—Oct. 24.—For Construction of Filters and Service Reservoirs, Boundary Wall, &c., Heath. Mr. J. A. B. Williams, C.E., Queen's Chambers, Cardiff.

**CROYDON.**—Oct. 16.—For Construction of Surface Water Drains (1,400 yards), South End District. The Borough Engineer, 8 Katherine Street, Croydon.

**CULLINGWORTH.**—Oct. 18.—For Building Shed at Eller Carr. Mr. J. B. Bailey, Architect, North Street, Keighley.

**DERBY.**—For Execution of Street Works, Mr. Thomas Coulthurst, Borough Engineer, Full Street, Derby.

**DUBLIN.**—Oct. 15.—For Main Sewer, Cabra Road. Mr. P. F. Lennard, C.E., 35 Lower Ormond Quay, Dublin.

**DUNDALK.**—Oct. 25.—For Construction of Works of Water Supply. Messrs. Hassard & Tyrrell, C.E., Westminster Chambers, Westminster.

**EASTCHAP.**—Oct. 21.—For Construction of Sewers, Gullies, &c. Colonel Haywood, Engineer to the Commissioners of Sewers, Guildhall, E.C.

**GARFORTH.**—For Alterations and Additions to Shop. Mr. C. D. Swale, Architect, 28 Albion Street, Leeds.

AWARDED SEVEN PRIZES FOR SUPERIORITY, INCLUDING PARIS GRAND MEDAL, 1878, THE CERTIFICATE OF MERIT OF THE SANITARY INSTITUTION OF GREAT BRITAIN, AND THE AWARD OF MERIT AT THE INTERNATIONAL EXHIBITION, 1881.

**TO ARCHITECTS.—THE BRICK of the FUTURE, that shall not get dingy or sooty like other Bricks, but, being of a Semi-Vitreous nature, will maintain a clean and washable surface.**

## FACING BRICKS AND BRICK ORNAMENT OF TRUE TERRA-COTTA, AS ALSO ARCHITECTURAL WORK, IN WHITE AND WARM-TINTED BUFF.

Made from the Finest Terra-cotta and Stoneware Clays, of a warm and pleasing appearance, of beautiful and superior quality and finish, non-absorbent, acid, fire, and alkali proof, will resist the most severe frosts, and when tested were found to withstand a pressure of 445 tons to the square foot. They have been used in the most exposed parts on the North and South Coasts, and being true Terra-cotta, are warranted imperishable.

Pattern Sheets and Price Lists of superior Glazed Stoneware Sanitary Pipes, and Fire Clay Goods, Chimney Tops, &c., on application.

Sole Manufacturers:—CANDY & CO., Limited, GREAT WESTERN POTTERIES, NEWTON ABBOT, AND 11 QUEEN VICTORIA STREET, LONDON, E.C.

Who are also Sole Makers of the celebrated "Granite Vitrified" Paving Bricks for Yards, Stables, and Footpaths, and "Granite Vitrified" Damp-proof Building Bricks, as used by H.M. Government for dock construction, &c. Samples free to Architects and Engineers.

GLASGOW.—Oct. 11.—For Carpenter's Shop and Smithy, at Belvidere, London Road. Mr. John Carrick, Master of Works, 74 Hutcheson Street, Glasgow.

GLASGOW.—For Construction of Iron Shed. Messrs. John Milligan & Co., 17 Oswald Street, Glasgow.

GRANGEMOUTH.—For Constructing Coffin Dam at Dry Dock. Mr. A. Brown, Kerse Estate Office, Falkirk.

GREAT HARWOOD.—Oct. 16.—For Building Sunday and Day-schools. Messrs. Maxwell, Tuke & Hurst, Architects, 175 Lord Street, Southport.

GREENOCK.—Oct. 15.—For Mason, Wright, and Iron-work, of Longwell Close Buildings (Section No. 1). Mr. C. McCulloch, Town Clerk.

HASTINGS.—Oct. 16.—For Construction of Brick Sewer and Pipe Drain, Primrose Vale. Messrs. Jeffery & Skiller, Surveyors, 5 Havelock Road, Hastings.

IRVINE.—Oct. 15.—For Laying Cast-Iron Pipes, &c., from Dykehead Reservoir to Muirside. Messrs. Leslie & Reid, C.E., 72A George Street, Edinburgh.

ISLE OF WIGHT.—Oct. 15.—For Construction of Sea Wall, &c., near Sandown Fort. Mr. Edwin Humphreys, General Surveyor of Highways, Newchurch.

LEEDS.—Oct. 11.—For Building Five Houses and Shop, Rosebank Road. Mr. J. Charles, Architect, 14 Butts Court, Leeds.

LEICESTER.—Oct. 23.—For Construction of Main and Storm Overflow Sewers, Dame Hill District, and Brick Sewers (1,319 yards and 269 yards) with Manholes, Ventilating Shafts, Bellmouth Junctions, Flushing Chambers, &c. Mr. J. Gordon, C.E., Borough Surveyor, Leicester.

LINCOLN.—Oct. 25.—For Sluice at Wainfleet Haven, with Outfall Cut, Enlargement of Bridges, &c., and Forming New Cut, Skegness. Mr. S. E. Williams, C.E., Bridge Street, Boston.

LONG LAWFORD.—Oct. 15.—For Building Branch Co-operative Store and Storekeeper's House. The Manager, Co-operative Society, Rugby.

LYME REGIS.—Oct. 25.—For Reseating Parish Church, Building Vestry, &c. Mr. R. W. Hillman, Solicitor, Lyme Regis.

MANNINGHAM.—Oct. 14.—For Building Riding School. Messrs. Fairbank & Wall, Architects, 155 Swan Arcade, Bradford.

MIDLETON.—For Repairing Roof of Church, &c. Messrs. H. & A. Hill, Architects, 2 George's Street, Cork.

MORPETH.—For Building Block of Three Dwelling Houses. Messrs. T. & R. Nicholson, Bridge Street, Morpeth.

NEATH.—Oct. 29.—For Construction of Reservoir, Laying Water Mains, &c. Mr. W. E. Thomas, Surveyor, 58 Water Street, Neath.

NEWPORT, MON.—Oct. 16.—For Reconstruction of Drainage at Barracks. The Royal Engineer Office, 108 Cowbridge Road, Canton, Cardiff.

NEWTON-LE-WILLOWS.—Oct. 20.—For Laying Pipe Sewers (1,400 yards). Mr. Richard Brierley, Surveyor, Newton-le-Willows.

NEW ROSS.—Oct. 29.—For Construction of Iron Viaduct with Swing Bridge over the River Barrow. Drawings, &c., at the Engineer's Office, Bray, co. Wicklow.

NOTTINGHAM.—Oct. 15.—For Building Dwarf Walls and Steps on the Forest, &c. Mr. Brown, Borough Engineer, Nottingham.

NOTTINGHAM.—Oct. 25.—For Building Five Shops, Gedling Street. Mr. Brown, Borough Engineer, Municipal Offices, Nottingham.

NOTTINGHAM.—For Pulling Down and Rebuilding Old, Royal Oak Inn and Building Stabling. Mr. Arthur W. Brewill, Architect, Exchange Chambers, Greyhound Street, Nottingham.

NOTTINGHAM.—For Building Bank Premises. Messrs. Evans & Jolley, Architects, Eldon Chambers, Nottingham.

OLD DOLPHIN.—Oct. 14.—For Building Two Houses. Mr. Herbert Hodgson, Architect, 68 High Street, Queensbury.

OLA, Co. LIMERICK.—Oct. 22.—For Building Constabulary Barrack. Mr. W. B. Soady, Offices of Public Works, Dublin.

OPORTO.—Dec. 15.—For Construction of Covered Market. Senor J. A. Correa de Barros, President of the Municipal Board of Oporto, Portugal.

PADDINGTON.—Oct. 15.—For Alterations and Additions, to Mortuary Buildings. Messrs. Higgs & Rudkin, Architects, 44 Bedford Row, W.C.

PADDOCK.—Oct. 13.—For Building Nine Houses and Outbuildings. Mr. William Ellis, Architect, Market Chambers, Market Place, Heckmondwike.

PORTUMNA.—Oct. 18.—For Proposed Changes at Workhouse Buildings. Mr. Kempster, County Surveyor, Balinasloe.

ROWDITCH.—Oct. 20.—For Construction of Roads. Mr. Thomas Coulthurst, Borough Engineer, Full Street, Derby.

SHARNFORD.—Oct. 16.—For Removal of Footbridge and Erection of New Bridge. Mr. Johnson, District Surveyor, Bitteswell, Lutterworth.

SOUTHOWRAM.—Oct. 20.—For Erection of Barn and Mital at Town Gate. Mr. Edwin Taylor, Architect, Hipperholme.

STRATFORD-ON-AVON.—For Alterations to Dwelling-house and Premises. Mr. T. T. Allen, Architect, Broad Street, Stratford-on-Avon.

SWANSEA.—Oct. 18.—For Building Public Library, Art Gallery, Science and Art Schools. Mr. Henry Holtom, Architect, Bond Street, Dewsbury.

TOWNSTAL.—Oct. 16.—For Heating Apparatus and Sundry Works at Church. Mr. Ashford, Churchwarden, Coombe, Dartmouth.

TREDEGAR.—Oct. 11.—For Building Villa Residence. Mr. C. Taylor, Architect, 22 Duke Street, Cardiff.

TRURO.—Oct. 18.—For Building Post Office. Mr. Silvanus Treval, Architect, Truro.

VICTORIA DOCKS, E.—Oct. 18.—For Building Sub-District Post Office. Mr. A. B. Mitford, Secretary, H.M. Office of Works, 12 Whitehall Place, S.W.

WAKEFIELD.—Oct. 20.—For Laying Stoneware Tubes (two miles), &c., to Farm Conduit. Mr. E. Filliter, C.E., 16 East Parade, Leeds.

WATFORD.—Oct. 14.—For Building Post Office. H.M. Office of Works, 12 Whitehall Place, S.W.

WEST HAM.—Oct. 14.—For Construction of Timber Piled Wall, Channelsea River, Abbey Mills. Mr. Lewis Angell, C.E., Engineer's Department, Town Hall, Stratford, E.

WOODLAND.—Oct. 11.—For Erection of Coachhouse, Stables, and other Buildings, &c. Mr. G. E. Allen, South-east House, North Huise, Ivybridge.

YORK.—For Building Six Dwelling-houses, Brunswick Place. Messrs. Fisher & Hepper, Architects, 16 Castle-gate, York.

## TENDERS.

### ALVESTON.

For Erection of New Church, including Tower, Alveston, near Bristol. Mr. HENRY LLOYD, Architect, Bristol. Quantities supplied.

STEPHENS & BASTOW, Bristol and London (accepted) . . . . . £3,176 0 0

### ASTON.

For Steam and Hot-water Pipes for Infirmary Wards, Aston.

E. & N. Mitton, Birmingham . . . . . £149 10 0  
Crichley, Weston & Co., Birmingham . . . . . 148 10 0  
Larmuth & Co., Salford . . . . . 142 5 0  
ROBINSON, Birmingham (accepted) . . . . . 100 18 6  
Parker, Birmingham . . . . . 98 16 0

### BRADFORD.

For Building Mill, Garnett Street, Bradford. Mr. G. C. GAMBLE, Architect.

*Accepted Tenders.*  
Bairstow, Shipley, mason . . . . . £300 0 0  
Hutchinson, Bradford, joiner . . . . . 90 0 0  
Hill & Nelson, Bradford, slater . . . . . 73 0 0  
Hodgson & Son, Bradford, plumber . . . . . 51 10 0  
Hargreaves, Bradford, plasterer . . . . . 13 10 0  
Arundel, Bradford, painter . . . . . 8 10 0

### CAMERON BRIDGE.

For Building Double Cottage at Cameron Bridge, Windygates, for Mr. H. V. Haig. Mr. JOHN HOUSTON, Architect, Dunfermline. Quantities by the Architect.

*Mason and Brickwork.*  
Wikie & Gibb, Leven . . . . . £289 0 0  
STREET & SONS, Dunfermline (accepted) . . . . . 269 14 0

Note Trade Mark.

## GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent  
consist in the heating surface being greater than any  
other Fire-grate introduced to the public. It is very  
simple in construction, and is made in the form of a Stove,  
the back of which is semicircular in shape, with gills  
behind and smoke-nozzle on top, all cast in one piece.  
The same can be attached to any design of a Register or  
Stovefront. It is very suitable for schools, class-rooms,  
waiting-rooms, hospitals, offices, dormitories, and dwelling-  
houses, from the cottage to the mansion. Design and  
specification post free on application.

## TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.  
"June 10, 1884.

"SIR,—I have much pleasure in testifying to the  
efficiency of your patent Warm-Air Fire Grate. It has  
been very successful, and given every satisfaction where I  
have used it. Yours, &c.  
"JAMES WEIR, F.R.I.B.A.

"To Mr. Grundy."

"Baptist Chapel, Clapham Common, London. Richard  
Webb, Pastor, 10 Grafton Square.  
"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the  
excellency and efficiency of your patent Fire-Grate. It is  
the most charming invention for heating a large room I  
have ever known. I shall have pleasure in showing it to  
anyone who wish to have their schools or rooms pleasantly  
and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,  
July 1884.

"DEAR SIR,—I have very great pleasure in stating that  
the first stove, or patent warm-air ventilating fire grate,  
adopted by me in school at Seaton, and a second in a  
Cocoa Palace, have given such satisfaction that I now  
order eleven to be inserted in New Upper Grade Schools in  
course of erection at West Hartlepool. They are the most  
economical, efficient, and easily managed stove at present  
before the public.  
"Mr. John Grundy."

Apply to JOHN GRUNDY, 30 Duncan Terrace, City  
Road, London.  
Works—TYLDESLEY, near MANCHESTER.

## SUNDERLAND.

DESIGN FOR ADMIRALTY & WAR OFFICES

[ WHITEHALL FRONT. ]

BY MESSRS SPALDING & AULD

# The Architect.

## A CHAPTER OF PRACTICAL CRITICISM CONTINUED: THE WAR OFFICE AND ADMIRALTY.

THE whole of the nine designs which engaged in the final competition for the new War Office and Admiralty having now been placed before our readers, we may appropriately offer a few further remarks of a critical character upon a comparison of their principles of artistic composition. On the former occasion\* we confined ourselves to the design of Messrs. LEEMING, using that of Messrs. STARK & LINDSAY for occasional purposes of contrast; we now take leave to introduce also those of Messrs. VERITY & HUNT, Messrs. WEBB & BELL, and Messrs. MAXWELL & TUKE; still dealing with the perspective views as to be seen from St. James's Park.†

It ought to be borne in mind, no doubt, if we take the highest ground in the criticism of any exterior design, that the basis of composition ought to be the plan. It is one of the boasted merits of the Gothic method that this rule need never be violated in any case, however complex, in which the designer rightly follows its principles; mere symmetry need not be made use of at all, and, when it is, it will be as the servant, not the master, of the architect's will. It is still more the opprobrium of the modern Classic method that the rule is almost universally disregarded, symmetry being the master and not the servant, and the style being in practice undeniably the slave of a certain arbitrary system of superficial uniformity at any price, which sets at defiance the relations of exterior and interior throughout the whole process of design. The exterior, in other words, ought to be the honest and natural skin or surface of the interior; in good Gothic it is so; and in Classic it is not.

Now it ought never to be overlooked that it is not the features of the Classic style in detail that necessarily offend in this way against the rule of fitness; it is mere academicalism in the treatment of masses—an element which may be dispensed with, and in some cases has been. Not, perhaps, in the case of a great municipal building, but often in such an example as a rural villa, it has been the pride of the Classic architect to reject such symmetry ostentatiously, and even to carry irregularity and picturesqueness to the full extent of the interior requirements, if not a little farther. Therefore in such a problem as the one before us, under different circumstances, it would be perfectly possible, and (so to speak) sufficiently easy, for any architect who is master of piquant design as well as of Classic detail to set out his plan strictly on the Gothic or irregular method, and to let the outside follow the inside as it best could, setting all symmetry at naught. The result, be it clearly understood, might still be of the Classic style, although entirely free from what we may call the Palladian spirit. It would be free Classic.

In the present case, no doubt, there is a special reason why this kind of freedom is not to be hoped for; indeed, we may say, looking at the necessary uniformity of character in the whole scheme of interior organisation, it is not asked for. But at any rate the critic is still entitled to inquire whether the general massing of the exterior does or does not correspond with the general massing of the plan. If it does not correspond, then the composition of the exterior is founded more or less upon falsification; for the outside is not true to the inside even in its broadest facts. Regarded in this way Messrs. LEEMING's design is not as it ought to be; for the observer of the Park front would certainly never suppose that the transverse range of building which forms the south flank towards the Horse Guards is repeated, not at the northern end, but in a position entirely at haphazard about two-thirds down the line. In the design of Messrs. WEBB & BELL the arrangement is in this respect both better and worse—and, by the way, extremely

cleverly manipulated; there is symmetry towards the Park, and symmetry towards the interior court at the back, but the two symmetries have different axial or centre-lines, disagreeing only by a few feet in a most unusual way. (The block plan of this design is as fine an academical study of the ambitious order as one could wish to see.) Then the correspondence without and within in Messrs. MAXWELL & TUKE's block plan seems to be absolutely perfect—a most admirable success in the utmost simplicity of motive. Messrs. VERITY & HUNT's symmetries are also highly successful so far, the exterior reading being true to the interior; and of Messrs. STARK & LINDSAY's design very much the same may be said. The proposition we submit, thus so amply illustrated, is no less than this—that the reading of the exterior composition, even by the comparatively inexperienced eye, ought to carry with it a correct idea of the block plan behind; and, indeed, that the disregard of this rule of correspondence is one of the essential points in which the Gothic method claims the pre-eminence of truth over the make-believe of Neo-Classic.

Following out the same principles of criticism, and applying it now to the leading features of the wall composition, we may observe in Messrs. MAXWELL & TUKE's design how well the noble corner pavilions stand on the plan. In Messrs. STARK & LINDSAY's the flanking towers, although not telling so plain a story, are scarcely to be objected to; but the increased height of the central mass of the principal façade, although highly effective, is not well accounted for on the plan, and the reflection of this on the flank wall is still less so. Then on Messrs. WEBB & BELL's composition, which aims at the picturesque more emphatically than any of the others, the great corner pavilions, taken each as a whole, are in reality in the shape of an L on plan, while the middle pavilion, in a way which is particularly characteristic of modern work both Classic and Gothic, has no back wall at all, and scarcely any side walls; indeed the same may be said of the corner pavilions. In Messrs. LEEMING's design the corner campanili are no doubt accounted for on the plan, albeit only as regards their construction; but the only evidence which is offered by the interior as regards the intermediate pavilion-like projections with their turrets and lofty roofs must be taken to be that the things are absolutely nothings, their value being of course just the same on the flank wall. Lastly, the design of Messrs. VERITY & HUNT is in this respect the most complete superficialisation from end to end; the elevation and the plan having no critical accordance whatsoever as regards motive, and the effect of the whole mass of building being in reality that of a solid block, with the outer walls "broken up" in the way they are, on the same principle as in the treatment of Newgate Prison and the Bank of England, for the sake of breaking them up, and nothing else. Here again we submit the rule without compromise that, in Classic composition of high class, every feature of the exterior ought to tell a tale of the disposition of the interior. It would be too much to say that, as in Gothic work of the perfectly unrestrained type, every nook and cranny and closet inside should thrust itself into view outside brusquely and often awkwardly, but the alternative in Classic treatment is simply to dispose along the stately façades the stately rooms only, in the utmost regularity possible, and to place all the irregularity and awkwardness out of sight, or on inner façades, where they can be grouped in a way of their own with their own effect. Roofs, also, pavilions, wings, towers, and so on, ought always to tell a tale of truth and not falsity; and symmetry without ought to accord with a symmetry within, which is the same symmetry and not another.

Many of our readers may think this sort of criticism, however dignified, is oppressive, a burden greater than mere humanity can bear; for, although Nature, it is true, asks for no consideration, the mortal architect must be allowed to err. To this we can only answer that even if the perfection of the ideal may be beyond attainment in fact, still it need not be surrendered in fancy; and indeed it is nothing else but the surrender of this perfection in the criticism of modern Classic architecture that has produced the universal sham which so inveterately characterises the method in practice, and which it may be the task of robust English intelligence in another generation to succeed, first in clearly discerning, and then in effectually sweeping away. It cannot be too often repeated that the great merit of the Gothic method is that there need be no sham at all, and that in its best work there is none.

The all-important question of the scale of an architectural

\* See p. 161, September 13.

† For these illustrations, see our issues for August 30 and September 6, 13, and 27.

composition—that is, the correspondence or uniformity of scale which ought to prevail throughout the details—is illustrated by the designs before us. The most common instance of a disregard of this principle is when in standard Cinquecento work there is a range of big columns along a façade supporting the main entablature, with a range of little columns in the inter-spaces supporting the arches of the windows; or, what is almost worse, with the same little columns supporting, over the windows, little pediments—probably angular and curved pediments alternately, as if to show how completely independent of minor considerations of severity the modern architect can be. But, if the rule of scale is to be put in force at all, it must go much farther than the avoidance of such a practice as this. It may be laid down to signify that all features whatever ought primarily to wear an appearance of equal weight in the composition, that is to say, equal heaviness or equal lightness. Emphasis may of course be given to one part or another notwithstanding this; and artistic grouping may produce any amount of incidental vigour, local force, or power. But when these effects are accomplished only by augmenting the heaviness or massiveness of the building—generally the actual size of the stones, or what that size ought to be—then there is a want of scale. In Messrs. STARK & LINDSAY'S work the rule of scale seems to be generally well observed; barring the tiny columns at the windows; but whether it is right to increase the scale at the summit of the towers is a fair question. In Messrs. MAXWELL & TUKE'S the two-storey order in the corner pavilions and the central block is a breach of the rule; and there seems to be a very small-scale order by the windows besides. In Messrs. WEBB & BELL'S the scale is perhaps perfect; the comparatively large arches which are so conspicuous, we may remark, being still small-stone work like the rest, and the supporting columns quite in scale. Messrs. VERITY & HUNT set all scale at defiance; and so do Messrs. LEEMING. In this last design the disparity between the heaviness of the main columns and their basement piers and the lightness of some of the window dressings is very remarkable.

On the whole we regard these designs—although seldom attaining the dignity of the higher Classic—as furnishing to the student, whether young or old, an opportunity that ought not to be undervalued for attempting experiments in artistic criticism which are much needed in the present state of architectural opinion and practice.

## ICELAND.

By J. STARKIE GARDNER, F.G.S.

THE utter disappearance, with the most trifling exceptions, of the dwellings and even public buildings of the Anglo-Saxon period, which must have been one of relatively high civilisation, has been a subject of wonder to moderately well-informed people like myself.

I had the opportunity a short time since of traversing Iceland in many directions. The country is civilised, and has a history in many respects like our own, yet nowhere was the slightest trace of any occupation to be seen. A brief note of the more salient points in its early history will render apparent how closely its civilisation must have resembled our own in Saxon times; and if the styles of building were equally similar, we shall be at no loss to understand why no traces of them remain.

Iceland was colonised in the middle of the tenth century, and so rapidly that HAROLD, in order to check its too rapid growth, imposed a fine of four ounces of silver on all immigrants. A Saxon bishop arrived in the year 981, and in 984 the first church was built. In A.D. 1000 the whole country was converted to Christianity; Benedictines and Augustinians settled, and a tribute was paid to the Roman See. It was not until 1261 that the inhabitants put themselves under the protection of Norway, and there is every reason to believe that prior to that date their civilisation equalled any which obtained among their relatives settled in England. Their manners, customs, and mode of life were probably identical, and of these their Scalds have left an almost uninterrupted record from the golden age of HAROLD, *aux beaux cheveux*, to late historic times. We have, in addition to direct evidence that these have never undergone much change, collateral evidence to show that the habits and customs of the population are

still substantially the same as they were in the tenth and eleventh centuries. The ordinary Iclander has no towns and no centres of reunion; he lives alone, whether priest or peasant, and when he meets his distant neighbours it is by accident. The people, though nominally under Denmark, have never been called on to supply either soldiers or sailors to the Danish services, and until quite lately no one ever thought of wandering outside his native land. There are even now no roads or bridges, and the country consists entirely of narrow valleys, separated by mountains or hills averaging 1,200 to 2,000 feet high, each valley being the bed of a torrent, often difficult and even dangerous to ford. The Norse language, which was carried to Iceland by the colony of noble families who first settled there, was spoken with conservative elegance, free from any mixture of foreign idiom. While, in course of ages, it became modified on the mainland, it was preserved in the interior of Iceland in all its native purity, so that even as early as in the twelfth century the language of the ancient Sagas was spoken of as Icelandic. Under the primitive conditions and habits obtaining in this isolated country it has remained undefiled and pure, indeed there is no priest, or peasant at the present day in Iceland who cannot understand perfectly the language of even the most ancient of the Sagas. The relationship between modern Icelandic and the Saxon element of the English language is still to be traced, for, though marked by wide divergences of spelling, a great number of common words, when slowly pronounced, can be mutually understood, and a glance at the names on a map will indicate the kind of community that exists. Another example of the small amount of change that has taken place in the habits of this people is seen in the collection of native work in the museum at Reykjavik. The wood-carving, and more especially the needlework, would not, from its style, be assigned to a later date than the twelfth century, yet much of it has been executed in, and is actually dated of, the eighteenth century. Patterns originated in the days of HAROLD, and used in the Bayeux tapestry and contemporary works, have been faithfully adhered to, and handed down from generation to generation without the smallest change in style. The costume of an Iclander even now, except at trading stations, is of home-made frieze of an uniform brownish tint. The women display a somewhat greater variety of colour, but all alike wear a peculiar black fez cap and long tassel. They have a gala dress, handed down as heirlooms in families on account of its costliness, the head-dress of which is a small white Phrygian bonnet, the lappel of which is stuffed and stiffened like the crest of a helmet, decorated with silver frontlet and ornaments, from which depends backwards a long lawn or lace veil. This dress must be of extreme antiquity. Other instances of the conservancy of the Iclander might be adduced were it not almost superfluous to do so here, the dwelling-house being the point in view. The probability is great that the Iclander has been as conservative in the plan and build of his dwelling as he has been in his language and his art. Nothing can, in fact, be well imagined that could have modified it, for Iceland remained so isolated until the introduction of steam, that when Sir JOSEPH BANKS, P.R.S., visited it towards the close of last century, money was almost unknown, and traffic was entirely carried on by means of bartering coarse home-spun cloth, dried fish, &c.

The typical Icelandic house, or *baer*, as it is termed, is constructed either entirely of earth or of earth and rough stones in layers, and has a turf roof, made waterproof by a lining of birch bark or straw. It is far, however, from a mere earth cabin, and has an intricate arrangement. Very little wood is used in its construction, as the country is destitute of timber, for it is not only costly but difficult to transport from the seaports in a land where any approach to a wheeled vehicle is unknown, and the baulks or logs have to be dragged over mere tracks at the heels of the sturdy little ponies through whom locomotion is alone possible. The rafters and lintels, however, are of wood, obtained somehow, and the floor of beaten earth. A well-arranged dwelling consists of seven houses side by side, each under its own peat roof, and with walls 4 or 5 feet thick. Those towards the centre are the largest and loftiest, consisting of two floors, with one room to each. These are the dwelling-rooms, and possess but one door in common. The entrance opens on to a dark and low ante-room (*beardyr*), on the left of which is the guest chamber (*gestaskáli*). The inmates usually sleep in lofts under the roofs, reached by ladders, and some-

times situated over the cow-house for warmth. Not infrequently, however, the dwelling-room (*badstofa*) is in rear of the other buildings, and is reached by a long dark passage 50 to 80 feet in length. It is a large and gloomy apartment lighted only by small holes in the side or roof, round which turf bunks are arranged, as in emigrant ships, in which the family and servants of both sexes sleep. The kitchen is a much smaller apartment, some flat stones on the ground serving as a stove, while a hole in the roof, with the sides carried up to promote draught, acts as window and chimney. The kitchen may be on the right of the ante-room or in rear, and there may be two state rooms in front, though this is very rarely the case. The bed in the guest chamber occupies a niche in the wall facing the front window. The low house at one extremity is the cattle shed, and at the other a store-house or smithy. A dairy and store or tool-house complete the row, these latter being windowless, while the guest room is provided with a small glazed window. In the better class of priest's or farmer's house, and every priest is a farmer save on Sunday, one room at least is wainscotted, and it is obvious that wood would be less a luxury if its cost were brought within the means of the builders. With this exception, the Icelandic house described may differ but little from that inhabited in England by the well-to-do Anglo-Saxon farmer up to the Norman invasion. The absence of any stove or fire, except in the kitchen, leads to the exclusion as far as practicable of the outer air and a crowding together for the sake of warmth. The smoke in the kitchen is generally beaten down into the apartment, and the odour is very unpleasant and everything exceedingly dirty. In the matter of keeping out wet, the Icelandic building also leaves much to be desired. Externally the frontage, if boarded as is sometimes the case in more recently-erected buildings, is rather imposing; but the simpler and smaller houses, mere cabins, may be almost ridden over unintentionally when descended upon from the slope of a hill, owing to their grass-green roof and low elevation. Every farm stands in an enclosed piece of ground, surrounded by low turf walls, called the *tún* or town, which provides the winter's hay, while elsewhere cattle and sheep seem allowed to browse at will.

There are, of course, stone buildings in the capital for the use principally of Danish officials; the Danish trading stations are ordinary wooden houses. Here and there a rich man, who has combined trading with farming, has had a complete house shipped from Europe; but these have all been erected recently, and are so exceptional that there are probably not half a dozen over the entire island, whose area is somewhere about the same as Ireland. There is nowhere any trace of the ruins of ancient buildings, and the only piece of old masonry existing seems to be the circular bath of SNORRI STURLUSON, the celebrated Saga writer of the thirteenth century. The older churches are of turf and wood, and of no architectural interest, though sometimes gaudily painted inside. There are no other public buildings, and even the Icelandic Parliament was held *al fresco* in the historic plain of Thingvállir, the deputies being housed in tents.

### GOTTFRIED SEMPER.

BY LAWRENCE HARVEY, A.R.I.B.A.

SOME thirty years ago there was in London a man who attracted considerable attention. He was known as a great artist, as a scholar of vast learning, and as a builder of barricades in an insurrection against his king and patron. The name of this man was Semper, architect of the opera house, museums, and other public buildings of Dresden, where he had been some time Director of the Academy of Fine Arts.

An exile coming to London, after such a political *faux pas*, could hardly expect to secure patrons in the Court, and yet Prince Albert took Semper under his special protection, obtained for him a professorship in the school of design at Marlborough House, commissioned him to make plans for the building of what was to be South Kensington Museum, and employed him to collect art treasures. This proves both the high opinion of Prince Albert for Semper's capacity as an artist and a teacher, and also the Prince's breadth of mind and determination to further the advance of art in England at any cost.

In the first Report of the Department of Practical Art (1853), we find a report of Semper on the armoury of Windsor Castle,

which was prepared with a view to borrowing some of the most interesting pieces for the South Kensington collections. He points out therein that nowhere is purity of design so well preserved as in the fashioning and ornamenting of weapons, on account of the paramount importance of their practical duties, and therefore weapons are the best of models to initiate students of design in the true principles of this art. Semper in another part of the same Report describes the course followed in the development of the art of working metal, its influence on the arts in general, followed by remarks on some of the new purchases for the South Kensington Museum.

The first Report of the Department of Science and Art (1854) contains a description of Semper's work as Director of the School of Design. He says that at first his pupils were young men who had been trained in the Royal Academy as artists, and who had acquired thereby a certain contempt for practical art. His principal difficulty was to make them understand the high importance of these practical branches, how much the general development of art depended on them, and how worthy they were of the best attention even of eminent artists. He succeeded in stimulating his pupils' interest by employing them to carry out his designs for the funeral car of the Duke of Wellington and other works with which he was commissioned. Later on the school of design was joined by numerous pupils belonging to the uneducated classes, such as artisans, and who followed the teaching of the museum only for short periods. With these pupils he adopted the course of throwing them at once in *medias res*, teaching them the elements of drawing and composition at the same time. The pupils on entering had no idea of perspective, and yet after a three-months' course they were able to carry out easily the most difficult perspective drawings, which, says Semper, they would not have been able to do if they had been taught in the regular systematic way. To this he added lectures, in which he showed them how all arts were governed by general laws, and the application of those laws to the divers branches of the practical arts and to architecture.

In the first Report of the Department of Practical Art, Semper lays down a general scheme of teaching for the divisions of metal and furniture designs. According to him, the teaching for the practical branches of art should follow more the type of the teaching which is given in workshops than that of art schools. There should be no division of pupils according to age or progress; the beginners must learn in the midst of the experienced workers. Studies have not to be carried on systematically, with hours or days appointed for each kind of work, but left to the free choice of the students, with the exception of such special lectures as must necessarily be given at some appointed time. The pupils were to assist the director of the workshop (this is Semper's name for a professor of art) in the jobs he has to carry out, and thereby the pupil could acquire a practical spirit as well as experience.

The objects of study were to be:—Geometrical drawing, comprising perspective, delineating of shadows, setting out of work, and modelling expounded with the help of examples, selected in such a way that the students would learn at the same time the elements of art and of construction. The study of style and styles, comprised history of art, description of technical processes and materials used, illustrated by examples, which the pupils would have to copy. There were exercises in composition and frequent competitions between the pupils, with prizes, &c.; visits to museums, workshops, and manufactories, accompanied by oral teaching; lectures on all special subjects necessary to the intelligent practice of the different branches of art, such as physical sciences, mineralogy, chemistry, &c.

Unfortunately, I believe, for English art, Semper was obliged to leave. His wife fell ill of consumption, and on her account he had to seek a more genial climate. What England lost, Zurich won, and it is owing to his influence that so small a city can hold its own against the great capitals of Europe for the grandeur and noble appearance of its public and private buildings. The municipal council of Zurich has lately decided to give to one of its public squares the name of Semper, and well it may, for Zurich bears as clearly the stamp of Semper, as Vicenza that of Palladio.

During his residence at Zurich Semper constantly regretted having left England; he wanted its vast resources for research, and dreamed of great opportunities of exercising his art as an architect on an imperial scale. How much of all this was pure

illusion, who can say? In Zurich he found the repose necessary for composing the work which will carry his name to remote generations of artists; and give him an almost unique position amongst architects.

In a few weeks a paper will be read on his famous book "Der Styl," at the Royal Institute of British Architects, but in the meanwhile it may not be useless to give some notion of his system. In what follows the principles put forward are Semper's, but for the expression of them I am solely responsible.

Semper says that art began with adorning and clothing our bodies, and branched out later on in adorning and clothing all the objects we use—weapons, tools, dwellings. It is therefore in the most primæval of practical arts that the grammar, the syntax, and the vocabulary of art have been formed, and the laws then laid down still govern all art creations.

Let us take, for example, a necklace. It is formed of two parts: firstly, a row of jewels; secondly, a string or chain to tie those jewels together. The jewels may be big diamonds or pearls of great value, which would suggest that the wearer prides herself on her wealth; they may be old Greek and Roman coins, and we would conclude the wearer a blue stocking. A young lady, the belle of the season, might adopt the device of having as centre jewel a large cameo, representing the triumph of Venus; and, for the other jewels, portraits of her rejected suitors, an idea perhaps more witty than modest, but which would leave us in no doubt as to the character of the wearer. We see, therefore, that in a necklace the jewels may have an ideal connection with the wearer, and, at all events, are the only part of the necklace where pictorial subjects may be brought in. The other part of the necklace has but one purpose to fulfil; it must remain in whatever way we may treat it a self-evident structural means of tying different objects together. We can characterise it as a ribbon, a cord, a chain; it may even be formed of cupids holding the jewels by each hand, but it can never be used as a field for pictorial representations. In this most primitive of human adornments we have at once learnt to differentiate pictorial from structural ornamentation, two elements of beauty which we will find again in all works of art—in architecture, painting, sculpture, music, and literature.

In architecture, we find the principles of our necklace most clearly applied in the treatment of the triglyphs and the metopes of the Doric temple. The triglyph is an upright support which carries the cornice, and is rightly characterised as such by fluting it in harmony with the fluted columns which support the whole of the entablature. The metopes or spaces between the triglyphs have no structural functions to fulfil, and therefore can receive pictorial subjects relating to the destination of the building they decorate.

In painting we have the jewels and the thread in every picture which deserves the name of a work of art; diagrams however correct, are not included, but only paintings which are pictures because they are decorations. It would be easy to show in the landscapes of Claude, Turner, or Constable, the jewels which give their pictures their deep interest, and the thread that is the background, the foreground, and the accessories which bind these jewels in one whole so as to form them into a picture.

In sculpture, the statue is often a jewel unconnected to any other object by an artistic string; but when drapery is called into play, we often use it as a means to connect one figure with the past or the future, thanks to the flowing folds; at all events the serpents of the group of Laocoon are a most remarkable piece of artistic cord.

In music, it seems to me, one may find the necklace of jewels tied together by a thread, but my technical knowledge of this art is too small to dare venture on a closer analysis, and I will leave the subject to be dealt with by a more authorised person.

In literature, the greatest trouble I experience in writing is the difficulty of stringing together my ideas; the jewels are ready at hand, but a good string, well suited to its work, is hard to find. Dickens is exceedingly clever in shaping the string which connects his valuable jewels, the undying characters which have become the household words of the English language. I remember one case in "David Copperfield" (by-the-by, David belongs to the string, not to the jewels), where Little Em'ly runs out on a projecting beam over the sea, to the peril of her life, and he adds the reflection:—"There has been a time since when I have asked myself the question, Would it have been better for Little Em'ly to have had the waters close above her head that morning in my

sight? and then I have answered, Yes." This is a piece of string with a vengeance, by which he at once invests Little Em'ly with dramatic interest and rivets our attention on her all through the piece. There are many other finesses of composition in Dickens for which I could find an equivalent in architecture, but I fear to be prolix and tire my readers.

I hope that the little I have said on Semper's ideas will suffice to awaken the interest of readers, and serve as a prelude to a resurrection of his teaching in England, which he should never have been allowed to leave. But before I close there is a curious coincidence which I should like to point out. Semper first gave out his theory of the art of clothing as the basis of all art about the year 1831. Carlyle, well versed in German affairs, wrote his "Sartor Resartus" in 1832. Is it not possible that this book is a skit upon our author's ideas, and that the original of Professor Teufelsdröckh is our friend the late Professor Semper?

## THE ARCHITECTURAL ASSOCIATION.

THE annual conversazione of the Association was held on Friday evening, the 10th inst., at the galleries of the Royal Institute of Painters in Water-Colours, upwards of twelve hundred being present, including ladies and gentlemen. Special arrangements were made that no hitch should take place in the service of the cloak and hat department, and that the visitors on their arrival and departure should not be delayed. It was also found unavoidably necessary to limit the number of invitations, instead of, as heretofore, inviting all Fellows of the Institute of Architects and other old friends.

The President, Mr. COLE A. ADAMS, took the chair in the Prince's Hall at 9.15, and distributed the prizes as follows:—

*Travelling Studentship.*—First prize and medal, to Mr. G. J. Oakeshott; second, of 5*l.*, to Mr. G. G. Woodward; honourable mention, Messrs. W. A. Bidlake, G. G. Wallace, and E. H. Selby.

*Association Medal.*—Mr. Arthur Sykes.

*Class of Design.*—First prize, Mr. C. C. Bradley; second, Mr. F. S. Granger; honourable mention, Mr. W. Dewes.

*Elementary Class of Design.*—First, Mr. F. M. Day; second, Mr. A. H. Hart; honourable mention, Mr. Ferguson.

*Colour Decoration.*—Mr. A. W. Hemings.

*Architectural Union Prizes.*—First prize, Mr. S. H. Seager; second, Mr. F. Massie. A third prize was specially presented to Mr. H. P. B. Downing.

*Planning and Specification.*—First, Mr. E. A. W. Barnard; second, Mr. M. Collins.

*Sketch Book Title-page.*—First, Mr. W. A. Pite.

*Essay Prize.*—First, Mr. E. P. Tucker.

*Lectures on Construction.*—First, Mr. N. Nisbett; second, Mr. H. S. Saunders; third, Mr. J. W. Stonhold.

*Lectures on Architecture.*—First, Mr. G. McCombie; second, Mr. H. Abraham; third, Mr. N. Nisbett.

### President's Address.

The PRESIDENT then delivered his address, in the course of which he said:—

It is one of the obligations of the office of President to deliver an address on the occasion of the annual conversazione, and one of the obligations you have entered into this evening by the attendance you have honoured us with to listen to it. I see no escape for either of us. I will endeavour, however, to be as brief as possible, so as not to weary; and you, on your part, will kindly extend to me your patience for a short time before adjourning to lighter and more congenial amusement. You have just witnessed a ceremony which, I hope, has interested you; the awards of merit have been made more valuable to the gainers of them by your generous applause, and that touch of sympathy which every one values. The ceremony of bestowing the prizes has been a very short one; but it has taken a year's work to win them. On the walls of the gallery above you will see something of the labour involved, and I hope you will not leave this evening without at least a glance at them. You will see how much labour it takes to win distinction, and obtain some idea of the study required to make an architect. What you will there see is but a fraction of what is necessary for that purpose. The Architectural Association was established several years ago for the object of mutual improvement and instruction in the art of architecture, and upon a voluntary basis. The senior members impart instruction to the juniors, who in their turn become teachers. We have lectures, classes, discussions, and exhibitions for the study of design and construction; and in our ranks are all sorts and conditions of men, who go to make up the profession. Among them are those who are in practice, but who retain their names on the list of members from the affection they bear to the society, which has aided them in their work, and the desire to keep touch with those who yearly join it, and many remain in the ranks to render help in the work carried on. Others—and a large proportion—are in offices as assistants, anxious to avail themselves of the instruction to be

obtained at a very small cost; and, lastly, we have yearly drafts of young men who are serving their articles, and have just entered on the duties of the profession they have selected.

The advantage of this chain of connection from the first link to the last is obvious, and the creation of an *esprit de corps* and kindly sympathy which is most advantageous. We claim that the Architectural Association is a unique body, doing valuable service to the public and to the profession, breaking down the barriers of little jealousies, and forming that union which is strength. Among the senior members are those who have tried their armour in the conflict for fame. Many of us have had to confess that it has been found sadly wanting, some have been more fortunate than their fellows, but, if their career is closely watched, it will be found that honest, hard fighting with the obstacles and enemies to success has led them to victory. Others there are who, from one cause or another, have never succeeded in rising from the ranks, and yet have, as good soldiers, done their duty fearlessly and well; and who, through good and evil report, have fought on or worked in the trenches during a campaign, often dreary and disheartening, through long winters of discontent, it may be with odds against them which have been all too much. It must needs be so; all cannot win in the race or take even a second or third place, and yet may still bravely do their duty and win the highest commendation, from the fact that they have done their best. Lastly, we have those on the threshold of life entering on a laborious career, full of hope and trust, eager to succeed. To them at present all is sunshine, and the troubles, disappointments, and anxieties of a professional life have not thrown their dark shadows across the path to fame. To their eyes are presented visions of the magnificent buildings they will be called upon to erect—cathedrals and churches of noble proportions and gorgeous colouring; castles and mansions for the noble and wealthy; civic halls and buildings to grace our towns. Mirages too often these visions prove to be to these travellers through the desert; but it is well that they should start with a high ideal; all is possible to genius, combined with hearty untiring zeal and worth. Too soon bitter experience will teach its lesson, but youth without such healthy ambition can never succeed, and from these ranks of young and hopeful recruits must come the architects of the future, be they members of our body or not. Dame Fortune sits on her gilded throne, and has not exhausted her supply of wreaths for the victors; let us wish them God speed, and be careful to throw no discouragement on honest efforts to gain reward and distinction.

To those who have given any attention to the study of architecture, the progress of late years must be apparent. A glance only at the exhibits in the galleries upstairs, so kindly and generously lent to us for this evening, and contributing so largely to the enjoyment of it, will go a long way to prove this assertion. These exhibits, it is true, are only accessories to architecture, but they are the outcome of the improvement which has taken place of late years. Many of the objects on view are designed by architects in practice, who are members of this Association, and all the exhibits will repay your careful examination. It is too much the fashion to sneer at modern architecture and those who practice it; but let anyone whose eyes are not hopelessly blind examine with care and attention the buildings, both ecclesiastical and civil, which have been erected during the last quarter of a century, and one may go further back than that. The Gothic revival has produced men who have covered the land with churches and buildings, many of which are masterpieces of design, and which, I venture to think, future generations will do greater justice to, and treasure them as precious legacies. The works that will live are the creations of minds which have devoted their lives to the study of their art; men who have unceasingly toiled to learn their craft, and who have ransacked the treasures of the past with an absorbing love for the work, which is above praise. There are very few old buildings in this country, or on the Continent, that have not been visited, and careful drawings made of such parts which would serve for study and be useful in practice. That the result of this should be a too close resemblance to ancient architecture as to justify the charge of forgery in many cases is natural, but in the works of the best masters and by their works progress in modern architecture should be judged; you will always find originality and a distinct adaptation of forms to modern usages, and anyone well acquainted with old work will at once distinguish and appreciate the merits of the modern. The old Gothic architects were just as much copyists as the modern ones, or else how is it that the same plans, the same features, the same forms, and the same mouldings may be traced in buildings, from one end of the country to the other, and in far less variety than you see now in modern work? The great advantage the old builders possessed over ourselves was that they were happy in living in an age when they could practise their art in one style, and so bring it to greater perfection. Changes came very slowly to them, and men were left more to the quiet contemplation and development of their art, and to practise it free from the competition, rush, whirl, and excitement that attend upon us moderns. So much of the charm of old work lies in its antiquity, and in the sentiment that surrounds it. Time is a skilful artist, and with loving hands colours the walls and roofs, gently tones down the

interior, darkens the woodwork, knocks off sharp edges, softens and refines any crude contrasts, and produces generally that charming *ensemble* we call picturesque. There are many old buildings which, if the magic wand could pass over them and change to what they were when the builders left them, would be passed by as unworthy of notice. Do not think for one moment I am drawing comparisons to the disadvantage of the past; far from that is my intention; but I plead for a fairer and more honest examination and judgment upon the work of the present, and for greater discrimination. I do not assert that the Gothic revival has produced work so grand and noble as the source from which it has sprung; the wonder is that such progress towards perfection has been made amidst difficulties which only those who adopt our profession can have any distinct knowledge of. What has been done in time past it is possible the world may see again, and with the progress that has undoubtedly been made of late years it is too Utopian to hope that buildings shall yet arise which shall be a delight and wonder to coming generations?

The hope of modern architecture rests much with the public. It is sad to find how people, as a rule, care little for architecture at all, and yet how lavish many are in expressing their opinion about it. The facilities for travelling afford opportunities for visiting edifices which are the admiration of the world. But they are not studied by the mass; hasty judgments are formed and opinions expressed, borrowed chiefly from writers, good, bad, and indifferent. Such people fail to see the lesson taught by what they have visited, and to analyse the reasons for their likes and dislikes. Education is making rapid strides in every branch, and may be in time a more intelligent reasoning will take the place of the indifference to the study of architecture which characterises us as a nation. Should that time come, when architecture shall be studied with delight, then the sure outcome of this will be a revival which shall eclipse all our previous efforts. Has not the increased and increasing cultivation and love of music resulted in extending, to an unparalleled extent in this country, the practice of it, so that it can no longer be said that we are not a musical people? Have we not now discriminating audiences who listen with ever-increasing delight to good music, and who create such a demand for it that the supply comes, and throughout the length and breadth of the land people flock to hear the masterpieces of composers superbly rendered by artists who, unless they are excellent, get but a scant hearing? Note, too, the progress made in the drama, and the high position in cultured society that the professors of both arts now take, and how keenly their careers are followed and watched. Such interest is highly appreciated by those who minister to the tastes and recreations of the people, and the greater the interest taken, the greater is the effort to be worthy of it. The musician or actor who appears before an audience capable of understanding and sympathising with his interpretation of the part he is performing, puts forth all his best efforts, and gives the result of long and patient study, the only passport to success. The art of painting, too, is better understood than it was. The education afforded by the numerous illustrated works which yearly teem from the press have been fruitful in their teaching. The instruction given in drawing and painting at so low a charge as to place the learning within the reach of most, has doubtless largely contributed to advance this art, and the opportunities afforded by the numerous art exhibitions and galleries all over the country have, in a thousand ways, helped to cultivate the national taste. Sculpture, that sublime art, is less understood, less sought after, and, as a consequence, less practised. To produce a masterpiece, perhaps, requires the very highest artistic and intellectual capacity; but, unhappily, so slight is the encouragement given to the art in this country, that few have heart or courage to devote their lives to the study of it. If, as the wheel of time goes round, men will turn to the study of architecture, they will become more critical in their judgment, and demand a higher standard of design and workmanship than they do at present. They will seek out for employment only those architects who are architects in deed as well as in name. It is one of the misfortunes of the present time that anyone may call himself an architect who likes, and yet may be, and often is, incapable of exercising his profession.

If the public only would exercise a wider discretion, and seek out the men who are capable of designing and carrying out the buildings themselves, much that is so bad in architecture would cease off the face of the land. In time, perhaps, a diploma will be granted to architects who are able to satisfy the examiners that they are men skilled in the art. Such a course would be a guarantee to the public, and shut out men who have no sort of right to be trading on the ignorance of their employers. A step in this direction has quite recently been taken, and no man can now become an Associate of the Royal Institute of British Architects without passing an examination; make it compulsory that no man shall practise without this test, and improvement will take place. Such a step might not produce all the results hoped for from the artistic side; that difficulty must one day be met by a college of architecture presided over by distinguished professors; but from the practical side great good would follow. Buildings would be erected that would be better in construction and planning, and in that most important condition, better in their sanitary arrangements. With the responsibility which a legal status would give,

some obstacles would be raised up against speculative building which, as at present practised, is such an absolute disgrace in too many instances to the architecture, if it may be called so, of this country. As long as the public are content with the present state of things, there is no remedy possible, but in all fairness they should be discriminating in their censure of architects and their work, and not judge the architecture of their time from the houses most people are compelled to inhabit, which are, for the most part, the creations of men sadly ignorant of design and plan. Let a taste for architecture be cultivated, then a demand will arise for good and intelligent design, and there is the material always at hand to meet the supply. Signs are not wanting that a taste for architecture is being more extensively cultivated, and the more we as architects can foster this taste the better will it be for that art which is the mother of all the arts of the craftsman. Let but the public learn discrimination, and our cities may yet be made beautiful, and the sister arts of painting and sculpture sought after for the adornment of the fabric. Let but encouragement be given in high and influential quarters, and the painter will be tempted from his easel to learn the craft of architecture, and with knowledge to apply his brush upon the walls of buildings, and the sculptor to leave his studio and embellish the fabric with lovely forms. There is now a want of touch and sympathy between architects, painters, and sculptors, which affects most seriously the highest development of the arts; but in this aspect, too, there are cheering signs, and one may point with pleasure to the walls of South Kensington Museum, and anticipation will be eager to see the result of the intended decoration of St. Paul's by two of our great modern painters, combined with the work of a member of our own body for the architectural treatment. The opportunity should not be missed of inspecting the experiments which are now on view in that splendid monument of Wren's genius.

An address on an occasion like the present should, I believe, touch upon recent events. Last year your attention was called to the competition for the new Admiralty and War Offices. Now we know the award of the judges, and I believe I am right in saying that their verdict has been generally endorsed. Of the fairness that has characterised the whole adjudication, I do not think there is any reason to doubt; of the various merits of the designs, opinions are sure to differ. It is a very great pleasure to the Architectural Association, that one of their past presidents, Mr. Aston Webb, in conjunction with one of their friends and lecturers, Mr. Ingress Bell, obtained the most honourable distinction of selection in the final three. They have merited and have to the full, ours, and I am sure I may add, your, heartiest congratulations. The winners of the prize, Messrs. Leeming, of Halifax, comparatively young men, and before this unknown to the general public, deserve also recognition for their splendid drawings.

Touching the question of competitions, let me add that during the past session an Association of Architects has been formed, including nearly all the leading men, who have undertaken *not* to compete unless a professional assessor is appointed to guide the promoters of competitions in their selection. The general fairness of this principle cannot, we think, be disputed. Is it not only right that when men, in the hopes of winning a prize, devote their best energies to the perfecting of their designs, that they should have the justice dealt out to them of a skilled professional man to weigh the merits of their work, instead of leaving the selection alone to a body of laymen who, however disposed to act fairly, cannot possess that knowledge of the art or technical skill to decide upon the rival merits of the designs submitted? That universal satisfaction to all parties will be the result of this movement is too much to hope; but that justice is far more likely to be done, and the most deserving design selected, may, we believe, be confidently expected in the majority of cases.

Of the phase that architecture in this country is passing through at the present time, and to what it is tending, it is difficult to speak. In church architecture we see signs of a return to a style which a few years ago was considered too debased to follow. But some of our most eminent practitioners are never tired of insisting upon the merits of the Perpendicular period, and have shown by their works how, in skilful hands, buildings full of grace and beauty may be erected, admirably adapted to their purpose. The revival of brick architecture in the style which, for want of a better name, we call Queen Anne, is still in full vigour; but to the observing eye a change towards a purer phase of the better periods of the Renaissance may be traced. The advantages of this style for domestic and civil buildings have been made abundantly manifest, and we are now in possession of edifices brimful of piquancy and picturesque effects, admirable in planning and arrangement. The danger of this style lies perhaps in its want of defined principles, and the licentiousness which is the natural result. Extravagance in forms, senselessness in designs, a too great straining after effect, a want of repose, an absence of harmonious simplicity and grandeur, too often spoil much of the work that one sees, and this is a drag upon real progress. Such architecture presents unhealthy teaching to the young student, who is naturally impressed with the everyday influence he is brought in contact with, who, seeing that such design is the fashion, neglects the study of those masterpieces of his art which he should study as the classics of it. The violent phase of the Queen Anne mania is a great deal the outcome of

modern æstheticism, which has come in these days to mean the worship of blue china and bric-à-brac; the rage for Japanese art, and the frequent adoption of the saddest and most dreary of colours for the decoration of our houses; in painting the portrayal of figures, often exquisite in form, but of sex doubtful—dressed in sad-coloured garments, with mournful and consumptive-looking faces, giving one the idea that the artists had sought their models from the hospitals; they are generally depicted in shrinking attitudes, and with close-clinging, transparent, diaphanous drapery, which gives one the impression of having been put on damp, causing those ailments which their faces tell the story of, and this damping process also seems to have had a disastrous effect upon the colours, which have a washed-out appearance, in striking contrast to the pictures of healthy-looking men and women whom artists in another age delighted to portray. Many of these pictures are undoubtedly of the highest order of merit; but is not the following of this purely ideal school of painters death to healthy progress? Take the works of the grand old masters of the Renaissance school, who went for their models direct to nature, and investing them with the poetry of true genius have given us subjects for delight and instruction; their canvases breathe with healthy life and happiness; we see in them men and women who lived and did their part in the days in which they lived. The pursuit of art on these lines is surely more robust and therefore more healthy. The pursuit of art on the other lines, neglecting the teaching of healthy nature, has a tendency to decay. In the hands of a few, beautiful results of a certain kind are found, but the following of such masters cannot be otherwise than a mistake, in my opinion. Much of this kind of painting is already disappearing, and our picture-galleries show a return to nature, who is ever bountiful, and ever renewing her work with lovely models for the painter's art. We have in our midst artists who have never adopted the consumptive model, but have given us delightful creations of fancy, which have made the human form more lovely to our eyes, and invested sea and sky and earth with charms and teachings which we had never dreamt of before. Art is emerging on all hands towards a brighter and stronger ideal, which, let us hope, will yet produce great and mighty results. We must take to heart the consolation which every street boy and barrel organ is so fond of impressing upon our attention, and "Wait till the clouds roll by," and disclose the genial sun, giving health, life, and increased happiness to toiling man. With this wish, and with a hearty welcome as the mouthpiece for the time being of the Architectural Association, I must conclude, praying your indulgence for this address, and your forgiveness for the many shortcomings with which it is, I fear, all too full. The work of an architect lies more in his pencil than in his pen, and our shortcomings as public speakers should be more gently dealt with than those of men trained in the art of composition and debate. Our efforts must bend to the fulfilment of our motto which you will find on your programmes to "Design with beauty, build in truth." By our works we must stand or fall—poor dumb mouths, and bid them speak for us.

The prize drawings of the students were exhibited, and a series of plates contributed to the Association sketch-book, water-colour drawings by Mr. R. Phene Spiers, and Mr. Stannus' drawing of his modification of Alfred Stevens' design for the decoration of the cupola of St. Paul's.

The exhibits of art furniture and decoration this year engaged the special attention of the company, surpassing even previous years in excellence and variety. The ornamental wrought ironwork of Mr. A. Newman, of Maddock Street, was particularly worth notice. Space will not, however, allow of more than giving the names of the firms who lent their valuable exhibits for the occasion, as follows:—Messrs. Jackson & Graham, Morris & Co., Cox, Sons, Buckley & Co., Coalbrookdale Company, Trollope & Sons, Woollams & Co., Jeffrey & Co., Hart, Son & Peard, Richardson, Ellson & Co., Salviati, Longden & Co., London and Sheffield; Collinson & Lock, Holme & Co., Shuffrey & Co., Doulton & Co., &c.

The programme of music for the evening was executed under the conductorship of Mr. W. Winterbottom, by the band of the 2nd Life Guards, and all the arrangements for the visitors were excellent.

## EARLY CELTIC MONUMENTAL INSCRIPTIONS.

THE first of this year's course of the Rhind Lectures in Archæology was delivered on Monday afternoon in the Masonic Hall, Edinburgh. The lecturer was Sir Samuel Ferguson, President of the Royal Irish Academy, and the subject of the course is "Early Celtic Monumental Inscriptions—The Ogham."

Sir Samuel Ferguson observed at the outset that the only Celtic monumental inscriptions which could be said at the present day, as a class, to need further elucidation, were those conceived in the Ogham form of writing. He should, therefore, be concerned in the present inquiry with the Ogham variety, and such topics as legitimately associated themselves with it. Monuments so inscribed existed in great numbers in Ireland. There were

eighteen in Wales, two in South England, five in the mainland of Scotland, and four in the Orkney and Shetland Islands. The key to their reading has been traditionally preserved in Ireland, and could be reconstructed, if necessary, from the Roman epigraphs which accompany and echo them in the biliteral monuments of Wales. He did not say bilingual, for the subjects of the texts were almost exclusively proper names, connected by the word *Miqi*, meaning "son of." Although a series of proper names was not calculated to excite much interest in the abstract, there were various historical and palæographic considerations which give these monuments a claim to the attention of British archæologists not much inferior to that of the Rune for Scandinavian scholars. The Ogham is of the same family with the Rune, the characteristic of both kinds of writing being the employment of straight strokes, easily carved on wood or stone, for forming the alphabetic letters. The original Runic alphabet, however, is not, like the Ogham, of a cryptic nature; but it is the foundation on which the cryptic Tree-Runes, having several points of resemblance to the Ogham, are founded. Rune, in the Northern languages as well as in the Celtic, signifies something secret; but the Futhorc or Scandinavian alphabet cannot be said to be more secret or mysterious than any other, and if it bore the name of Rune in its original state, it was because alphabetic writing of any kind was deemed a mystery among the northern populations to whom it was first imparted, or amongst those by whom it may have been invented. The Tree-Rune, however, founded upon it, is a designedly secret and highly artificial kind of writing. The lecturer proceeded to contrast the Runic Futhorc, or alphabet, with the Irish Bethluisnion—an alphabet designated altogether by names of trees, but represented in its Oghamic equivalents by straight strokes, the significance of which depends primarily on a division of the Bethluisnion into like categories as the Futhorc, with this difference, that, in preparing the Bethluisnion for its relations with these equivalents, it is divided into four categories of five each. The Futhorc is arranged in three divisions. The relations of the Ogham to the Rune were further traced. Speculating on the origin of the Ogham, he observed that if the Ogham be not founded on the Roman alphabet, renamed and remarshalled into the Bethluisnion sequence, the inference at this stage of the inquiry would be that its many resemblances to the Tree-Rune connect it with the North of Europe, or with the source from which that region received its letters. The account which the Irish themselves give of it is, that the Ogham was brought in by the early half-mythical colony of the Tuatha-de-Danaan, whom they bring from the northern parts of the world through Scotland; and they allege that Cucuinne, fifteenth in descent from Milesius, who overthrew these Tuatha, was the first who used it in chronicling events. There is one feature, which the lecturer described, in the Ogham which seemed to establish that its framers were of the Latin rather than the Teutonic branch of the Teutonic family. If derived from the Rune, the framers of the Ogham had not succeeded in improving on the original, either in perspicuousness or fitness for monumental use. The Ogham is very much more cumbrous than the Futhoric, and, notwithstanding the apparent simplicity of its arrangement, has an inherent element of uncertainty unknown, he believed, in any other alphabet. Sir Samuel Ferguson proceeded to show how the Ogham was much more liable to error than the Rune, and pointed out how the difficulty of accurate transcription and other causes cast during a long period the study of the Ogham by scholars into disfavour. With many cases of uncertainty as to the actual existence of inscriptions, or the possibility of transcription, before them, it was not surprising that scholars fifty years ago looked on Oghamic investigation as an unpromising subject. But the lecturer described the change that soon set in, and showed how that one of the great Irish scholars—O'Donovan—who had shared the doubts referred to, had to acknowledge, when he found himself under the Ogham-inscribed roofing-stones of the cave of Dunluc, that he stood in the presence of a long past age, speaking to us by intelligible, articulate signs. While the Munster antiquaries were adding to the number of their discoveries of Ogham monuments, but not advancing in the accurate transcripts or reliable inductions, the Rev. Dr. Charles Graves, now Bishop of Limerick, subjected the Ogham texts, so far as he could be assured of them, to the process which may be termed the cypher test, assuming them to be written in the Irish of our oldest manuscripts. The proportionate percentage of each letter in the known text identifies the corresponding letter in the cypher. On this principle, it appeared that the traditional key was in substantial accordance with the theoretic values of the letters so deduced, and Dr. Graves entered on further Oghamic inquiry with the assurance that he proceeded on firm ground. Shortly afterwards he was rewarded by the discovery of the biliteral monument at St. Dogmael's, in Wales, where the *Sagramni fili Cunatami* of the Latin is echoed by the Oghamic *Sagrani Maqi Cunatami*, putting the equivalence of *Maqi* to "son of" out of the way of doubt or question. Speedily other discoveries followed. It was ascertained that the Scottish Newton stone, besides its seemingly Romanesque epigraph, bore a long Ogham inscription, and that other Ogham inscriptions existed both in Wales and Scotland. One from Bressay, in the mainland of Shetland, was submitted to Dr. Graves, who found that the language was Norse, and that it seemed to commemorate a

daughter and grandson of a known Scandinavian personage of the ninth century. After speaking of the labours of other scholars in this work, and the attention paid to it by the Royal Irish Academy, the lecturer, in conclusion, said the main questions now agitated are—Whether the Ogham is of Pagan or Christian origin; whether, if of Pagan origin, any of the monuments are Christian; whether the Welsh imparted it to the Irish or *vice versa*; and whether its forms belong to a vernacular or to an artificialised language. He should not be able definitely to clear up the meaning either of *Maqi mucoi* or of *Maqi decedda*; and he should have to leave the question of Irish or British, as well as of Pagan or Christian, origin dependent on the question of language, which he did not profess to solve. He should often have to say "perhaps," and often to present alternative conclusions. He should be able, however, he thought, to satisfy them that the bulk, if not all, of our Ogham monuments were Christian; that some of them represent as old a Christianity as had ever been claimed for the Church in either island; and that the *Scoti in Christo credentes*, to whom Palladius was sent by Pope Celestine in the fifth century, were, especially in the south of Ireland, a more numerous and better organised community than had hitherto been supposed. He should, he thought, bring Irish Pagan and British Christian monumental usage into actual contact with Wales and contribute something towards the further elucidation, as Christian monuments, of the sculptured stones of Scotland. The lecture, which occupied upwards of an hour in delivery, was illustrated by diagrams and casts of several of the most interesting of the Ogham inscriptions that had been discovered in Ireland.

#### YORK ARCHITECTURAL ASSOCIATION.

ON Saturday last, on the invitation of the President and Council of the Leeds and Yorkshire Architectural Society, the members of the York Society visited Leeds, and paid a series of visits to important architectural works now being or recently carried out. Amongst those visited were the Coliseum, the Yorkshire College, and the Hook Memorial Church. The party on arriving at Leeds were met by Mr. Edward Birchall, F.R.I.B.A., Mr. Chas. H. Thornton, hon. sec. of the Visit Sub-Committee, and Mr. W. Hoffman Wood, who conducted the members to their rooms in Albion Street, where refreshments were partaken of, and after an inspection of the museum had been made the party proceeded to visit the Coliseum, where the York Society were joined by the members of the Leeds and Yorkshire Architectural Society. An inspection was made of the large building. The assembly next inspected the chief object of the visit—the Yorkshire College. The party, on arriving at the College, were met by the clerk of works, Mr. Batty, who very cordially conducted them over the many and varied departments of the College, which have been designed by Mr. Waterhouse, A.R.A. The company also visited the Hook Memorial Church and St. John's Church. We understand that the York Association has invited the members of the Leeds Society to visit York on Saturday, the 25th inst.

#### WINDSOR FOREST.

AT a recent meeting of the Windsor and Eton Scientific Society, the Rev. Dr. Gee, vicar of Windsor, read a paper on "The Trees of Windsor Forest." In the course of his remarks he said our knowledge of the Forest dated from 1820, when the present arrangement was introduced. In 1814 Kent reported that there were 50,000 good trees, yielding a million and a half cubic feet of timber; 1,900 acres were sold, 25,000 $\frac{1}{2}$  worth of timber cut down, and 3,000 acres planted. The Great Park now consisted of 3,000 acres, the Little Park of 500, and the Forest of 10,000 acres. The soil was poor and wet, and little to be envied by agriculturists. Of the three principal trees—the oak, the beech, and the elm—the oak might be claimed as an aborigine, although much of the old oak timber in this country was not of the same kind as that now in use. The beech tree claimed as its own the neighbouring county of Buckingham, to which it gave its name, as well as to "book" and to "bacon." The elm was the shortest-lived of these three trees, its limit being about 200 years, while it began to decay at the age of 80 years. The trees in the Long Walk were planted in 1680 by Charles II., and the Walk was perfected by William III., though the ground was not appropriated until the reign of Queen Anne. The number of the trees, which, though very fine, were inferior to those at Eton College, was said at one time to be 1,652, the double avenue being 70 across. The finest-grown oaks were at Cow Pond, just at the back of the Rhododendron Walk. One was 70 feet high, and rose 40 feet before it threw out a single branch; and there was a tree 100 feet high near Cumberland Lodge. In Cranbourne Chase stood the largest tree known in the Forest. It was hollow, and might have existed 800 or 900 years, its greatest circumference being nearly 40 feet. Outside the Forest Gate, at Ascot, was a fine specimen of a tree of middle age. It was in about the 600th year of its life, and was about 27 or 28 feet in circumference.

## NOTES AND COMMENTS.

AMONG the impediments to the professional organisation of architects is the condition of local societies. It may be safely asserted that there is not a society in any town in Great Britain which adequately represents the strength of the architects in the town. There is always a great difference between the number of practitioners who are eligible for election and the number of members. A committee of the Northern Architectural Association have been considering the subject, and they are of opinion that an energetic endeavour should be made to induce the whole of the practising architects in Northumberland and Durham who are not yet members to join the Association, with a view to its becoming thoroughly representative, and to its carefully preserving and advancing the interests of the profession, encouraging and developing all matters relating to art and science, and giving substantial inducement in the way of prizes to the younger members to perform good work. The best way to attain that end, in the opinion of Mr. OSWALD, one of the members, would be by removing to a more suitable place for meetings, and by forming a library and museum. Books and collections of casts are costly, and we doubt if they are always attractive. If some of the members would propose the experiment of meetings less formal than those which are held in Newcastle and elsewhere, there might be more chance for the Association. But so long as it is supposed to be incumbent on members to compose a long paper, it is not surprising that men eschew societies.

THE foreign visitor to Edinburgh can hardly fail to be amazed at the law which has allowed what is probably the most beautiful street in Europe to be injuriously affected by the Waverley Railway Station. In London there is much to condemn in the structures which have been raised by railway enterprise, but as the surroundings in the metropolis are less picturesque than in Edinburgh, the contrast is not so remarkable. It is now proposed to "improve" the Waverley Station, but so far as can be judged from the description, all that is to be done is to construct new sidings, platforms, and approaches. We are told that already there is a new "handsome signal-box," and that "an effort is now being made to remove the ugly aspect which the parcels' office on the Waverley Bridge has hitherto presented. The tumble-down appearance of this block has been an eyesore for years. The walls are now being renovated, portions of them being in course of removal and reconstruction; and detailed ornamentation of the windows and corners and of the elevations generally will put the building in harmony with the goods office at the extreme south end of the bridge." But no vamping can transform the parcels' office into an object that is worthy of its position. It should be removed without delay, and if one has to be placed in the same place, let it be one that has been designed by an architect. There is a Cockburn Association in Edinburgh, but the members appear to be as much afraid as other men of interference with railway prerogatives.

ONE of the customs of the brickmaking trade was exemplified in a case which was tried a few days ago in Canterbury. Messrs. EASTWOOD & Co., Limited, who, it is needless to say, are brickmakers on a large scale, were compelled to summon one of their moulders for money which had been overdrawn. The defendant undertook a moulder's berth for the season ending September 25, with the understanding that the rate of payment would be 3s. 9d. per thousand bricks, of which sum 3d. per 1,000 was to be retained as "pence money." He made 449,000 bricks during the season, but had drawn payment for 469,000. The defendant's answer to the case was that the "pence money" retained by the plaintiffs was more than sufficient to meet the 3l. 10s. overdrawn. It was admitted that the "pence money" retained amounted to 5l. 12s. 3d.; but, by the custom of the trade, the defendant had forfeited all his "pence money" by leaving his employment before the end of the season—viz., on September 8, instead of on September 25. "Pence money" is retained as a guarantee that the moulder will continue in his employment to the end of the season, and also that he will take care of the bricks and keep them protected from the inclemency of the weather even beyond the period of moulding, until they are actually in the kiln. A man forfeits the "pence money," even if the employer's loss is less than the amount of the "pence money," but, if it is greater,

the employer can claim damages for breach of contract. The defendant's plea was that his gang had left him, but the County Court Judge said that was his own affair, and, as His Honour was satisfied that it is the custom in the brick trade for a man to forfeit his "pence money" should he break his contract, judgment was given for the plaintiffs.

THE conversazione of the Architectural Association, which was held on Friday in last week, attained the success which was anticipated. There may be larger gatherings in the London season, but in none is there apparently more enjoyment. Mr. COLE ADAMS's term of office has been satisfactory to the Society, and his address was exactly suited to the occasion. It was assertive of the rights of the younger members, without being dogmatic or unfair. The prize-list was a testimony to the zeal of the Association, and it was satisfactory to learn that only one prize had been held back this year.

THE lectures which Mr. RUSKIN will deliver this session as Slade Professor, in Oxford, will be on "The Pleasures of England," and are to form a sequel to last year's on "The Art of England." The following are the subjects:—Lecture I.—BERTHA to OSBURGA, "The Pleasures of Learning," October 18 and 20. Lecture II.—ALFRED to the CONFESSOR, "The Pleasures of Faith," October 25 and 27. Lecture III.—THE CONFESSOR to CŒUR DE LION, "The Pleasures of Deed," November 1 and 3. Lecture IV., CŒUR DE LION to ELIZABETH, "The Pleasures of Fancy," November 8 and 10. Lecture V.—Protestantism, "The Pleasures of Truth," November 15 and 17. Lecture VI.—Atheism, "The Pleasures of Sense," November 22 and 24. Lecture VII.—Mechanism, "The Pleasures of Nonsense," November 29 and December 1. There is much originality in the subjects, and the titles have been selected with Mr. RUSKIN's customary aptness of phrase.

IF our readers wish to have a hearty laugh, they cannot do better than invest a shilling in a little book called "Trowel, Chisel, and Brush." The joke is that the thing is supposed to be "a comprehensive summary of the works of the Great Masters," and an aid to education in the Fine Arts. On every page there are amazing statements, which, on account of the seriousness of the author, are gems of humour. The Corinthian Column stood, we are informed, on "a square base, surmounted by carved rings;" the Doric was "five times higher than its diameter;" the Ionic Caryatides "were placed in front of the columns." In speaking of Indian architecture, it is said that the Taj Mahal is the most remarkable example of Mohammedan work. Decorated Gothic is supposed to be a "degenerated" form of "pure Gothic." Stained glass windows were introduced to produce "an imposing light and a musical rendering of the services of the Church." The Thames Embankment is united with the Houses of Parliament and the Royal Courts, as if it were a Gothic work. In other branches of art there is similar humour. Thus in painting we learn of a THOMAS STOCKARD, who was "a book illustrator, and produced several successful paintings." Sir AUGUSTUS CALCOTT "excelled in coast and rural scenery; his masterpiece was *Raffaello and the Fornarina*." TURNER also produced "highly valued classical and historical pictures." The worst of a book of this kind is that the fun will not be always recognised, and that ignorant people will imagine they are about to secure "a bird's-eye view of art."

THE Castle of Lochmaben is associated with events in the career of King ROBERT BRUCE, and is therefore one of the historic ruins of Scotland. The hereditary keeper and governor, Mr. HOPE JOHNSTONE, is desirous of preserving the ruins, and with this view about two years ago he proposed to have the inner fosse cleaned out. But a holder of the land demurs to the work on the ground that it would be a violation of his rights, as his tenants and those of his predecessors have pastured cattle during a very long period on the land to be disturbed, and on the land surrounding the castle. This claim is grounded on a clause in the conveyance, which excepts and reserves "the Castle of Lochmaben within the gates thereof." But the fosse would hardly come under the designation—and there is much probability that it is excluded. The inhabitants of the district are proud of the old castle, and they propose to memorialise the Crown in favour of its preservation.

DESIGN FOR THE ADMIRALTY AND WAR OFFICES.

THE design published this week is by Messrs. SPALDING & AULD, and it is the last of the series of selected designs which were considered in the second competition for the Government Offices.

## INTERNATIONAL EXHIBITIONS.

A PAPER on "International Exhibitions" was read lately by Mr. E. W. C. F. Schmidt, A.R.I.B.A., in connection with the exhibition at Eastbourne. The author began by referring to the part taken by his father in promoting the Great Exhibition of 1851. He first suggested that instead of a national affair only, it should be an exhibition from all parts of the world; it was then altered to "All Nations," and then to an "International Exhibition." France had such exhibitions as far back as the year 1820. It had been stated that the suggestion for an international exhibition in England emanated from Sir Henry Cole; but he (Mr. Schmidt) claimed it for his father, who in 1845 was engaged in working out the idea, and he had brought an account of the first stages of the work as recorded in the journals of the day, and begged to hand them round to the audience, as he wanted them to keep the facts in their mind's eye. He might remark that it brought his father into correspondence with all the principal artists and inventors of the day. It was then the law in France—in 1845—that all works had to pass the Chamber of Deputies, and they would find it recorded in an issue of the *Moniteur* of that date, that the late Mr. Schmidt's name was mentioned in connection with works produced by his father. The lecturer also produced the first circular issued by his father in connection with the Exhibition of 1851, and other documentary evidence to show that the late Mr. Schmidt had several interviews with the late Prince Consort, and that the suggestion to have an exhibition of the manufacture of arts of all nations emanated from his father. The Americans had claimed the invention of the sewing-machine, but the Royal Institution was the first place at which one was ever seen, and it was one upon which his father lectured at the Royal Institution, and also upon the first brick-making-machine. The late Prince Consort sent for him several times to Buckingham Palace. With regard to the influence of international exhibitions on trade and commerce, they were used for the introduction of new inventions and the interchange of ideas; commerce had been increased, and emulation had been fostered, because the medals and diplomas distributed had a commercial value, and many entered into keen competition. With regard to the Exhibition of 1851, it was said that it would be the commencement of the reign of peace, and people thought the Millennium would begin, but unfortunately it was not so, as there had been no less than ten wars since the time, and one was now going on; and the exhibition in Paris was actually held while war was going on.

## THE REFACING OF WESTMINSTER ABBEY.

THE following letter from the Secretary of the Society for the Protection of Ancient Buildings appears in the *Times* :—

I shall be obliged if, before it is too late, you will allow me to call the attention of the public, and of those specially conversant with the subject, to the contemplated refacing of the outside walls of Westminster Abbey.

According to a contemporary :—"The most extensive restoration that the exterior of Westminster Abbey has undergone during the long course of its history has now fairly commenced, and for several years to come workmen will be engaged in operations which, when completed, will literally have put a new face upon the greater portion of the Abbey. The work of erecting the scaffolding from the bottom to the top of the north transept is being rapidly accomplished, this being the first section of the Abbey with which it is intended to deal. After this part has been restored the work will be continued on the south side, and the east and west points will subsequently be taken in hand."

Another contemporary writes :—"At length it has been decided to make a thorough examination and restoration of the exterior of the Abbey, and with this object scaffoldings have been erected in some parts, preparatory to a detailed examination of the edifice, by Mr. Pearson, R.A., the architect of the Abbey. Until a careful survey of the edifice has been made it is impossible to prepare a scheme of restoration that will be followed throughout."

Now, Sir, there is one point upon which all must be agreed, namely, that it is of the most vital importance for the well-being of the Abbey that the right method should be adopted in any works which may be undertaken for its maintenance. The judgment of a living architect upon the work of Sir Christopher Wren in connection with the Abbey may well make that architect and others responsible for the contemplated renovation hesitate and ask,

What will be the judgment of posterity upon us if we do not ourselves pause in the moment of decision and reconsider?

In 1882, when the attention of the Society for the Protection of Ancient Buildings was first called to the proposal to reface the outside walls of the Abbey, a committee of the society, appointed to carefully examine and report upon the state of the fabric, reported that, in its opinion, repairs to the church generally, and particularly to the flying buttresses, were indeed much needed, as no one on seeing the state of the church could deny, and should certainly be undertaken at once in detail and with patient caution; but that any wholesale refacing similar to that which had been recently accomplished at the west end of the south clerestory would be fatal to what remained of the ancient masonry on the outside of the church, of which more remained than was generally known, and far from a wise treatment with regard to the stability of the fabric. The ancient masonry was doomed to disappear in time; but the action upon it of the weather and of London smoke was slow, gradual, and for the most part uniform, and it would be many years before this slow decay reached the substance of the walls. When it had so reached or nearly reached the substance of the walls, would be the time to effect the refacing; but to cut into and back through this facing now for the purpose of adding a solid new facing of stonework would be ruthlessly to anticipate the slow hand of Time, and in doing so to shake and impair the solidity of the structure as a whole. Moreover, the committee observed that where the walls had been already refaced, not only had the substance of the walling been shaken, but the new face had itself decayed, and the decay was advancing at a quicker rate than in the older portions of the building.

We cannot pretend to be acquainted with the plans which the guardians of the Abbey may have formed with respect to it, but if, as is publicly asserted, their plans do so comprise a wholesale refacing, then we beg of them, in view of the immense importance of their decision, to pause, though they have come to it, and once again, with the aid of other experienced opinion, to reconsider the matter. In the words of this year's annual report of the society, "In dealing with such a building as Westminster Abbey each original stone should be numbered and dealt with as a precious jewel." Once disturb one, and that mark of the hand of our forefathers, working in a spirit never to be matched now, has gone, and the mark is irrecoverable in all time to come. Time may, and ultimately will, deface all that man has done; but is that a reason why man should himself intervene and be his own destroyer before his time is ripe?

May the English people awake, and not allow the question of the maintenance of the ancient fabric of Westminster to be decided upon the opinion of one sole arbiter, who, however eminent, may in his turn, in time come to be thought to have been no wiser and not more prudent than Sir Christopher Wren.

## THE BERKSHIRE MEMORIAL.

A MEMORIAL is to be erected to the officers and men of the 66th (Berkshire) Regiment who were killed during the Afghan campaign of 1879-80. The commission was entrusted to Mr. George Simonds, the sculptor, and the work is now in a forward state. The life-sized model for the lion was completed at the close of last summer in the gardens of the Zoological Society. The clay model was then moulded in plaster and two casts were obtained, one of which was shown at the last exhibition of the Royal Academy—(No. 1776—*A Life-sized Sketch at the Zoo*). The other cast was cut into various pieces to suit the requirements of the moulders and foundries, and these pieces are now being enlarged to the colossal size required, previously to the process of casting in iron. The head, one hind leg, the tail, and the greater portion of the body are already reproduced on the colossal scale. As to the pedestal, that has in itself been a great labour, but it has been brought to a successful issue, and with the exception of one or two small pieces of ornament which are not quite finished, it is all stored away under the Reading Town Hall, until it is required for erection in the Forbury Gardens. The clay which was used for the terra-cotta blocks of which this pedestal is formed is the rich red clay from the pottery of Messrs. Wheeler Bros., at Coley, who gave Mr. Simonds every facility for the execution of the work, which was moulded in a workshop erected for that purpose at Coley, and fired in one of their kilns. The expense and labour attendant on this part of the work proved far greater than had been anticipated owing to the refractory nature of the clay, and the great amount of warpage in drying. These difficulties were, however, entirely overcome, and the blocks of terra-cotta are of a quality that leaves nothing to be desired, either as regards colour or durability.

Messrs. Clark & Moscrop, of Darlington, have been awarded the first premium and silver medal offered by the British Dairy Farmers' Association for the best plan of a model dairy farm steading. There were fourteen competitors.

## THE OLD INNS OF IPSWICH.\*

I NEED scarcely remind the present company of the important part that the ancient hostelrys have played in the history of our old towns, and I may say Ipswich is far from being an exception. The influence they formerly exercised on the life of the inhabitants must have been very great, while the actual well-being of the town may be said to have largely depended upon them. The position of Ipswich as an important maritime town, taking a front place in the trade of Mediæval times, and being a great centre for travellers, gave it an eminence and distinction shared by few towns of similar size, if indeed by any. The religious houses, with their different dependences, caused it to be the halting-place, if not the habitual resort, of a large number of people of almost every class, while as a great wool mart from which extensive exports were continually made, it brought together crowds of merchants and others. It follows as a matter of course that inns and taverns abounded at a very early period of the town's history. Social life, when Ipswich first sprung into being in Saxon days, was at a very low ebb, indeed about as unsociable a thing as it is possible to conceive. Added to the wretched accommodation that the poorer people were obliged to avail themselves of, the alehouse, with its irresistible attractions, greatly increased their sorrows, although apparently ministering to their necessities. In these early days, such houses were pretty numerous, and became the frequent resort of the people, and, too often, the scenes of such riot and disorder as to lead to regulations being enforced of a somewhat stringent character. Of course there is no positive evidence as to the number or character of the houses of this or a similar kind which at the time existed in Ipswich, but the foregoing evidence as to the high position held by the town at a subsequent period sufficiently warrant us in supposing that the number was by no means small, while in point of character it was probably neither better nor worse than the ordinary run of such houses.

At the outset it may be well to observe that there is a broad distinction between an inn and a tavern, although they have come to be regarded as well nigh synonymous terms. An inn is a very ancient institution, the history of which goes back to a very remote period, concerning which it is impossible to speak at all precisely. It is certain that there was a time when the inn did not exist. In the hospitable days of the heroic times, travels were never undertaken for commercial or other business considerations, and there was consequently no need of the inn. As its name implies, an inn is a house set apart for the accommodation of strangers, who for the time being find therein a home; but the tavern is really a place for the consumption, by the numbers who congregate there, of the wine and other intoxicating drinks sold by the taverner who keeps the house. The house was known to the ancients as the *oinothes*, or wine-shop; to us they continue to be known as ale-houses. Somehow or other the distinction has almost if not entirely ceased to be real, and both are now comprehended under the familiar and more generic term of public-house. Certainly houses of either class are more or less for the use and accommodation of the public; but when it is borne in mind that public-houses, as such, have, even from the very remote Roman period, had a sort of infamy attached to them (even to incurring certain disabilities) as well as to the persons who kept or frequented them, which is to some extent still the case, the larger term in its universal application is much to be regretted. But as in all else there have been frequent changes in public opinion, and the keepers of taverns have not unfrequently held positions of trust and importance in town affairs and stood high in the estimation of their neighbours. Although there are on record instances as early as the thirteenth century of taverners being returned to Parliament, it is more than probable that innkeepers have all along felt that the position was one of such peculiar difficulty as to cause them to abstain from seeking to occupy offices of dignity and authority. While the tavern has undergone but little change, it is quite otherwise with the inn. The monasteries were undoubtedly the chief inns of Mediæval Ipswich, and it was to one or other of these that travellers resorted for rest and refreshment while pursuing their journey. At an early period there were no lodgings in the usual sense of the word to be had, but both in the town and in the suburbs houses were to be met with in abundance which afforded temporary homes for such as would now be said to have no visible means of subsistence, as also for the huge class of itinerant musicians, jugglers, tumblers, ball-players, wrestlers, players, and other strolling entertainers who made frequent visits to the town.

Travellers of the better class would find no difficulty in securing a comfortable lodging with some one or other of the townsmen moving in his own condition of life, for which convenience the traveller would, on leaving the hospitable roof, render a recompense. An old poem, entitled "Floyre and Blunehfeur," published by the Early English Text Society, recounts the adventures of hero and heroine who, seeking each for the other, at length

To a riche city they bothe ycome,  
Whaire they have their inn ynome (*taken*).

\* From a paper by the Rev. C. H. Evelyn White, read at a meeting of the Suffolk Institute of Archæology.

And it proceeds to tell how at the house of

A burgess that was wel kind and curteis

first the one and then the other took up their abode, and in turn left, but Floris first receiving news of his beloved,

Took his leave and wende his way,  
And for his night's gesting

He gaf his host an hundred schillinge,

partly, it may be presumed from the amount, in gratitude for the welcome intelligence received in the inn. We have here an illustration that throws considerable light on the manners and customs of our forefathers, such as would frequently recur in former days in our own town. The far-famed shrine of Our Lady of Ipswich, which in Mediæval days did so much to make the name of Ipswich familiar, drew an immense concourse of pilgrims to the town who would need the accommodation afforded by the inn, and cause the number of the latter greatly to multiply. At stated times the number of pilgrims would be specially large, and make the finding of lodgings a rather difficult matter. Such persons on an errand of a similar nature would usually travel in companies and frequent the same inns, and continue throughout their sojourn in intercourse with each other. Erasmus, in his well-known colloquy, gives an account of a pilgrimage to the sister shrine in Norfolk, Our Lady of Walsingham, from whence a fragment of wood, said to be cut from a beam on which the Virgin Mother had been seen to rest, was obtained. The possessor of the relic being questioned as to whether he had made trial of the powers of the wood, replied, "I have; in an inn, before the end of three days, I found a man afflicted in mind for whom charms were then in preparation. This piece of wood was placed under his pillow, unknown to himself; he fell into a sleep equally deep and prolonged; in the morning he rose of whole mind." Chaucer's Canterbury Pilgrims sojourned at the sign of the Chequers, the host of the well-known Tabard, in Southwark, from which house they set out, acting as their leader.

We may from these instances gain some insight into an Ipswich inn and its surroundings under somewhat similar circumstances. But it was not until the middle of the fourteenth century that inns, at which travellers could obtain both food and lodging, were introduced into England, and not for some time after that were they to be met with except in the most important towns, of which Ipswich was certainly one. Previously men generally "used hospitality one to another without grudging"—indeed, it could be legally enforced; but then very few people travelled, and only upon most urgent occasions. The monasteries took the lead in entertaining strangers, setting apart for their special convenience what may suitably be termed "an inn within," otherwise known as the Hospitium or Great House, frequently a detached building. Here all things necessary for travellers were freely provided, and a monk, known as the hospitaller, attended to their wants. The parochial clergy, it must be added, according to their often scanty means, exercised hospitality with no niggard hand, not by any means confining their liberality to the rich and powerful. The foreign traders who came to Ipswich were subject to the most vigorous enactments, of a very arbitrary character, the result of a short-sighted policy, that generally hindered the growth of early commerce, and retarded the prosperity of the kingdom. One of these inconveniences—a slight one compared to many that were levelled against them—was the withholding from them the right of dwelling in their own houses, and living therein after their own manner. To meet the difficulty thus occasioned, resort was had to a class of men termed "hostmen," with whom the strangers lodged and boarded. Whether or no they were innkeepers in the strictest sense of the term I am unable to say. Their occupation was certainly not very dissimilar, but in addition they appear to have acted as brokers, although it was contrary to Henry's III.'s charter, which allowed no brokers, and were likewise required to take charge of their goods, and to transact business for them. Regulations for these hostmen are laid down in the Ipswich Domesday Book. The "Buttulerage Boke of Ippyswiche" contains the names of several Ipswich merchants who were charged with the customs of butlerage and priceage as importers, among other articles, of the wine of Gascony. It is obvious that the commodities of wine and beer were not only things of daily consumption, but that a large trade was likewise done.

From old pictures of Mediæval inns they seem fully to have kept pace in their architectural and such features with the prevailing styles. The courtyard was a necessary adjunct to a fully equipped inn, and generally there was an external staircase to the principal rooms on the first floor. No such ancient inn now exists in Ipswich, but side entrances communicating by a staircase from the courtyard with the upper apartments are, though far removed from their original condition, still to be seen. Of course the arrangements of a house varied greatly according to the locality and the requirements of those frequenting it. But as a general rule I believe I am correct in saying that the sleeping apartments, as also the dining and other such rooms, were shared in common by the visitors. Old engravings represent the beds placed side by side around the apartment, after the manner of a ship's cabin, offering probably less privacy and not fewer incon-

veniences. The furniture, &c., was of the simplest description and most limited extent, but probably sufficient for the requirements of an unrequiring age. The exterior was quaintness itself, as may be still seen, after a sort, in the old remains of domestic architecture, of which the town possesses still some fair examples—only we look upon the venerable gables and carved angle-posts with their many interesting details in a state more or less of decay, but once they were stately and grand in a congenial atmosphere. The hours that would otherwise have hung heavily were enlivened by song and story, and those who were accounted proficient in either art were, I suppose, in those days esteemed the people's best friends. It was at the inn that the farmer formerly met with purchasers for the corn, which he sold by sample. Here it was that the pedlar disposed of his wares, and generally the inn was used for similar purposes. Even on the introduction of the weekly market, which was obtained by a Royal Grant, the practice continued, and I suppose may be said still to exist, illustrating the well-known proverb, "Old customs die hard." Anyhow, the inn at almost every period of its history presented a picturesque scene of constant employment, with which we are not now very familiar, but our forefathers in Ipswich saw it under its most pleasant and interesting conditions.

At the early part of the sixteenth century, inns, taverns, and coffee-houses were to be met with in all parts of the town. Among the more famous hostelries were the King's Head, the George, the Griffin, the Assumption, the Tabard, the Turke, the Angel, the Dolphin, the White Horse, the Chequers, the White Lion, and the Crown. Of these the King's Head stood formerly in King Street, by the present Corn Hall. It had to the last a remnant of bygone days, in the spacious courtyard from which the coach started. In the thirteenth century the site, if not the actual house, was the "Sociary," to which the members of the Corpus Christi Guild retired for refreshment at the conclusion of the procession. The Griffin was a noted inn, and stood on the site of Messrs. Footman's premises, the Waterloo. Here it was, prior to the erection of the theatre, stage plays were acted (1736). A company under the patronage of the Duke of Grafton frequently performed here. The Chequers formerly stood where the Crown and Anchor now are. The sign is so ancient that it may be seen, it is said, on houses in exhumed Pompeii, in this character. Brand, in his popular antiquities, says that it represented the coat of arms of the Earls of Warrene and Surrey, who bore chequer or an azure, and in the reign of Edward IV. possessed the privilege of licensing ale-houses. But there is a far more likely explanation, which throws considerable light upon the usages of the Middle Ages. It was customary for merchants to use a counting-board, marked with squares, upon which counters were placed to facilitate arithmetical calculations. Such a board was used by money-changers to indicate their calling, and in process of time inn-keepers in certain cases, adding to their ordinary occupation, would use the sign. The centre of the town and neighbourhood of the market would account for the position of the house in Ipswich, and altered circumstances for the discontinuance of the sign. A house having a similar designation is still to be found in New Street, St. Clement's, in the neighbourhood of the Quay, which would be a favourable position for a house bearing the sign, but the house itself—a seventeenth-century structure—having an interesting exterior with carved gables, is a modern beer-house.

The Angel was a famous inn, situate on the Quay. It was a fine roomy old building, and said to have been a house of Cistercian monks, but I believe there is no foundation for this statement. It is now a malt-house. The Assumption is a remarkable sign for an inn. I am unable to say where it stood, or give any particulars. The White Lion formerly stood at the west end of the Mote Hall, where now is the Golden Lion—a dirty exterior was probably changed for a coat of gold. The White Horse has long held a principal position among the inns and taverns of Ipswich, and is known far and wide as a celebrated house. Long before Charles Dickens told of Mr. Pickwick's adventure in the house which had "elevated above the principal door a stone stature of some rampacious animal, with flowing mane, and tail distantly resembling an insane cart-horse," the house had a name. Several persons of note have stayed at the hotel, among whom may be numbered King George II. in 1736, and Lord Nelson in 1800. The aspect of the house is greatly changed from what it was in the early part of the present century, when it had its famous courtyard belonging to coaching days (coaches were advertised to start "if God permit"), while the front, which was of a somewhat unique appearance, extended some feet into the present street; but probably Mr. Pickwick's mistake has done more to raise the fame of the house than anything else. Early mention is also made of a house called the Three Cones. Gooding's Coffee House, which stood on the site now occupied by the chemist's shop at the corner of Northgate and Carr Streets, seems to have taken a high position as a house of entertainment. It was a curious old house, with much interesting carved work, notably a corner post, made familiar to us by the pencil of George Frost. Much of the ancient wood-work is reinstated in the Cliff Cottage and the adjoining house, belonging to Messrs. Cobbold. The military who were stationed here in such large numbers frequently had most sumptuous

dinners at the Coffee House, and it was much used for public and other meetings.

The Elephant and Castle, in the lower part of Silent Street, was a fine old Elizabethan mansion, which, previous to its conversion into an inn, was first the mansion of Lord Curzon, and was generally known as Lord Curzon's House, whose name, previous to its final destruction, was to be seen in the rebus on the old wood-work of a back gate in Silent Street. The house afterwards came into the possession of the Bishop of Norwich, it having been granted for his use in the reign of Edward VI. During the Dutch wars in the latter part of the seventeenth century, it was used as an hospital for those who suffered in the sea engagements, or from other sickness. The house was for some time afterwards used as a malt-kiln. Its best remembered feature was a stately porch built of red brick, which projected some way into the street, and beneath which vehicles used to pass. In 1517 Henry's queen Catherine of Arragon stayed in this house, and the king himself slept here when he visited Ipswich in 1522. A famous inn in former days was the Mitre Tavern, standing in Tavern Street, at the corner of Dial Lane (formerly Cook Row), where Mr. Hunt carried on a bookseller's business, and now occupied by some handsome shops erected by Messrs. Meadows & Bennett. It is on this site that the Subterranean Chapel, known as St. Mary Magdalene's, formerly stood. Beyond a groined roof and two Early English doorways, one of which probably communicated with St. Lawrence Church and the other with a vault further down Dial Lane, there were no other remains. Apparently a greater part of this underground structure had been utilised by the former holders of the Mitre; a number of broad-vaulted arches of massive brickwork, of some feet thick, were evidently put together with mortar such as would have been used two hundred years ago. A drawing of this chapel was made soon after its discovery in 1846, and is now to be seen among the Fitch collections at Bury. Its existence, however, was scarcely known until the recent excavations on the premises. In St. Lawrence Street formerly stood the White Hart, an inn of much renown. It was at the east end of the church, leading from Tavern Street to the Butter Market. It was a great posting-house, having a picturesque entrance gateway of an antique character, the spandrels of which were ornamented with the well-known dragon. Near the last-named house, adjoining the noted Ancient House of Sparrow's on the west, stands the Waggon and Horses, which under the same or a like designation—it was called the Waggon somewhere about 1567—has been an inn for upwards of three hundred years at the least. This leads me to observe that signs were formerly selected with a more real application to the immediate surroundings of the neighbourhood than seems to be the case now, and as far as I am able to discover all the old inns and taverns of Ipswich bear me out in this assertion. The Old Butter Market, or Fish Market, as this part seems anciently to have been termed, witnessed many a busy scene, the unloading of many a waggon with produce of every description.

## BUILDING IN STOCKHOLM.

MANY beautiful buildings have lately been erected, and the quarter of the town called Villastaden is rapidly growing and becoming the favourite residential quarter of Stockholm. Situated between the Humle Garden, one of the most beautiful parks in Europe, and the stretch of primæval forest that lies to the north of Stockholm, and with broad, handsome streets, it is not surprising that this part is attracting people from the older parts of the city. A short railway to run round the city, and terminating in a station in this quarter, will soon connect Villastaden with the central railway-station, and will give the public yet further advantages, in addition to the little steamers that ply over all the arms of Lake Mälär and the circular tram lines, in the way of locomotion. Building is very difficult and expensive. Some houses are erected on a foundation of piles, which are slowly driven in by means of a weight which has been lifted by manual force. Others are placed on ground which has been prepared by the blasting away of the primary rock which here forms the surface of the country. Wherever building is going on dynamite explosions are constantly heard, and the ear soon becomes familiar with the low, dull, rumbling sound. The workmen have complete control of this destructive agent, which heaves up masses of rock without hurling about small fragments in a dangerous way. The telephone is more employed in Stockholm than in London. Shop-keepers place it at the convenience of customers. All business houses employ the telephone freely. The hotels communicate with one another and with the houses of business.

Mr. John Heywood will shortly publish a new map of Greater Manchester, scale 6 inches to a mile, showing all roads, streets, houses, and other buildings in the parishes of Manchester, Eccles, and portions of Ashton-under-Lyne and Stockport, from surveys recently completed over an area of upwards of 150 square miles, containing 38 townships.

THE INTERNATIONAL HEALTH EXHIBITION.

WITH the exception of the list of awards, when they appear, we now present our readers with the last descriptive account of the exhibits that we intend publishing. Large as the exhibition is the exhibits that come strictly within our province to describe are not so many as may be supposed, and of those on view many are of a character that do not need remark. We are now within comparatively a few days of the time fixed for the close of the exhibition, and although the numbers of visitors during the past few weeks have shown a higher average than during the height of the season, it must be confessed that "a day at the Healtheries," apart from the unsettled weather, is not such a pleasurable "outing" as it was two or three months back. The owners, too, of some of the most interesting suites of apartments, find it necessary to partially close them, and to restrict the walk through to a mere passage by putting up ropes. In organising excursion trains from all parts of the country, at fares that it would scarcely appear could pay any one but the executive of the exhibition, the authorities have "tapped" almost the lowest strata of society, a class, too, of little or no use to the exhibitors. With fares at two shillings for any distance within 50 miles, and two shillings and sixpence for 100 miles, including, in many instances, the ride by the underground railways, as well as admission to the exhibition, the share of each corporation to these "handsome" sums of money must be very small, and the class of people who wander through the galleries with vacant stare and no fixed purpose, save to eat, drink, and smoke (where it is allowed), may be well imagined. When the total of visitors to the Healtheries is announced, it will doubtless be put forth as showing the interest all classes have taken in the display, but we may ask if it had been bereft of the music and illuminations what would have been the result?

Manufacturers and Millowners' Mutual Aid Association.

Among the independent buildings, one situated north-east of the south gallery contains exhibits of a very interesting and important character. It figures in the catalogue as Stand No. 1,081, and is occupied by the MANUFACTURERS AND MILLOWNERS' MUTUAL AID ASSOCIATION, and their object is to demonstrate by models and plans the process adopted by them for purifying rivers and streams that receive the refuse from various works, such as paper mills, glue and gelatine manufactories, &c. Samples of water before and after purification are shown, as well as certain valuable products recoverable therefrom. Owners and also operatives of such works would do well to make themselves acquainted with the remediable processes introduced by the Association, who also afford assistance for applying the same. They have offices at 5 The Sanctuary, Westminster, S.W., and are in a position to apply their remedies to samples of polluting matter, so that the probable cost and actual results may be ascertained before any expenses are incurred.

The Native Guano Company.

Adjoining the above, at Stand 1,082, THE NATIVE GUANO COMPANY have an exhibit of a somewhat similar nature. They more than the latter firm make the treatment and purification of sewage their special feature; and here are also to be seen models and plans illustrating what is known as the A B C system, for which, amongst others, they claim the following noteworthy advantages:—(1) That the effluent water is sufficiently purified to be admissible into any river within the requirements of the Rivers Pollution Prevention Act, and without injury to fish; (2) that it is effected without nuisance; (3) that no material is used which injures or destroys the valuable manurial qualities of the sewage, which are consequently preserved for agricultural use. The *modus operandi* is as follows:—The sewage is received into tanks, and in its progress through them undergoes its purification, the liquid portion running out directly into the river without requiring filtration or further treatment. As the sewage enters the works, the "A B C" mixture is added to it, which acts so definitely upon the dissolved as well as the suspended impurities, as instantly to precipitate them, allowing the purified water to run off to the nearest stream or river. The addition of the "A B C" mixture also has the very desirable effect of at once arresting all offensive odour, and this freedom from nuisance is certainly not the least of its advantages. The deposit or residue is pumped from the tanks periodically, when it is deprived by pressure of its superabundant moisture, and further dried by artificial heat till it obtains the consistency and appearance of dry earth. It is then ready for market as "Native Guano."

Messrs. Underhill & Co.

In the grounds at the back of the dairies, Messrs. UNDERHILL & Co., of Upper Thames Street, have erected a substantial one-floor building, in which they exhibit a good assortment of kitcheners, stoves, grates, &c., amongst which will be found some objects of interest. The white bricks used in this building were contributed by Messrs. Charles Hooper & Co., the Exbury Brick Works, near Southampton, and the red roofing tiles, ridges, and stringcourses by the Bracknell Brick and Tile Company, Bracknell, Berks, the building itself having been erected by Mr. W. Harper, Oxford

Street, Stepney. Messrs. Underhill have recently added the manufacture of marble mantelpieces to their already extensive business, and have opened extensive works at the Triangle, Mare Street, Hackney. They show several attractive and inexpensive samples of their work in this new addenda, well worth the attention of the architect and builder. There are two new tile grates, named the "Surprise" and the "Margravine," notable for their low price and genteel appearance. Another new one of semi-Abbotsford character has been named the "Desideratum," and will no doubt receive a good amount of patronage, as it is both artistic and economic, and a minimiser of smoke. The fire-basket, which reaches nearly to the ground, has an opening at the bottom through which the cold air enters, and, passing along to the back, rises, and is discharged through openings amongst the burning fuel in a heated form, promoting combustion, and consequently reducing smoke. But the greatest novelty in grates is undoubtedly the nursery grate, called the "Nightingale," and which only requires time for it to be known to meet with a large demand. This is grate and mantel in one piece, with an open fire (straight flat bars), with double doors above, which act as a blower when closed. Above this is an oven of good dimensions, opening with double doors, and flues carried around it in the ordinary manner. This oven will either bake well or keep anything warm according as the heat is distributed, and gas is laid on underneath for use when a fire is not required. A high-pressure boiler is also fixed at the back, sufficient to supply water to the bath-room, or other purposes. The whole is very compact, and a more perfect arrangement for a nursery it would be difficult to carry out. A good kitchener, called the "Lawrence" or "Health" range is also shown, the hygienic feature being the mode of ventilation adopted. This consists of an exhaust ventilator (Wintour's system) described below, somewhat of the shape of the letter T, which collects all the fumes generated in the ovens, and from the vessels on the hot plate, and, creating a suction, discharges them into the chimney. Fresh air is admitted to the ovens from the front, consequently there is good ventilation constantly kept up, as in a well-ventilated room. Wintour's mode of ventilation differs in certain of its phases from all others now before us, and is arranged both as inlet and outlet, and for all kinds of buildings. Fig. 1 (side view) shows the Universal ventilator for windows or walls, where access can be

Fig. 1.

Fig. 2.

Side View.

obtained to the inner atmospheres. It may be described as two truncated cones, made of finely-perforated metal, covered with glass on each face. One of these cones is inside and the other outside the room, and the atmospheric action being sideways, it is claimed that it acts both as an inlet and outlet, and that from whatever point the wind blows the current is broken up by passing through the small orifices of the perforations, and that the fresh air entering is, so to speak, filtered ere it enters the room, and that ventilation without draught is secured, and that the change of atmosphere, though constantly going on, is imperceptible to the occupants. These ventilators have been fixed in the office of the postal telegraph at Southampton, a room occupied by thirty-seven operators, and the following tables show the results as taken on three days in June last, and it may be added that at 9.30 p.m.

	June 23.			June 24.			June 25.		
	Inside.	Outside.	Out N.	Inside.	Outside.	Out N.	Inside.	Outside.	Out N.
9.30 A.M. ....	70	75	67	69½	69½	65	71	71	66

4 P.M. ....	75	79	73½	73	75	69	72	98	76
9.30 P.M. ....	—	—	—	73	70	67	70	69	65

from fifteen to twenty-five gas-lights were burning. The tables show that in most instances during the daytime the inner atmosphere was less than the outer, and that it was only after the gas was lighted that it exceeded it by a very few degrees, which is not likely to create surprise. We may admire this in summer, but we presume the inmates of a room would not desire to have the warmth so reduced in winter; and if the same deductions hold good in cold weather, means must be taken to warm the incoming air. But it is perhaps doubtful

if so close an approximation would be obtained, seeing that the gas would be burning so many more hours. Fig. 2 is an exhaust ventilator for chimney-shafts, to be fixed about one inch from the ceiling, and has also a finely perforated face. This is also particularly recommended for kitchens. Fig. 3 is an exhaust for the

Fig. 2.

Fig. 3.

Fig. 4.

ceilings of public rooms, &c. It has a gas-jet in the centre, and is connected by a shaft with fig. 5, which has a flap valve on either side of the mouth (this is of the same pattern as that mentioned for kitchens) to prevent back draughts, and fig. 4 has been constructed for hothouses, or to be used in connection with the outlet (fig. 5). Although the system is comparatively new, it has been fixed in many buildings, both public and private, and we understand satisfactory testimonials have been received. Economy in price is also claimed for it; and it is evidently a novelty in ventilation that is worth careful investigation.

#### Messrs. J. Watts & Co.

At Stand 474, Messrs. J. WATTS & CO., Broad Weir Works, Bristol, show a useful apparatus, the primary object of which is to apply the smoke-test to drains. We append a sketch of it, a

glance at which will at once testify to its simplicity. The ease with which it is manipulated, combined with the efficient manner in which it works and its extreme portability, have secured for it universal approbation. Various media may be used in it, such as tobacco paper, sulphur paper, &c., and for drain testing the fan is powerful enough to make the fume penetrate a great distance, while for disinfecting bedding and rooms it affords a safe and easy method.

#### Messrs. Capper, Son & Co.

The accompanying cut represents Pearson's patent "Twin Basin" closet, which is exhibited at Stand 540 by Messrs. CAPPER, SON & CO., Ingram Court, Fenchurch Street, E.C. It has now been before the public for some time, and is doubtless known to

most of our readers; but despite the many improvements that have been made in, and the new patents that have recently been taken out for this class of apparatus, the demand for the "Twin Basin" still keeps very active. The salient features of it have been pointed out on other occasions in the columns of *The Architect*, but we may mention that owing to the extreme simplicity of

construction, which the sketch makes quite apparent, and absence of complicated mechanism, the liability to get out of order is reduced to a minimum, while for cleanliness and protection against foul air from the sewer it will bear comparison with anything of its kind. The firm show a variety of other sanitary appliances, the most noteworthy being a folding lavatory, especially designed for use where space is of importance, as, for instance, on board ship, in railway carriages, libraries, &c.; Wentworth's floating water-heater, by means of which a warm bath may be readily and quickly obtained by merely placing it with a piece of flexible gas tube attached into the water until it is raised to the required temperature; and their pivot high-pressure water filter for fixing on to the nozzle of an ordinary tap, enabling the water to be drawn from the main as required for use, cool, fresh and pure.

#### Messrs. Brown & Green.

At Stand 631 Messrs. BROWN & GREEN, Limited, Luton, Beds, and Finsbury Pavement, E.C., are situated. This firm, it will be remembered, were awarded the gold medal at the Smoke Abatement Exhibition for their "Underfed" sitting-room grates and kitchen ranges, upon which occasion they were described in the columns of *The Architect*. They have recently entered the lists with a sitting-room grate on quite a different principle, and to this we now call attention. It is termed the "Finsbury," and illustrations are appended. It has the advantage of being capable of

alteration to a quick or slow-combustion grate at pleasure. The back is grated, and above is a solid fire-brick, the bottom also being formed of the same material. Situated a little space below the latter is a plate that forms with it a hot-air chamber. This chamber is so arranged that by drawing the plate slightly forward or pushing it backward it opens or closes communication at the back to the grated chamber before mentioned. This results in a slow-combustion fire, and by opening the chamber a flow of heated air is carried along to the back, where it is discharged through the gratings into and over the fire, and has the effect of minimising the production of smoke.

#### Mr. Schomburg.

In the Foreign Department, west central galleries, Mr. SCHOMBURG, 12 Buckingham Street, Strand, is showing an apparatus termed a "Soot and Spark Arrester," designed for the abatement of smoke, and constructed in accordance with experiments carried out by Dr. Werner Siemens, who has demonstrated that the sparks

and soot of fires can be separated from the smoke by mechanical means. From the above sketch it will be seen that in appearance it is somewhat like a chimney-cowl. The two cylinders *a*, *b*, placed one above the other, and some distance apart, are in diameter about the same as the chimney required to be fitted with it. Between the two cylinders an inverted cone *d* is placed, so that a circular space *e* intervenes the upper edge of *b* and the lower edge of the cylinder *a*, through which the smoke escapes. To this cone are attached four spiral blades *f*, which deflect the smoke rising up through cylinder *b*, and cause it to move in a

circular path round the cone. By this means the solid particles suspended in the smoke will be thrown by centrifugal action into the outer casing or chamber *c*, where they become deposited. For cleansing the apparatus, the cone is drawn up until it closes the lower end of the cylinder *a*, where it can be secured by means of a

chain and pin. The soot can then be removed by introducing a brush at the opening *g*, and collecting it in a receptacle placed to receive it at the knee-shaped tube *k*. A Woolport cowl, as depicted in the accompanying cut, may be fixed on the cylinder for preventing the entrance of rain, &c., and increasing the draught.

Mr. Robert E. Cox.

It is only by an occasional report, or information vouchsafed at a public meeting, that we hear of the progress that the Smoke Abatement Exhibition are making. But after all it is to private enterprise or that of our manufacturers to whom we must look for those improvements in domestic grates, calculated to arrest the evil. Until very recently the grates claiming to reduce smoke have been of too high a price for us to hope that they could ever come into general use. But a few days' since the writer was in conversation with a leading firm of stove-grate manufacturers, who are patentees of a speciality bearing on the question, and complaining of the high price, was met with this rejoinder, "When the public take a real interest in the question that will warrant us in manufacturing on a large scale, we shall be enabled to reduce prices; but with the comparative indifference now existing, we must be content to go on as we are." This opens up the idea that grates must be made that reduce smoke and that will do so automatically, and that can be sold at a price that will induce builders to fix them in place of those now used. We have, during our remarks on this exhibition, alluded to and illustrated a grate being exhibited of Mr. Thompson's, that goes far to meet the requirement, and we may now mention another of a somewhat different type, the invention of Mr. ROBERT E. COX, architect, 330 High Holborn, that as far as price goes is but a trifle in excess of that of the commonest register. Mr. Cox's patents combine two features, the making of a cheap grate, and the conversion of existing ones of any quality at the cost of a few shillings to his principle, without removal, and in either case the grate will burn coke much brighter and without sulphur fumes, anthracite coal, or bituminous coal. In burning the two former smoke is of course not generated at all, and in the latter the volume of smoke is considerably reduced. Our illustration will enable the principle to be easily understood. The grating of the fire basket is made solid,

with the exception of about three bars in the centre, and under the grating a solid plate *b*, covering a large part of the bottom, is slid in, about one inch below. The oxygen to promote combustion has consequently to pass in the direction of the arrows, between the sliding plate and the bottom of the grid, when it becomes heated, and enters the burning fuel through the narrow opening before mentioned, in a highly-heated state. As this takes place on each side of the fire the two currents virtually assist the circulation of the heat, and tend to keep up a

regular condition of combustion in the fire. Thus we have a hot blast working in the centre of the fire, which communicates itself to the fuel at the sides, subjecting it to great heat, and bringing the whole to a bright red. As there is no current of air at the sides, the heat from this part of the fire has less tendency to rush upwards, and it is mainly absorbed by the solid bottom and given off into the apartment, and at the same time a higher ratio of combustion is secured, producing, in the case of bituminous coal, less smoke. This combustion in the fire itself does away with the necessity of the usual wide opening in the register, which only requires to be slightly thrown back to allow the escape of exhausted air. We think Mr. Cox may be fairly complimented upon his invention, and he can claim to have introduced the cheapest grate, burning any kind of fuel economically, and with a reduction of smoke, as a 36-inch register can be sold to bear the usual trade profit at ten shillings and sixpence.

All Souls' Church, Harlesden.

SIR,—Your correspondent's notice of All Souls' Church, Harlesden, gives me the opportunity of pointing out that this building, in its present state, should be contemplated as a trunk without either head, arms, or legs, or even skin, for the bare bones of the octagon roof are not yet clothed with their intended ceiling.

Great praise is due to the vicar for having brought the work so far, while the local funds have been sapped by the building of two Wesleyan and one Presbyterian chapel. He is now endeavouring to complete the apse with its lofty walls and flanking stair turrets, a composition suggested by many Rhenish churches.

In the place of the nave and aisles, I have aimed at the finest effect that I can conceive a church to be capable of, namely, that of leading towards a vast space which seems to expand as one approaches nearer and nearer, revealing a processional *Te Deum* depicted around the walls, all those with whom the Church is in communion facing towards the altar enshrined in a lofty apse; while the choir, standing well forward amongst the congregation, lift their voices in concert with them and with the surrounding throng of angels, apostles, prophets, martyrs, and the rest of the Holy Church.

Your obedient servant,  
EDWARD J. TARVER.

The Decoration of the Dome of St. Paul's.

SIR,—Several weeks having now elapsed since the cartoons for the proposed decoration of the dome were fixed *in situ*, I venture, if you permit, to state very briefly my impressions of them, mainly in the hope that it may induce others more competent to record theirs. Doubtless the committee will be glad to hear opinions, as their present object is, probably, to ascertain what corrections of the cartoons are necessary. In this country artists have so little experience in this class of work that error at starting is quite pardonable. Having paid three visits to the Cathedral for the special purpose of considering them, I am sorry to say that my impressions are unfavourable. I think too much is being attempted upon the space at command, large though it is, and that the scale has not been fixed with sufficient regard to the point of view—the floor below; and I think the deficient light—reflected light only—has not been much considered. This is a case of optics, of science as well as art. It is not an occasion upon which there is no experience to guide us. There are the mosaics of the tribunes of the Roman churches, where large scale and simple treatment are striking and impressive characteristics; and the many Italian cupolas, within which such artists as Raphael, Guido, and Correggio laboured to fix a scale and treatment bold and simple enough for the special purpose. The wonderful foreshortenings of the last-named painter, at Parma, somewhat exaggerated though they were, created a school of admiring imitators. The dome of St. Peter's, in Rome, is treated in a manner more simple than is proposed for our St. Paul's, although it is nearly twice the size. There are no pictures with three or more figures, the experience of the artist having taught him that they are liable, if not certain, to become indistinct and confused at so great a distance from the spectator. On the contrary, the compartments at the great Vatican basilica are of very simple arrangement themselves, and are filled with simple figures of the Saviour, the Apostles, and angels in four zones. Thus simplicity, distinctness, and grandeur are the result.

The suggestion has been made that visitors to the cartoons at St. Paul's should ascend to the whispering gallery if they desire to see them properly. This is true, but of itself is sufficient to condemn the present designs, which are so small in scale that they cannot properly be distinguished from the floor below—the only proper point of view.

It would be a thousand pities for the time and labour of men of

such artistic power as Sir F. Leighton and Mr. Poynter to be all but wasted upon work intended to be executed in everlasting mosaic, but which will be almost invisible except from a troublesome and difficult standpoint. Under these circumstances, I venture very humbly to think that in our London dome the sham imitative architectural framework should be very much reduced and simplified, so that the size of the figures may be largely increased. If in these latter a more archaic treatment could be combined with academic skill, so much the better. And I am strongly inclined to think that this idea would harmonise better than the present proposal with the general simplicity of Wren's architecture—a consideration of very great importance. Apologising for speaking somewhat plainly upon a delicate and very difficult subject,

I am, yours faithfully,  
AN OLD ARTIST.

### WORKS IN PROGRESS.

**Some Extensive Alterations** have been going on for some months past in the greenhouses at The Holm, Regent's Park, London, one of the large houses in the Inner Circle. The vineries, plant, and storehouses, fernery, &c., have been rebuilt and entirely reconstructed on Messenger & Co's, of Loughborough, patent system of construction, which, broadly speaking, consists of a judicious combination of wood and iron, to give the greatest amount of rigidity, and to admit the largest possible amount of sun and light, a vital point in all greenhouse building, but more especially so in London, where smoke and fog have to be contended with. Every precaution has been taken in the glazing and general construction to afford as little harbour as possible for London soot in the roofs and fronts of the houses. A year or two before the present works were taken in hand, a house on a well-known dry glazing system was erected, but the result was not such as to warrant the remaining houses being reconstructed on the same principle, and after a careful comparison of the various and numerous systems of glazing in vogue, Messrs. Messenger's system was selected as best suited to greenhouse work, where it is so important to obtain a wind-tight as well as a water-tight roof. In this range of glasshouses, all the most recent improvements in the way of ventilating apparatus for opening the lights simultaneously; fittings, such as the beds and stages, which are of iron and slate, and perfectly imperishable, and heating apparatus with Messenger's patent elastic-jointed hot-water pipes have been introduced. The joint in Messenger's patent pipes is made by means of a flat elastic ring compressed between the socket of the pipe, and a loose iron ring which is bolted to the pipe, and possesses the advantage of being perfectly rigid when screwed up. We are informed it can be put together in a quarter of the time of the old-fashioned caulked joint, and must consequently be an economical method of fixing.

**The Church of St. Philip's, Birmingham**, to which a spacious chancel has recently been built in harmony with the original structure, has been fitted with handsomely-carved oak choir stalls, designed specially to suit the Classic architecture of the building. The whole of the work has been carried out, under the immediate supervision of the architect, by Messrs. Jones & Willis, of Birmingham, who also made the wrought-iron communion railings. This firm have also completed an elaborate pulpit in oak and iron for the same church.

**The American Elevator Co.**, 38 Old Jewry, E.C., have just completed the erection of one of their "Standard" hydraulic lifts in the Jervis Street Hospital, Dublin. The Council of the hospital have written to the company expressing their "complete satisfaction."

### CHURCH BUILDING AND RESTORATION.

**Hunslet.**—The church of St. Cuthbert was consecrated on Sunday. It is in the Early Pointed style, of fine red brick, with stone dressings and terra-cotta enrichments. The plan has been arranged to meet the contracted nature of the site, which is a short parallelogram. It consists of a nave, with clerestory, choir, sanctuary, and north and south aisles. The choir is raised four steps above the nave, and is enclosed by a low stone wall. The sanctuary is raised one step above the choir floor, and the footpace to the altar two steps above the sanctuary floor. The vestries are entered from the north aisle, at the east end of which is placed the organ chapel. The entrance porch is in the south aisle, entered from Kirkland Street, and is separated from the body of the church by glazed screens with swing doors. There are two external doors, both opening outwards. The seats and choir stalls are finished in a dark chocolate colour, and the roofs are of pitch pine unvarnished, with boarded ceilings, and covered with light green Westmoreland slating and red Staffordshire ornamental ridge cresting. The floors throughout are laid with marble mosaic concrete. The heating is by low-pressure hot-water apparatus, and the lighting by gas jets arranged along the clerestory. The pulpit is of Caen stone, with carved work of diaper pattern and angels supporting the book-rest. It is carried on a base of blue stone.

The font is a circular bowl of solid alabaster on a base and steps of blue stone, and is enriched with blue stone and alabaster shafts with moulded caps and bases. The church will seat 500 persons. The architects are Messrs. Perkin & Bulmer, of Leeds.

**Kidderminster.**—Memorial-stones, in connection with the rebuilding of the Old Meeting House, Kidderminster, have been laid. The plan of the building is a parallelogram, with an apse at the north and main entrance at the south, and it is proposed to have a tower and spire erected at the south-west angle, rising to a height of 140 feet. The style is Early Decorated Gothic, and the materials to be used are Alveley red stone for the facing, relieved with Bath stone, and internally with stock brickwork, relieved with Portland cement stucco. Mr. Tarring, of London, is the architect, and Mr. R. Thompson, of Kidderminster, the builder.

**Mercers' Chapel, London.**—This chapel having been closed for some months for repairs, was reopened for service on Sunday, October 5, a short opening service having been also held on the previous Friday. The chapel has been refloored and resealed throughout with carved oak stalls and seats, new choir-stalls, prayer-desk, and pulpit; the organ has been rebuilt and enlarged, and all the walls and the ceiling have been painted and richly decorated in gold and colours, and the sanctuary wall enriched with three frescoes by Mr. Newman, the large centre one being a representation of the Ascension, and the two side-panels respectively, the *Martyrdom of St. Thomas à Becket*, to whose memory the original chapel was dedicated twenty years after his martyrdom on the site of his birthplace; and the *Donation of the land to the Mercers' Company by his sister*. By the reseating the accommodation has been nearly doubled. The works have been carried out under the direction of Mr. J. K. Colling.

**St. John's Wood, London.**—The church of Our Lady, Grove Road, was the first Roman Catholic church built in London after the Emancipation Act, and one of the first Gothic churches of the revival, the contract drawings being dated October 1832. It was designed by the late J. J. Scoles, F.R.I.B.A. The church was reopened last Sunday, October 12, after a thorough repair. A new stone and alabaster altar has been erected, with a very rich reredos of novel design. It is of the entire width of the nave, and rising so as to form an architectural composition with the large triple lancet window. It is contrived so as to occupy the whole thickness of the wall, with pierced traceried openings to a staircase and passage behind for access to the throne used in the rite of Exposition. The floor of the sanctuary and chapels has been laid with parquet work. The whole of the works have been executed by Mr. Anstey, from the designs and under the superintendence of Mr. S. J. Nicholl, who was a pupil of Mr. Scoles.

### SCHOOL BUILDINGS.

**Warrington.**—Extensions have been carried out at the Grammar School. The work has been executed by Mr. Gibson, builder, from the plans of Mr. William Owen, architect, of Warrington. The sub-contractors were—Painting, Mr. Hedgecock; heating apparatus, Mr. Proctor Jones; stonework, Mr. Gittens.

**Hartlepool.**—The foundation-stone of a new Sunday-school, in connection with the Wesleyan chapel, has been laid in South Scarborough Street, and the new building will be practically an extension of the old school, which has been found inadequate for the requirements of the Musgrave Street body. The plans have been prepared by Mr. Dumpace, architect. The schools will accommodate about 450 children, 144 on the ground floor, and a little over 300 in an upper apartment, which will also be used as an assembly room.

**London Board Schools.**—There are now in London 367 Board Schools, accommodating 328,683 children. Of these, 289, accommodating 302,674, are now permanent schools built by the Board; 30, accommodating 15,297, have been transferred; and 48, accommodating 10,712, are temporary feeders to projected permanent schools. Of the permanent schools 14 have been added since the beginning of last October, accommodating 15,898 children, and additions to schools which were found inadequate have been made to the extent of 5,451, making a total of 21,349 school places added during the year. This is rather a low record. Nevertheless, the year has been one of great activity in the architect's department, for 37 contracts for new schools, and 17 for enlargements have been entered into. Twelve months ago the Board determined that additional accommodation was necessary for the proper discharge of business, and that the offices of the Board should be at once enlarged. The delay in carrying this into effect was due to the hesitation of the Board with regard to the question of the "Stores." When it was decided that this department could not with advantage be separated from the other offices, the work proceeded under the direction of Mr. Robson. The additional building, which covers about one-half of the site acquired some years ago, will be flush with the front of the present offices, and will fill the space between that and the new buildings erected by the Duke of Norfolk. It will be chiefly occupied by rooms for the staff, which is now about double in

number what it was when the original offices were built. One large committee room and some further general accommodation will be provided. It is expected to be ready for use in the course of next spring.

### NEW BUILDINGS.

**Glasgow.**—The new premises of the Glasgow Medical Missionary Society have been opened. The building is situated at the corner of Oxford and Buchan Streets. The accommodation provided consists of a hall, in which the meetings connected with the mission work will be conducted; adjoining the hall are the medical officer's consulting-room and the dispensary. A room is provided for visitors or lady workers, and there are also rooms for the caretaker. The premises are conveniently arranged and well adapted for these purposes. Special attention has been given to the heating, ventilation, and sanitary appliances. The walls of the hall and passages are lined with white enamelled bricks, and the floors are laid with narrow pitch pine boards and tiles. The hall has been tastefully decorated in quiet colours, and appropriate texts are inscribed in panels on the walls. The total cost will be about 2,000*l.*, besides 1,000*l.* for the site. Messrs. Campbell Douglas & Sellars are the architects.

**Hull.**—The Hull General Infirmary is about to be enlarged by the addition of two wings, and the erection of an out-patients' department. The architects are Messrs. H. Saxon Snell & Son, and the builders are Messrs. Jackson & Son, of Hull. The cost of the whole work will be about 25,000*l.*

**Mission Hall, Leeds.**—A Mission Hall was opened in Bismarck Street on the 11th inst., which has been erected from the design of Messrs. Adams & Kelly. The plan consists of large hall, 50 feet by 27 feet, with parochial room, 27 feet by 19 feet. Under the parochial room is a store-room, heating-chamber, &c. From the parochial room a staircase leads to the basement, which is fitted up as a kitchen, &c. The building is of red bricks, relieved with ornamental brickwork strings and labels, and is divided into bays, each bay being pierced with coupled lancet-headed windows. In the large gable is a four-light window. The gables have brick coping and moulded strings, and are surmounted with floriated stone crosses. The roofs are covered with dark Westmoreland slates, having bright red ridge roll. Internally the walls are plastered, and relieved with ornamental brick dado and bands. The windows internally have brick quoins, sills, arches, and label moulds, and are filled in with cathedral-tinted glass with dark-tinted border. Each window is fitted with hopper casement, so arranged as to admit air without draught. The roofs are open-timbered, having wrought principals with curved braces resting upon moulded corbels. Messrs. Longley were the builders.

**Newcastle-on-Tyne Infirmary.**—The foundation-stone of the new infirmary was laid on Monday. The buildings are to be Renaissance in style, the materials being red bricks and Dennich stone, with green slates to roof. The principal front is towards St. Mary's Place. The main entrance will be emphasised by an open porch with moulded columns supporting arches, above which is a projecting oriel window with balustrade parapet over. On either side the window, with mullions and transoms, are enriched stone pilasters with moulded caps and cornices, the whole surmounted by ashlar pediment and pedimented dormers connected by balustrade arcade. The main entrance will divide the ground floor into two parts, that to the east to be occupied as the administrative department, that to the west the out-patient department. The out-patients' entrance and exit are apart from the main entrance, and the apartments to which access is given are so arranged that the out-patients take up their position in order as they arrive, proceed to the consulting room (with special dark room off), and then to the dispensary waiting-room, passing through in the same order, and out of the exit door, without retracing any part of the route. On the upper floors the wards for in-patients will be provided. Projecting from the main buildings an operating-room and day-room are in connection. From the day-room access is given to an ambulatory for exercise, the roofs over some single-storey buildings being laid flat for the use of patients. Nurses' sitting and bedrooms will occupy the remainder of the buildings. The works have been designed and are being carried out under the superintendence of the architects, Messrs. Newcombe & Knowles, Pilgrim Street, Newcastle, the contractors being Messrs. T. & R. Lamb, Gateshead.

### GENERAL.

**Mr. J. D. Linton** has designed a diploma card for the Royal Institute of Painters in Water-Colours.

**An Exhibition** by the Rochdale Art Society has been opened in the public hall of the town. There are oil paintings, water-colours, and other drawings, which, with one exception, have been contributed by local amateurs.

**The Employers' Liability Act** has given rise to 443 actions in the County Courts during 1881, 1882, and 1883. The compensation claimed was 73,337*l.*, and about a fourth, or 18,124*l.*, was awarded.

**Dr. Bode**, of the Berlin Museum, states that he has discovered among the unnamed pictures in the gallery a genuine work by Leonardo da Vinci.

**Dr. Waldstein**, director of the new Cambridge museum of archæology, will give a course of evening lectures in the theatre of the museum during the present term, on Greek art. The lectures will be open to all students of archæology, whether members of the University or not.

**The Invitation Card** for the Lord Mayor's banquet at Guildhall this year is to be printed from an elaborately-worked border of cupids engraved on copper in the last century by Francesco Bartolozzi, R.A.

**Lieut.-Colonel Charles John Moysey, C.M.G., R.E.**, has been appointed Assistant-Director of Works for Barracks, in succession to Lieut.-Colonel William Salmond, R.E.

**The Newcastle Art Union** has allotted 264*l.* 10*s.* in prizes, which have been purchased from the Newcastle-upon-Tyne Fine Art Exhibition. A further sum was contributed by the prize-winners.

**Mr. W. Hay**, architect, has designed a memorial of the late Dr. William Chambers, which it is proposed to erect in St. Giles's Cathedral, at the cost of the Town Council. The memorial consists of a chapel, with a stained glass window.

**The Art and Industrial Exhibition**, at Newbury, has been financially successful, a balance of 100*l.* remaining after payment of expenses.

**Mr. C. M. Campbell** (of the head of the firm of Messrs. Minions), has had a dessert service painted by M. Leroy, which is to be presented to the Marquis of Stafford on his lordship's marriage.

**Mr. Sidney Colvin** will deliver on the 20th inst. the first of a course of lectures on Michel Angelo, at the Museum of Archæology, Cambridge.

**Mr. H. E. Jerningham, M.P.**, has commenced excavations at Norham Castle, for the purpose of discovering traces of the old foundations.

**The old Carmelite Monastery** at Queensferry is to be restored at the cost of Captain Dundas, of Inchgarvie, and presented to the town. It will be used as a public library and reading-room.

**A New Church** in Ayr, to cost about 4,000*l.*, and a new mansion house, at Doonside, near Burns's Monument, to cost 20,000*l.*, are to be proceeded with immediately.

**The Dundee Post Office** is to be enlarged at a cost of about 3,000*l.*

**Mr. George Campbell** has been appointed inspector of buildings at Tynemouth. There were 179 applications.

**A Plumbers' Congress**, under the presidency of the Master of the Plumbers' Company (Mr. George Shaw), will be held on Monday next at the Technical Institute, South Kensington.

**Forth Bridge Works.**—The first rivet was secured in the erection of the girders on the south side on Monday evening, under the superintendence of Messrs. McLelland & Son, Glasgow.

**The Duke of Westminster** has forwarded 500*l.* to the Chester Infirmary, being the amount of the shilling fees paid by about 10,000 visitors to Eaton Hall.

**Mr. S. J. Smith**, the inspector of the Local Government Board, has lately examined Windermere, in order to report upon the alleged pollution of the lake.

**A Building Trades Exhibition** will be held in the Coloured Cloth Hall, Leeds, from January 17 to February 2, 1885.

**Bishop Clifford** intends to deliver before the Bath Literary and Philosophical Association a lecture entitled, "An attempt to describe the Vicissitudes of the City of Bath by the aid of the old Roman Baths there extant."

**The Forestry Exhibition** in Edinburgh was closed on Saturday. From July 1 it has been visited by 500,000 people.

**The First Sod** of the works for the improvement of the river Ribble was cut on Saturday. The works comprise the diversion of the river, extension of dock works, &c., and eventually will cost a million sterling.

**The Parliament House** at Quebec was partly destroyed on Saturday by dynamite. The buildings form a hollow square, each wing being 300 feet long. Three wings were completed three years ago at the cost of 150,000*l.* They are used as Government offices. The fourth, which will form the Parliament House itself, was all completed except the roof. It is four storeys high, of cut stone, with iron girders. The explosion occurred in this wing.

**Glasgow Architectural Association.**—At the last monthly meeting a paper on "Linlithgow Palace" was read by Mr. Wm. Shanks, for the author, Mr. John C. T. Murray. The paper consisted of a description of the building and its surroundings, as now existing, and then a historical review of its numerous vicissitudes, with an account of the former buildings, which are replaced by the present beautiful palace. The subject was illustrated by several diagrams and photographs.

GRUNDY'S PATENT  
WARM-AIR  
VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent  
consist in the heating surface being greater than any  
other Fire-grate introduced to the public. It is very  
simple in construction, and is made in the form of a Stove,  
the back of which is semicircular in shape, with gills  
behind and smoke-nozzle on top, all cast in one piece.  
The same can be attached to any design of a Register or  
Stove front. It is very suitable for schools, class-rooms,  
waiting-rooms, hospitals, offices, dormitories, and dwelling-  
houses, from the cottage to the mansion. Design and  
specification post free on application.

TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"SIR,—I have much pleasure in testifying to the  
efficiency of your patent Warm-Air Fire Grate. It has  
been very successful, and given every satisfaction where I  
have used it.

"Yours, &c.

"JAMES WEIR, F.R.I.B.A.

"To Mr. Grundy."

"Baptist Chapel, Clapham Common, London. Richard  
Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the  
excellency and efficiency of your patent Fire-Grate. It is  
the most charming invention for heating a large room I  
have ever known. I shall have pleasure in showing it to  
anyone who wish to have their schools or rooms pleasantly  
and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,  
July 1884.

"DEAR SIR,—I have very great pleasure in stating that  
the first stove, or patent warm-air ventilating fire grate,  
adopted by me in school at Seaton, and a second in a  
Cocoa Palace, have given such satisfaction that I now  
order eleven to be inserted in New Upper Grade Schools in  
course of erection at West Hartlepool. They are the most  
economical, efficient, and easily managed stove at present  
before the public.

# The Architect.

## THE POSITION OF MUNICIPAL SURVEYORS.

HERE has been for the last few years a sort of running complaint kept up on behalf of the official surveyors of Town Councils, Vestries, and Local Boards of Health, by some of themselves as well as by friends of their cause, which by this time ought to have been brought into intelligible and tangible shape. At a somewhat demonstrative assembly of "the Association of Municipal and Sanitary Engineers and Surveyors" which was held recently under chairmanship no less dignified than that of Sir CHARLES DILKE,

President of the Local Government Board, the subject was brought up again. The question involved is one of importance to practical architects, and as such may well engage the attention of the architectural profession at large.

It is of such importance chiefly because of the obvious fact that, as "surveyors" of this class increase in number and advance in status, it is from the ranks of the unemployed architects that they must to some considerable extent be supplied. Not so many years ago but that comparatively young men can remember the time, it used to be the practice with the less responsible order of municipal bodies to look upon the appointment of a "surveyor" as a snug little piece of private patronage, which ought to be turned in the direction of any broken-down friend or colleague to whom the post would be welcome as a sort of sinecure. There is a saying that a clerk of works is "the eye of the architect;" and, on a similar principle, a knot of worthy boardsmen, taking their surveyor to be merely the eye of the board, would indeed be best satisfied with a personal friend who would look at the world through their own spectacles rather than expect them to look at it through his. Even yet, in spite of all the outcry that is being made throughout the country about the need for expert official control in matters of public health, safety, and convenience, it is well known that there are "surveyors" by the hundred, acting for all varieties of public authorities, whose training for their duties began at the date of their appointment, and who are self-taught men, therefore, in the most limited and least honourable meaning of the term.

But this state of things is now passing away, and we see a numerous profession coming into practice which professes to provide our public bodies with properly educated and experienced practical officers under the title of "surveyors"—amplified into that of "engineers" and sometimes "architects" when occasion requires—who shall be no longer the mere subordinate assistants of the governing boards, but their recognised responsible advisers and authoritative professional agents. It is quite natural that at first there should be a little friction in the working of such a scheme. It is not so much, perhaps, that the new experts will stand upon their rights, as that the old non-experts, in the character of their masters, employers, superiors, and so forth, will stand upon theirs. It may not even be that the surveyors will refuse in practice to give way to the boards, so much as that the boards will refuse on principle to give way to the surveyors. At any rate, we may take it that it is alleged to be a common occurrence for professional officials in the engineering and architectural business of the public to find themselves more or less embarrassed by the unintelligent and arbitrary decisions and orders of the representative bodies whom they "serve," and whom therefore they are expected to "obey" unless they wish to be turned out of office.

It is not easy to say which side will eventually conquer in this controversy; the end of it must rather be that each will in time come to understand the other better. The policy of all public business in England is that the ultimate authority must rest indisputably in the hands of public representative bodies, who shall determine all questions by a majority of votes. Amongst other things, all professional agency conducted on behalf of the public by experts, however recondite the work may be, must in one way or another take instructions from such entirely unprofessional

and inexpert tribunals. Every one of these, no matter how inferior its members may seem to be in the scale of intelligence, is loyally recognised by sensible persons as an embodiment of the common sense of the commonalty transacting its own affairs; and, as a fact, it is often a matter of surprise that the business is so well transacted as it is by such unpromising means. Grumbling on the part of officials, there must always be; but the outraged feelings of an inspector of nuisances ought to be soothed not a little when he remembers that generals in the field and admirals on the ocean grumble in precisely the same way for precisely the same causes, only that they are said occasionally to express themselves in much stronger language than surveyors are permitted to use. In that province of the public service, however, which we have in view, when the various appointments under the name of surveyors have in the nature of things come at length to be occupied by educated architects and engineers, we do not hesitate to suggest that the friction between them and their boards will grow less and less. Anything like an organised agitation on the part of public surveyors for the purpose of bringing municipal authorities, as they may think, to a reasonable recognition of professional ascendancy, would be not only mischievous because injudicious, but wholly futile because unnecessary. The object of organisation ought rather to be, on the contrary, the advancement of skill amongst the officials—in other words, the improvement of the professional ability of candidates—as the only real means of increasing their influence with the public and their representatives. The rule to rely upon is a very simple one: common sense is quick at discerning the difference between the reality of professional usefulness and the pretence of it.

At the same time it would be idle for us to dispute the fact that the professional officers of our minor public authorities have sometimes a hard time of it. Confining our attention to our proper subject, we will say plainly that a "surveyor" who happens to be either a little too weak or a little too strong may find himself—especially when he has the honour to be the subject of a lively debate in public, in which he cannot take his own part—almost as roughly handled as he can well be. It is perfectly marvellous what an amount of confidence and erudition a parochial orator from the back streets will display in the discussion of an engineering or architectural question, when fairly on his mettle in the presence of an audience of admirers whose business when they are at home is as primitive as his own. Building, even in its simple manifestations, we cannot point out too often, is a thing not "understood of the people." When such persons as Guardians of the Poor assume the responsibility of overruling the opinion of their medical officer, there is this at least to be said—that common sense knows something of medicine, if not much. When they contradict their solicitor, they are quite entitled to remind him that law professes to be the quintessence of common sense and makes use of twelve simple men in a box as the safeguard of justice. But when the control of building construction, or drainage, or road-making, or the like, is placed in the hands of a board of average tradesmen, there is much truth in the argument which so many surveyors offer, that the nature of such business imperatively requires the exercise of special deference towards a professional adviser. And yet the fact seems to be that this is the one class of public business in which the necessity for such deference is most notably unrecognised. The case of the Metropolitan Board of Works is a very remarkable instance of this. Before the year 1855 the great building authority in London was a Board of three architects, called the Official Referees, with a sort of recording angel, a lawyer, called their Registrar. On account of some pigheadedness amongst those gentlemen, which put the lawyer in permanent and contemptuous antagonism to the architects, their authority was bodily transferred to the Metropolitan Board of Works, who were provided with a single architectural official called by the sounding and suggestive title of "Superintending Architect of Metropolitan Buildings." The intention and expectation was that the chief of the former Official Referees, Professor HOSKING, should take this position, under the general supervision of the Board in the place of the former Registrar. But the result was that Professor HOSKING's candidature was promptly rejected; an unknown man, Mr. MARRABLE, was appointed, to be in reality the compensation valuer for new streets; and the business of the Official Referees was undertaken by a "Building Act Committee" of the Board. This was an assertion of the principle of the common sense of

the commonality *versus* the special skill of the expert with a vengeance; there is no doubt it was deliberately done; and from that day to this the Building Act business of the Metropolis has been virtually transacted by the representatives personally. It has been so transacted, we are bound to add, with much more success than could have been anticipated. Possibly this success may be due to the circumstance that the Board has always had several clever architects and builders amongst its members; but we quote the incident only as an illustration on the very highest ground of the readiness with which municipal authorities in general may still be expected to assume the command over their "surveyors."

After all, we commend to our official readers who may disapprove of such a course a very simple consolation. So much depends upon the individuality of the officer himself, that it may be said everything depends upon him. We hope to see the "surveyors" of this country becoming year by year more and more respected, not only by their superior authorities, but by the public. A good servant, it is said, makes a good master; but a good master likewise makes a good servant. A high sense of duty and a sound knowledge of one's business will always secure respect and deference when nothing else will.

### PALLADIO: THE MAN AND THE ARCHITECT.

TO the second edition of Signor CAMILLO BOITO's artistic studies on LEONARDO DA VINCI and MICHEL ANGELO a third has been added on ANDREA PALLADIO, which is in some respects still more worthy of attention. PALLADIO stands in most important respects, in contrast to the great geniuses with whom he is here associated, and he did not properly even belong to their age. He was only eleven years old when DA VINCI died; and if he was past middle age when BUONARROTI departed, it was only because the mighty Florentine outlived by so many years his noblest contemporaries and competitors.

DA VINCI and MICHEL ANGELO had this in common, that they regarded art as in its essence one, and professed and studied it as one, the primary germ of which painting, sculpture, architecture, and even poetry were incidental developments. But PALLADIO was strictly an architect; he did not, like the others, proceed from art in general to architecture in particular. From the very first he took his stand upon architecture, and formed a distinct conception of a special architectural problem, to which he devoted himself and prosecuted his studies with constant reference to its special suggestions and requirements. This was an age in which men of culture vied with each other so eagerly in the elegance with which they wrote Latin, that rather than fall into solecisms they restricted themselves to expressing only such thoughts as might have occurred to a Roman of the age of CICERO. PALLADIO was enamoured of the architectural language of antiquity, of which he studied the remains at Rome and elsewhere; but he applied himself to so manipulate these antique forms that while he preserved their charm he still made them subservient to modern purposes, expressive of modern meanings. It must be admitted that he achieved very considerable success. Palladian architecture will remain the collective title of what is truly a style of architecture. It has many varieties, and even yet has probably not seen its last development. Its characteristics are, in detail, the employment of the general elements of Roman architecture with considerable freedom of adaptation; regard for that quality of refinement in profiles and mouldings which is not absent, but by no means universally considered in Gothic architecture, and all under control of a presiding sense of symmetry, simplicity, and grace.

Signor BOITO adduces evidence to show that the birth year of ANDREA was not, as once believed, 1518, but 1508, the year which is indeed accepted in the recent Florentine edition of VASARI. He died at the age of seventy-two, in 1580, to the grief, says a contemporary, not only of his immediate friends, but of the entire city of Vicenza. VASARI, whom he outlived six years, mentions him with enthusiasm in the very last chapter of his work. At this date TITIAN, who was born before RAPHAEL, was still living at Venice, and—to no good effect—painting still. But it is with TINTORETTO (died 1594) and PAUL VERONESE (1535–1588) that PALLADIO really groups as a contemporary. At this date we are sensible of a glow, but it is the after-glow of the culmination of Italian art. Venice is grand, is luxurious, is even dignified, but the

essential nobleness which was at the heart of Florentine art and civilisation was wanting. Still, a period of material prosperity promoted an art in harmony with it. True, a century had elapsed since the voyage of VASCO DE GAMA had diverted much of the trade of her merchant princes, and the Republic had failed to check the aggressive Ottomites in the Levant; but skilful statesmanship had succeeded in gaining back, on the mainland of Italy, almost all that had been lost by the League of Cambray, and a period of uneventful annals succeeded—that sign of internal prosperity which accounts for the scope which heads of noble families, and wealthy municipalities, could allow to PALLADIO in building them palaces, and to TINTORETTO and PAUL VERONESE in decorating them.

Signor BOITO divides his essay into two sections: one on the personality of the architect, the other on the characteristics of his works. As regards the latter, who that in exploring one city after another in that "pleasant garden of fair Italy" that lies below the eastern spurs of the Alps, has not been struck by the special character which, above all, is given to Vicenza by the imposing and attractive works of its native architect? Failing of such an opportunity, or supplementary to it, we turn with zest to our "Fergusson," and have that peculiar pleasure of meeting with criticisms which strike a reader as so apposite that he can willingly flatter himself that it is due only to an accident that they did not occur to himself. But this is a large subject, and we turn at the present time to glean some interesting details respecting the man himself.

His father's name was PIETRO OF VICENZA, and that is all that is known, beyond certain presumptions that he had no claim whatever to gentle rank. He was indebted for early recognition of his talents, and apparently also for his expressive name PALLADIO, to TRISSINO, who is not undistinguished in the literature of the day. To TRISSINO he owed more than one opportunity of visiting Rome and making careful study of its antiquities; how far it was due to the same friend, how far to his own unaided energy, that he secured the advantages derivable from a liberal education, which he certainly possessed, does not appear. The portraits of him, are said to be questionable, as all dating long after his death; but this is no conclusive objection if they agree to a considerable extent, as they probably followed others that have perished. As described by a contemporary, he was rather short than of middle height, of handsome presence, and very cheerful habitual expression of countenance. His agreeable and lively conversation, it is added, was much appreciated by the men of rank with whom he was in communication, and, on the other hand, in his intercourse with his workmen he was familiar and affable. He took great pains with those of every trade to instruct them in processes of work and in familiarity with architectural terms, and had the art of obtaining zealous and cheerful service by his vivacity and friendly consideration. So VASARI, after giving a list of the works which he had already executed, concludes:—"I cannot but mention that with such excellence in his art is combined a disposition so agreeable and refined, as to render him the greatest favourite in every society."

This gaiety of nature is not salient in the tenor of his preserved correspondence, but we credit it all the same, just as our faith in BEN JONSON's testimony to "the free and open nature" of SHAKESPEARE is not shaken because, when a Stratford man did not pay for oats that he had bought, the poet took the law of him. This correspondence contains recognition in several instances, and in very cordial terms, of the merits of contemporary architects, and the implied cordiality was doubtless genuine. Still the tendencies of rivalry, and especially of rivalry in competitions, could not but be the same in the sixteenth century that they have been known to be in centuries succeeding.

It was as early as 1549 that the Council of Vicenza, by ninety-nine votes against seventeen, decided in favour of his model for their town hall, and so deserved the gratitude of all time. In 1577 the Doges' palace at Venice was seriously damaged by a fire, and PALLADIO was one among several architects who were consulted by the signiory as to the extent of the mischief and the best remedy. He was alone among four to give an opinion that the building was so unsafe as to require reconstruction. It does not quite appear how much of this necessity he put to the account of the fire, and how much to what he conceived to be original defective construction. What does peep out is that he was likely to be disposed to exaggerate both sources of weakness from the sense that, whether the

building was really secure or not, it did not appear so, which to his appreciation was almost as bad. He represented that the upper walls, pierced with only a few large windows, were too heavy for the open loggia and the colonnade or portico below it—so much too heavy that sooner or later it would certainly crush them: an undoubted mistake, for there they happily stand to this day. The parallels which he cited from the works of nature have more pertinence to the sentiment than to the fact of stability. The members of a tree, he pointed out, increase in delicacy by exact gradation upwards, from trunk to bough and thence to topmost twig. The awkward analogy of the human figure he got over by urging that a man erect and resting equally on both legs has but a precarious stability to oppose to a sudden impact. Every work of the ancients, from the Pantheon to the Pyramids, confirmed the principle. He did not propose to alter the entire elevation. He would have closed the open gallery, and introduced very solid piers or pilasters below, and so, while he remedied the assumed insecurity, get rid of the offensive appearance of top-heaviness and the incongruous relation of the upper and lower divisions. This scheme of modification was not the only one or the most extreme. One architect would have cased the building with superposed Ionic and Corinthian orders; another denounced it as a hopeless deformity and utterly barbarous, and, concurring with the general criticism of PALLADIO, would have razed it to the foundations to make way for a building "of such beauty as to be indeed worthy of so renowned and excellent a Republic." Between those who would raze it entirely and ANTONIO DAL PONTE, who had his way in restoring it without change, PALLADIO was left alone in reporting it as unsafe. None can regret that DAL PONTE prevailed, and that so was preserved to us the Palace of the Doges of the earlier centuries of the Republic. At the same time we must recognise the fact that it is not exactly as architecture that it tells so effectively. It is an object that painters have never been tired of transferring to canvas; it is not a design that any architect has ever thought of copying, or even of reproducing with modifications. Contrast with the more regular buildings around, imposing magnitude with simplicity of parts, the leading proportions of the mass, its colour, and then its historic associations, all combine to heighten its picturesqueness. But picturesqueness is not the first merit of architecture, or Tintern and Melrose would surpass Lincoln and Salisbury.

Strange to say, PALLADIO went far to confute his criticisms of the Doges' palace, as stated without qualification by his own work. It is impossible to stand before his Chiericati palace, now the museum of Vicenza, and not be impressed by a sense of imposing magnificence, combined with that pleasing harmony which is all the more pleasing because the secret of the charm does not betray itself: yet its characteristics range with those of the Doges' palace; we are looking at a free portico, which supports an open loggia with closed and heavier members of composition above all.

His report on the Venetian palace was written with some warmth. He could not have been the artist he was if his enthusiasm might not sometimes be so ruffled that even his temper betrayed irritability. It is much, indeed, if, with his passionate predilection for Classic forms, he could sometimes bring himself to speak indulgently of Gothic architecture. But politeness, like patience, has its limits. The limits of both were reached for PALLADIO in a discussion of projects for completing the yet uncompleted façade of the vast Gothic church of San Petronio at Bologna. He had as little doubt as to the propriety of adopting the Classic style as his admirer INIGO JONES entertained about adding a Corinthian portico to the Gothic cathedral of St. Paul's, at London. When we consider how triumphant was his success in clothing the Gothic Basilica of Vicenza with noble arcades of Classic detail, it is easy to understand his disappointment at losing the chance of another achievement upon so considerable a scale. He was opposed and foiled on the double ground of the incongruousness of such an association of opposites, and then of the great expense of the marble which he required for his comprehensive design. He did not dissemble his scorn of both objections; those, he said, who insisted on the miserable matter of cost were only exhibiting a spirit conformable to the genius of that ignoble German (that is Gothic) architecture of theirs. Considering how pervading was the worship of Classical antiquity at this time in Italy, what is most remarkable, perhaps, in these debates about San Petronio and the Doges' palace is that there

should have been found a remnant who thought incongruousness too great a price to pay for even columns and entablatures, and were strong enough to hold their ground in favour of the denounced barbaric buildings on the strength of, at least, their self-consistency.

The great merit of PALLADIO himself was that while earnest for the revival of ancient forms and their adaptations to the social conditions of his time, he was firm to a certain standard of purity, and never gave in to the alluring extravagances which MICHEL ANGELO might aspire to make majestic, but which with meaner minds became fantastic and frivolous. Even the names which he gave his children—LEONIDA, ORAZIO, ZENOBIA—are characteristic of the spirit of his art and of his epoch. But there is nothing of what has been stigmatised as the paganism of this epoch, in the records of his life or in his writings. The architect of the Redentore and other churches at Venice expresses in surely no inappropriate tone his sense "that the best ability of the architect is bound to be exercised upon the edifices in which the Maker and Giver of all things is worshipped and thanked for His so great benefits done to us. And truly, when we contemplate this beautiful structure, the world; when we consider how replete it is with marvellous beauty and embellishment, we cannot hesitate as to our duty in the little temples which have to reflect the semblance of that most vast, to so design them that they shall convey to beholders a sentiment of graceful sweetness and harmony: base and shameful it were if we who are in the light should be surpassed by those who lived in the times which were destitute of saving truth."

On the whole, no doubt, PALLADIO had reason for the thankfulness, which he is not slow to express, for opportunities to give actual embodiment to the results of inventive study; but we have seen that he was not successful in all his competitions, and even success was tempered in many instances by those familiar after-troubles of enforced changes and mutilations of a design by the whims or the necessities of employers. Of one business at Venice, about a theatre, he writes to Count VINCENZO ARNALDI:—"I have come to an end with the construction of that blessed theatre in connection with which I have done penance enough for all the sins I ever committed or ever shall."

It is PALLADIO, the man, with whom we have been at present concerned, and not with his architecture; otherwise it were hard to stay the pen without some words devoted to the Basilica of Vicenza, to what FERGUSON justly calls "the happiest adaptation of Classical art to modern purposes which has yet been executed in Europe."

The Olympic theatre at Vicenza was his last work. It is the oldest permanent theatre in Europe, but, indeed, chiefly interesting as a curiosity. The scene is designed after VITRUVIUS; it exhibits three portals opening to divergent architectural vistas in continuation of the proscenium. As we look at these by daylight from the auditorium the illusion of reality is marvellous; but the illusion is amusingly irrecoverable if a visitor returns to his first station there after a close inspection of the contrivances by which columns, flattened and built up in perspective diminution, are ingeniously made to conduct the eye insensibly to the colonnades of the proper painted scene.

## ART NOTES.

THE plate which Mr. R. W. MACBETH, A.R.A., has etched after *The Harbour of Refuge*, by the late FREDERICK WALKER, A.R.A., is on view at Messrs. AGNEW'S gallery, together with the original oil picture. It will be remembered that WALKER painted the subject in water-colours in the first instance, and Mr. MACBETH has worked chiefly from this drawing, which afforded points of difference, such as high lights in the chapel and almshouse windows, and other points useful for effect in the interpretation by line and chiaro-oscuro. It was somewhat bold to attempt at all the translation of a picture in which there is no positive light and shade—only the tremulous warmth of the after-glow—and which depends for effect much upon the contrast of a long stretch of red roofage with the green-turfed enclosure of the almshouse quadrangle, and yet more upon the apposition of varied high lights in the daisies on the lawn, the milky blossoms of the thorn-tree, the white shirt of the much-criticised mower, and the pale stone of the founder's monument. The painter can vary the hue of

his whites; the etcher can only vary the quantity and quality. It is no wonder that Mr. MACBETH made the stipulation that an interpretation, not a literal translation into black and white, should be expected of him. The sky, which is skilfully graduated, he has darkened to throw out the white-tufted head of the thorn; the tone of the whole plate is darker and heavier—if not positively, yet in effect—than the oil picture, the subdued luminosity of which is so beautiful. On the whole, however, Mr. MACBETH must be congratulated. His manner is somewhat aggressive, his execution apt to be ragged and scratchy, and this plate shows both faults; but there have been great difficulties to surmount, and the interpretation is, on the whole, sympathetic with the restful sentiment of the picture.

A fresh series of special exhibitions at the Fine Art Society's gallery opens with a show of nearly three hundred water-colour sketches by Mr. ERNEST GEORGE. That a practical architect should have found time to produce such a quantity of beautiful drawings appears amazing, and the collection is a testimony to Mr. GEORGE's power and industry; and his quick sense and selection of the picturesque have enabled him to seize upon characteristic features in old Dutch or German towns, French châteaux and churches, streets and monuments of Italian cities, Spanish cathedrals and gates, Scottish "wynds," Swiss lakeside or mountain villages, all with equal enthusiasm and care. But the collection deserves a special notice.

At Messrs. DOWDESWELL's may be seen some hundred small water-colour drawings by Mr. CHARLES ROBERTSON, of the miniature-album sort, which are favoured in this gallery; also a gathering of oil sketches and studies by Mr. GRANT PARTON, whose portraiture of silver birch trees gained him selection by the trustees of the Chantry bequest some years ago, and has since, by its persistence, brought on him certain accusations of monotony. Birch trees are frequent in these sketches, but also trees of various foliage, tumbling streams, too, as well as woodland pools. Mr. PARTON shows, in these outdoor studies, a breadth of manner, firm outline, and richness of palette in common with Mr. ALFRED PARSONS' landscape; it is honest, good work, if of no exalted range, and perhaps a little flat and thin in execution.

### THE "INCOHERENT ARTISTS" EXHIBITION.

THE second exhibition of "les Artistes Incohérents" was opened in the Galerie Vivienne, Paris, on Saturday last, and it will continue until November 20. The invitation card was a skit on the more imposing exhibition of decorative arts in the Palais de l'Industrie. The correspondent of the *Telegraph* says that this year the humour is heavy and grotesque, and the whole exhibition is strongly suggestive of the Morgue. Thus, on the entrance floor of the so-called Salon where the exhibition is held the first thing that strikes the eye is a ghastly and realistic picture of a man dead from hunger. Around are hung fragments of tattered garments, described as "Studies in Pantaloon," or jackets, as the case may be. Over the stairs is a large canvas, on which M. de Lesseps and his children are shown, the polls only of the latter being visible. Sarah Bernhardt is not forgotten; the famous actress appears in various positions; while Theresa, the popular *diva* of the *cafés concerts*, is mimicked by a monstrous and ugly head which hangs suspended from the ceiling of the upper floor. There are a good many pictures of human beings without heads, culminating in one of St.-Denis, who is in the act of shaving that appendage preparatory to escaping with it tucked under his arm, according to the legend. M. Puvis de Chavanne's great picture of *The Wood Dear to the Arts and Muses*, which was exhibited at the Salon, is satirised by an empty panel, to which several pieces of burnt wood are attached. Henri Rochefort is exhibited by Alfred le Petit, who also caricatures M. Hyacinthe, of the Palais Royal Theatre. Coran d'Aché, whose military sketches in the *Vie Militaire* are well known, sends a humorous drawing of Napoleon I. haranguing the 47th Regiment on the eve of Marengo. The great captain's back only is visible, while the colonel of the 47th is bathed in tears, and answers "Yes, sire," to the apostrophic "soldats" with which Napoleon invariably commenced his battle-field speeches. The same picture is again represented under the effects of the snow, Napoleon, the lachrymose colonel, and the troops being dashed with white. A morbid and indelicate picture of Hamlet flying from the dead body of Ophelia disgraces the exhibition, while there are one or two paintings which are really effective. One is intended as a scene from the new ballet at the Eden Theatre. A nymph is represented seated on a rock, while behind her stands her lover, who maintains a half-bandit, half-troubadour attitude. The nymph is brought out into relief by a jet of limelight, the whole being characterised as

"obscurantism cleared by the influence of light." M. Georges Lorin's *Comet* is also a pretty picture. A female figure floats through the air, leaving in her wake a line of light, splendidly coloured. Besides the pictures, a number of grotesque objects are ranged around, which excite curiosity and provoke a smile. There are books with blank leaves, wonderful umbrellas, lumps of baked earth labelled as terra-cotta, and a dozen other humorous combinations, suggested or *en evidence*. Altogether the exhibition, which is redolent of the seamy side of Parisian art life, is curious, amusing, and characteristically French. The exhibition of the "Arts Incohérents" has now entered on its second year, and may probably assume larger dimensions and greater variety in the future.

### MR. RUSKIN'S LECTURES.

THE first of Mr. Ruskin's series of lectures on "The Pleasures of England," as a sequel to those on "The Art of England," was delivered on Saturday in Oxford. The subject of his lecture, which was delivered before a large audience, was "The Pleasures of Learning," from the times of Bertha to Osburga. The Professor said that in the short review of the present state of English art given to the students last year he left, necessarily, many points untouched and others unexplained. The seventh lecture, which he did not think it necessary to read aloud, furnished them with some corrective statements, of which, whether spoken or not, it was extremely desirable that they should estimate the balancing weight. Those he proposed in the present course further to illustrate, and he hoped to open up to them the prospect of such a future of England as even the moral philosophy at this moment current had never perceived—such a future as they might both cordially and hopefully labour for, and those of them who were spared for the ordinary term of human life might even see with their own eyes, when all this tumult of vain avarice and pleasure shall have passed into its appointed perdition. The pleasure of learning, in the sense of receiving instruction, was a pleasure totally separate from that of finding out things for oneself, and was an extremely sweet and sacred pleasure when one knew how to seek it and to receive it. He propounded the question what our people would have made of themselves, and what sort of being the Saxon, the Celt, the Frank, and the Dane might have been at this time, untouched by the influences of other nations. He asked them to think of it, and to think chiefly what form the ideas and images of our national religion might have probably taken if no Roman missionary had ever passed his life in charity and no English king in pilgrimage. Of the impetus it was possible for any barbarous nation to receive during the first five centuries, either from the spiritual power of Christianity itself or the instruction in Classic art and science which accompanied it, one could not readily judge without taking the pains—and they would not, he thought, be irksome—of noticing carefully and fixing permanently in their minds the separate characteristics of the greater graces both in those who learned and in those who taught. Quoting from a lecture by the late Dean of Canterbury, in 1854, on the subject of the landing of Augustine, Mr. Ruskin, amid laughter, described the passage quoted as a Gregorian chant in praise of the British Constitution, to which he would take a few historical objections. Criticising the passages in question, he remarked that the Christianisation of Germany was by no means owing to English missionaries; our mission in regard to America, in practice, consisted chiefly, he believed, of stealing land and the extermination of its inhabitants by intoxicants; our rule in India had introduced there Paisley shawls instead of Cashmere; and he believed that the principal prospect from St. Martin's Hill, Canterbury, would not be thought by even the most cheerful of his audience to be one of the most inspiring in the world, for recent progress had entirely accommodated the architecture of the scene to the convenience of the present instincts of English civilisation, and the cathedral, the monastery, and the history in the tomb of Bertha reposed in base subservience under the colossal walls of the all-invincible county gaol.

### INFLUENCES OF ENGLISH SCHOOLS OF ART ON MANUFACTURES.\*

IF we regard the schools of art under their original designation as essentially schools of design, it cannot be doubted that they have had a most useful past; and, in anticipation of a still more useful future, attention may be drawn to the large proportion of schools to be found in towns where design is of the first importance to the success of the local manufactures. Moreover, information as to the employment of ex-students as designers has been sought at the various schools, and although in several cases they were stated to be so numerous that a list of names could not be attempted, and in almost all the record was dependent on the imperfect recollection of the master, extending sometimes over a very limited period, lists of names have been received showing that

\* From Mr. Sparkes's Exhibition Handbook.

many hundreds of men and women trained in the schools are at this moment engaged in the work of designing, not only in England, but also in France, Russia, Spain, America, Australia, New Zealand, India, the Cape of Good Hope, &c., and at home they have in many places superseded foreign designers.\* At Sheffield, for example, a dozen French designers and artist chasers were in 1852 the chief authorities on design and taste, and their work was mostly of a depraved Louis Quatorze character. The manufacturers being indifferent to art, the designers were absolute in their control, and the public, beguiled by richness of treatment, made no objection to the style then in vogue. Ten years later these foreign modellers and designers had been supplanted by Englishmen, and this change was greatly due to the influence and genius of the late Alfred Stevens. Having gone as a boy to Italy, Stevens spent thirty years there, and on his return to England obtained employment as one of the masters at Somerset House. On the reorganisation of the school he found it necessary to seek employment, and a Sheffield manufacturer had the wisdom to secure him as his chief artist, on the recommendation of Mr. Young Mitchell, the head-master of the local school of design. Mitchell and Stevens became fast friends, and the latter thus exercised an indirect influence over the school, for the accommodation of which a new building was erected at great cost. The School Committee was originally composed of *dilettanti*, the manufacturers being conspicuous by their absence; but now the latter take their full share in the government of the school. There is not a single French designer in the town, only two French chasers, and the leading manufacturers (especially those who produce the most artistic works) and general public are greatly interested in the school, many past students of which are occupying honourable positions elsewhere. In Nottingham, twenty years ago, the lace designs, most of which were produced by foreigners, were as a rule lamentably deficient in artistic taste, although there were some good ones amongst them. Sprawling palm-trees, nondescript flowers, and absurd ornaments, were huddled together in ugly confusion, and any attempt to leave the beaten track was regarded with disfavour, except by the Science and Art Department, which afforded great encouragement by its favourable recognition of good work. A school of design was established in Nottingham in 1843, but very little attention was given to the staple manufacture till 1866, when the school secured the services of a master who established special classes for the study and practice of design. After a time he conceived the idea of basing his pupils' work on good specimens of old hand-made lace, English and foreign, which were modified to suit the capabilities of the machine, and this in its turn was improved so as to be capable of producing larger designs for curtains, &c., without "repeats." The students were encouraged by money prizes to do their best, and from that period may be dated the extraordinary progress made in the Nottingham lace trade. It was soon found that native talent was quite equal to all the requirements of this beautiful manufacture; periodical competitions in design were stimulated by local prizes; English designers gradually superseded foreign artists; and in 1878 the undoubted merits of their work received recognition in the French capital itself, in the shape of a "diploma of honour" from the Paris Exhibition. One of the leading manufacturers of Nottingham, a warm supporter of the school of art, states that, whereas only ten years ago he paid from 1,000*l.* to 1,200*l.* a year for French designs and to French designers, his present expenditure in that direction is not more than 50*l.* Probably 1,500 young men are now engaged in that town as designers and draughtsmen, with such success that in Calais, the chief seat of the French lace trade, the manufacturers last year petitioned the Government to assist them in establishing a school of art there, lest they should be left behind in the competitive race. Many of the Nottingham manufacturers compel their apprentices, by a clause in the indentures, to attend the school of art three times a week—a course which is more or less adopted in Aberdeen, Bath, Barrow-in-Furness, Hanley, Preston, and other places; indeed, the school is one of the most popular institutions in the town, and has, moreover, an invaluable adjunct in the museum established in Nottingham Castle. One firm alone pays as much as 5,000*l.* a year to seventy designers, including apprentices; and though many designs are still sent over from Paris, they are always put into the hands of English draughtsmen before being put on to the machine. At Macclesfield, where the silk manufacture is the staple industry, the business of hawking French designs is gradually dying out, and only the other day a dealer in these commodities offered one of the students of the School of Art regular employment in sketching and designing, besides which it is well known that a large percentage of the "new French patterns" which arrive quarterly from Paris are really the production of English looms. The Macclesfield school is indeed found to be indispensable to the manufacturers of the town, amongst whom may be found seven or eight ex-students; and the designers

trained therein work also for the cotton, linen, silk, and woollen textiles of other towns. Designs are wanted for almost everything that Macclesfield produces, and it is found here, as elsewhere, that the school course provides higher standards of excellence than are demanded by the customers for whom the manufacturers have to provide. The ability of the students is, however, utilised as fast as they can be trained, and it is expected that the demand will be further stimulated when a technical school is also established, and gives instruction side by side with its artistic neighbour. At Belfast the artisan classes are most numerous attended, and the trades of the town, including linen damask weaving, cotton printing, embroidery, ironwork (wrought and cast), lithography, and engraving, have all been directly benefited; most of the designers have been trained therein, several having also had the advantage of a course of study at South Kensington; and the students include a large number of persons employed in the establishment of Messrs. Marcus Ward & Co. It is, however, regretted that the staple production of the town (linen damask) has not been more largely affected by the work of the school, for though the patterns show a marked improvement, many of them are still execrably bad. A local museum of art objects, and especially of textile fabrics, is greatly needed, for the place is singularly devoid of artistic objects and influences, and as the Free Libraries Act has recently been adopted by the town, it is hoped that steps will soon be taken to establish such an institution. At Birmingham great strides have been made in art-manufactures during the last thirty years, public taste has been largely developed, and designers and art workmen trained in the school of art are now generally employed. Here, owing to the nature of the trades carried on, there is a great demand for good handicraftsmen, and one of the principal firms, which formerly employed many foreign designers, modellers, chasers, &c., now relies almost exclusively on native ability. At Coalbrookdale the modellers and most of the designers for ironwork are or have been students of the school of art, and the same may be said of the tile factories of Messrs. Maw and others. At Glasgow the majority of those filling important posts in the factories have had the benefit of its training, and it is to be hoped that the town will not allow an institution of great value to its manufactures to continue so badly housed as it is at present. At Manchester some of the manufacturers are earnest supporters of the school, but complaints have been made that its work is not sufficiently comprehensive, being at one time too exclusively an art school, and at another, too much a school of design: it is, however, now making good headway, and increasing its hold on the estimation of the public. At Stoke-on-Trent the school of art had in its earlier years, a staunch and generous supporter in Mr. Herbert Minton, who insisted that his apprentices should attend its classes, and paid the fees of the girls during five years of their apprenticeship. His successors still insist on the attendance of the boys, and the school has turned out skilful workmen for the factories in large numbers, besides which ex-students are to be found in the several establishments, engaged as directors, painters, or designers, and in many cases they have superseded foreign aid. Pottery painting at Stoke has entirely changed its character since the establishment of the school of art, so far as its technical treatment is concerned, and the school has produced hosts of art-workmen. At Halifax, sixteen years ago, all the principal appointments as designers were held by foreigners; now, however, matters are altogether changed, for they are almost exclusively filled by ex-students from the school of art, which is also largely attended by youths whose business it is to transfer to "point" or squared paper the designs of their masters, so that a thorough acquaintance with freehand drawing is highly essential to success. At Lambeth a most important and extensive art-manufacture owes its very existence to the influence of the neighbouring school of art, cordially welcomed and allowed free scope through the enterprise and encouragement of Messrs. Doulton, whose art-pottery is distinctly original in conception and treatment. The Lambeth school always had a class of design, and about the year 1865 it occurred to Mr. Sparkes, then its master, that the students might as well make their designs in enamelled colours on the clay used for making tiles and other coarse ware, as upon paper in water-colours. He thought this course would add interest to the work, but had no conception of the extensive industry to which the experiment would lead. This beautiful and popular ware, as Mr. Sparkes observed in a lecture delivered in 1880 at the Society of Arts, is—

"A most excellent result of a genuine experiment made with the capital and artistic taste of a manufacturer, developed by purely local means. No local school in any part of the Continent could have done more than the Lambeth school has done to back up by its best efforts the demands made from time to time by Mr. Doulton. . . . It is a truly national production, and at the same time a local one, the direct outcome of the proper co-operation that ought to exist between schools of art and local manufacturers."

\* It has been suggested by Sir Philip Owen that an official list of students who have passed through the schools, showing the certificates they have gained, should be periodically published, and this might be made the medium of much useful and interesting information.

This modern development of industrial art, in which some 350 persons are employed, mostly females, could not have taken place but for the neighbouring school of art, which has supplied, almost without exception, the entire staff of the establishment, and con-

tinues to have the warm support of Messrs. Doulton, who, as one means of encouragement to the students, arrange that every certificate gained at the school shall carry with it an increase of salary. The school of art at Stourbridge, also, has had much influence on the glass manufactures of the district, and appears to have founded one important branch—etching on glass—which was started about twenty-five years ago. Cameo glass cutting has also been recently introduced, and great strides have been made in this as well as in other departments of the trade. In support of this statement the following passage may be quoted from an address delivered by Sir Rupert Kettle at the last Social Science Congress :—

“Without speaking of the special manufacture revived in Venice, I can say with confidence that no country has at any time produced such pure brilliant flint glass as the English makers now give to the world. As to design, whether in cut, engraved, or moulded glass, whether in rock, crystal, or cameo work, no such art-glass was ever before seen as that which is now being produced in my own neighbourhood.”

Notwithstanding such testimony as this, it has been objected that schools of art have hitherto but imperfectly accomplished their aim in the application of design to the manufactures of the country—that they have not been sufficiently technical in their teaching. But it should be borne in mind that technical work has always been discouraged by Parliament, on the ground that the public money must not be employed to subsidise trade in any way, and has also been strenuously opposed by manufacturers—who are now clamouring for its greater encouragement—and therefore schools that have developed into technical schools have done so on their own responsibility, and solely by means of their own pecuniary resources; those works only have had any claim to Government reward or encouragement which were strictly within the limits of the art directory, quite irrespective of questions of technique. It should have been mentioned that at one time a Jacquard loom was introduced into the schools, and from time to time various attempts have been made to establish classes for wood-engraving, chromo-lithography, pottery, &c.; but as soon as these reached the point at which they became useful it was thought expedient to restrain their operation, because of possible interference with trade.

## THE GLASGOW INSTITUTE OF ARCHITECTS.

THE annual general meeting of the Glasgow Institute was held on Tuesday—Mr. James Thomson, F.R.I.B.A., President. The following report was read by the Secretary :—

The Council beg to submit the sixteenth annual report on the affairs of the Institute. One new member has been admitted during the year—viz. Mr. Thomas Turnbull, architect, Wellington, New Zealand.

The competition for the War Office and Admiralty Buildings in London was again under the notice of the Council. Communications were received from the secretaries of the Royal Institute of British Architects, and from Mr. Horace Jones, architect for the Government, referring to the suggested modifications of the “instructions of architects” in the competition, and the advisability of printing these communications was considered, but it was resolved not to do so.

The draft of a proposed Building Act separate from the Police Bill having been drawn up and submitted by the president, a committee was appointed as to the matter, in order that the views of the Institute on the subject might be laid before the Lord Advocate. After various meetings and discussions the draft was printed and a copy sent to each member of Council. At several meetings of Council the draft was gone over and revised, and it was then determined to have the revised draft printed and a copy sent to all members of the Institute. While the draft was under consideration the secretary wrote to the Lord Advocate informing him that a draft Building Act was in course of preparation, and that when completed a copy would be sent him with the view of having another interview with him on the subject. A reply was received from his lordship intimating that he would have pleasure in again meeting a deputation from the Council and going over the draft with them. Thereafter the draft Act was considered and adopted at a meeting of the Institute, and Messrs. James Thomson, president, Campbell Douglas, and John Honeyman, past presidents, were appointed a deputation to wait on the Lord Advocate and confer with him on the subject. It was agreed that while a separate Building Act would be most desirable, yet, if absolutely necessary, rather than have delay they should agree to the Building Act forming part of the proposed Burgh Police and Improvement (Scotland) Act. A copy of the draft was forwarded to the Lord Advocate, who fixed a time to receive the deputation; but as he was unexpectedly called to London, where he was detained until the opening of Parliament, the intended meeting did not take place.

The Burgh Police and Improvement (Scotland) Act having in the previous session of Parliament failed to pass the House of Commons, a new Bill was brought in by the Lord Advocate in the

course of last session. A copy of this Bill was obtained and discussed, when it was found to be, so far as the architectural and other kindred clauses were concerned, substantially a reprint of the former Bill, no effect having been given to the suggestions of the Institute. The Bill was referred to a Select Committee of the House of Commons, and it was ascertained that the only way in which the members of the Institute might now have effect given to their suggestions was to forward a written statement of these to the members of Committee. A copy of the draft prepared by the Institute was accordingly forwarded to several members of the Committee, but owing to the Bill having been dropped by the Government no legislation has yet taken place.

The Committee have given much attention to the examinations in architecture, held in Glasgow in February, under the auspices of the Royal Institute of British Architects. The Council and the past presidents were appointed a Committee to take charge of the examination. In this they were assisted by Mr. Arthur Cates, chairman of the Board of Examiners, and Mr. J. Macvicar Anderson, honorary secretary of the Royal Institute of British Architects. The following is the Report by Messrs. Campbell Douglas and T. L. Watson, the conveners of the Committee :—

An examination in architecture qualifying for Associateship of the Royal Institute of British Architects was held this year in Glasgow, under the charge of the Board of Examiners of the Royal Institute and a Committee of the Glasgow Institute.

Six candidates presented themselves for the examination, which was begun on Monday, February 25. Four days were devoted to a written examination of the history and details of different styles of architecture, sanitary science, strength of materials, construction, shoring, and professional practice. The work included also the preparation of a design for a public library, with details and specification.

On Friday, February 29, the oral examination took place, and lasted from 10 A.M. to 6 P.M., with a brief interval. It was conducted by Mr. Arthur Cates, chairman of the Board of Examiners of the Royal Institute of British Architects; Mr. Macvicar Anderson, honorary secretary Royal Institute of British Architects; and the Committee of the Glasgow Institute.

The following were the successful candidates :—Messrs. James Ledingham, 1 New Ivgate, Bradford; Alexander McGibbon, 8 Douglas Street, Glasgow; James A. Williamson, 2 West Preston Street, Edinburgh; and Alexander B. Wilson, Brisbane, Queensland.

This examination in architecture is the first that has taken place in this country out of London.

The Council think that these examinations will prove very beneficial to the profession, and hope that a large number will come forward when the next examination is held.

The President and Mr. John Burnet were re-elected trustees of Haldane's Academy of the Fine Arts.

The Committee (Mr. Sellars, convener) appointed to consider the rules and regulations for the measurement of mason work in this district, or wherever the Glasgow mode of measurement is adopted, have completed their work and reported to the Council. They had before them the draft rules prepared by the Institute, those prepared by the Institute of Measurers and by the Master Masons' Association. After careful consideration of the three sets of rules, the Committee found that, except in a few instances, there are no serious differences in the rules as prepared by the three bodies, and they recommend that representatives of the two Institutes and the Master Masons' Association should meet to discuss and, if possible, agree on one set of rules, so that uniformity of practice in regard to this important matter may be secured in the future. In order to facilitate the work of this proposed conference, the Committee prepared a statement showing in parallel columns the rules applicable to the measurement of each department of mason work as suggested by the three bodies. Representatives from the Institute have been appointed, and the Institute of Measurers have been communicated with, but their reply has not yet been received. The table of fees issued by the Glasgow Institute of Measurers has also been considered and reported on by the Committee of Council—Mr. Sellars, convener—appointed for that purpose, and a communication has been sent to the Institute of Measurers.

The annual dinner of the members and friends of the Institute took place in the St. Enoch Hotel in February. Among other guests, there were present Mr. Arthur Cates and Mr. J. Macvicar Anderson, from London. An interesting address was delivered by Mr. James Thomson, the president, and a very pleasant evening was spent.

A communication was received by the Council from the Royal Institute of British Architects asking information as to the law and practice of Scotland as to light and air, and whether the present position of matters was found satisfactory. The matter was remitted to the secretary's firm, who prepared a report on the subject, which was forwarded to the Royal Institute of British Architects, and duly acknowledged by them.

The annual excursion of the Institute took place on Thursday, September 25, to Dalmeny Church, Hopetoun House, and the Forth Bridge. The party started in the morning from the Central Station, and arrived at Merchiston about eleven o'clock. From Merchiston they drove to Dalmeny church, where nearly an hour was spent examining this interesting building. Lunch was taken

in the well-known Old Hawes Inn at South Queensferry, and the party then drove on to Hopetoun House, the seat of the Earl of Hopetoun. The fine collection of paintings and other works of art here, and the building itself, were examined with great interest. About half-past three the party arrived at the Forth Bridge works, where they were met by Mr. Arrol, and the rest of the afternoon was spent in a careful examination of the undertaking. A drive to Edinburgh, and dinner in the Windsor Hotel, closed the excursion, and the party returned by an evening train to Glasgow. The weather all day was delightful, and a most enjoyable and instructive day was spent.

At a meeting of the Alexander Thomson Memorial Trustees, held in October 1884, it was reported that a suitable investment had now been found for the Trust funds, and Mr. John Shields was appointed factor and secretary to assist the Trustees in the administration of the Trust.

The Council recommend that the members of the Institute use their best endeavours to increase the membership of the Institute, and thereby enlarge its influence.

On the motion of the President, seconded by Mr. M'Gibbon, the report and treasurer's statement were unanimously approved of, and ordered to be printed and circulated among the members.

On the motion of the President, and seconded by Mr. Campbell Douglas, the following gentlemen were unanimously elected to be members of council for the ensuing year:—James Sellars, jun., William Landless, Hugh Barclay, John Gordon, John Murdoch, Robert Turnbull, T. L. Watson, David Thomson, James Thomson, Alexander Skirving, Wm. F. M'Gibbon.

On the motion of Mr. Campbell Douglas a cordial vote of thanks was awarded to Mr. James Thomson, the retiring President.

At a meeting of council, held after the general meeting, the following were elected as office-bearers:—Messrs. James Sellars, jun., 266 St. Vincent Street, president; Hugh Barclay, 136 Wellington Street, vice-president; William Landless, 227 W. George Street, treasurer; John Burnet, 167 St. Vincent Street, auditor; William Maclean, 81 Bath Street, secretary.

### SHAKESPEAREAN ARCHÆOLOGY.

A LETTER has been printed in the *Times* from Mr. H. Schütz Wilson on the costume and appointments of "Hamlet," which suggests the difficulty of deciding how far archæology should be employed on the production of Shakespeare's plays. The writer says:—The fact that Shakespeare's tragedy of "Hamlet" has once more been produced at a leading London theatre will, I hope, furnish me with an occasion of again arguing that this play should be costumed in the dress of the days of Elizabeth; in the dresses in which, doubtless, the play was first played; in the costume worn by Shakespeare, Spenser, Sidney, Raleigh. Shakespeare has made use, as a hint or suggestion, of a story suitable for his dramatic treatment, of the old legend concerning Amleth, as recorded by the old chronicler Saxo Grammaticus; but Shakespeare was a great poet and not a small archæologist, and his ideal tragedy does not, in very essence, belong to any age more strongly than that in which he conceived and wrote the immortal play of "Hamlet," which contains no essential characteristic of any day before that on which it was produced. Shakespeare has employed the thoughts, the manners, the philosophy, the poetry of his own time; and nothing is gained by moving the objective presentment of this drama backwards to the date of the dim old chronicle. Shakespeare, so to speak, thought out "Hamlet" in the dress of the spacious times of great Elizabeth; times already so far remote from our own that the habits of the men that then lived suffice amply for true dramatic illusion and for ideal vesture. When we see "Hamlet" we want nothing of the literal old Denmark of the chronicle—Shakespeare wanted nothing of that. He has caught from it only the idea, the suggestion, of a moving story, which he has so elevated by his treatment of it that it now belongs wholly to the pure abstract ideal; and our highest English dramatic ideal is that of the great day of Shakespeare himself. Surely the costume of the Elizabethan age is picturesque, and should be very dear to English fancy. While we gain nothing by setting the play back, we lose much, very much. We bring the mounting of the tragedy into direct antagonism with, at least, the manners depicted. Take a few instances. Were "counterfeit presentments" known when Saxo Grammaticus wrote? Was there then a company of travelling players, with a lad who played female parts? Could Amleth have felt that "a forest of feathers, with two Provincial roses on his razed shoes," would have got him a fellowship in a cry of players? Would Amleth have heard of an eyrie of player-children, little eyases, that were in Shakespeare's day the fashion? Could Amleth, or any man of his day, have thought those sublime thoughts about death and that which may come after death which Shakespeare gives to Hamlet to think?

One other point—a most important one—remains to be noticed. Shakespeare's Hamlet wears a rapier. When Hamlet "makes a pass through the arras" and kills Polonius, the pass is made with a rapier. The Queen says that her son "whips out his rapier" when he kills "the unseen good old man." For the

fencing wager the King imposes, as I take it, "six French rapiers and poinards, with their assigns, as girdle, hanger, and so on; three of the carriages, in faith, are very dear to fancy." The point need not be too much laboured, but it may well be asked if the art of *escrime*, which, in Shakespeare's day, Rowland Yorke was teaching to all the young nobles and gallants of London, was known in the days referred to in the chronicle?

Ophelia speaks of—

"The courtier's, soldier's, scholar's eye, tongue, sword;  
The expectancy and rose of the fair state,  
The glass of fashion and the mould of form."

Are such attributes proper to the times which Saxo Grammaticus records?

Can theatrical absurdity be pushed much further than to see a Hamlet who, through all the play, has worn a kind of short Roman sword, play a fencing match with the foil, or *fleuret*, which was the practice weapon for the rapier? By the way, the fencing match should be played with rapier and dagger.

It may be hoped that the next manager—Hamlet is now generally acted by managers—who revives this play of never-ending interest, will cease to grope dimly after the imperfectly-known costume of a very barbarous time, and will prefer to give us the graceful and romantic costume which suited, and which suits, the manners which Shakespeare depicts, and which belongs to the noble time in which the tragedy was conceived and produced. A Hamlet should never (if he can help it) be vulgar.

### BILLINGSGATE APPROACHES.

A MEETING of the City Commission of Sewers was held at Guildhall on Tuesday, Mr. Rose-Innes, the chairman, presiding. Mr. L. H. Phillips moved that in the opinion of the Commission the new diagonal street from the Monument to Lower Thames Street would not be required, considering that the opening of the street to Trinity Square would answer every purpose for the traffic, and that the several resolutions and orders in favour of making the diagonal street be accordingly revoked. Mr. Mathew seconded the resolution. Colonel Haywood, the engineer, in reply to questions, stated that the cost of the street would be about 336,000*l.*, and all the notices had been served upon the leaseholders and freeholders—50 in all. Of these 29 had sent in claims amounting to 238,000*l.*, and the agreements to purchase in some cases had been completed. Mr. Tickle urged that it would be absolutely impossible for a public body like the Commission to withdraw from its agreements in the way proposed. Mr. Alliston said the new street would be for the benefit of the riverside traffic, and the fruit and other trades, besides that of the fish-market, would be largely facilitated. That particular part of the city had been shamefully neglected of late, and the new street would be only a measure of justice. Mr. J. T. Bedford opposed the construction of a street which would burden the ratepayers of the City with a rate of 2*d.* in the pound for the next 30 years. Mr. Lyon, on the other hand, said that 2,000 vehicles passed to or from the Monument to Billingsgate daily, and the improvement was one which ought to be carried out without delay. After some further debate, the resolution of Mr. Phillips was negatived by 28 votes to 18.

### PROTECTION FROM FIRE IN THEATRES.

THE owners of the Marylebone Theatre were summoned by the Metropolitan Board of Works, at the Marylebone Police Court, on Monday, for that they, between the 28th day of February and the 29th day of July, neglected to make certain alterations necessary to remedy structural defects in the theatre, by which danger from fire might result to the public, after having been served with notice to do so. Mr. Grain, instructed by Mr. Thos. Burton, appeared on behalf of the Board, and Mr. Besley represented the owners. Mr. Grain stated that the requisitions served were seventeen in number, and the owners had neglected to carry out ten of them, some of these being of a most important character. The proceedings were taken under the 41 & 42 Vic. cap. 32, sec. 11, which imposed a penalty of 50*l.* in case of default, and 5*l.* for every day during which such default continued. No notice of appeal having been served, the requisitions became binding upon the owners, and Mr. Hebb, assistant-architect to the Board, was called in support of the Board's case.

Mr. Besley, for the defence, contended that the requisitions of the Board had been complied with as far as was practicable, and called Mr. Thomas Verity, F.R.I.B.A., in support of his statement.

The magistrate, Mr. De Rutzen, said the Act of Parliament was a most important one, and ought to be strictly carried out, and that he had nothing whatever to do with deciding whether or not the requirements of the Board were necessary. His duty was merely to impose a penalty, to show owners of such places as theatres that the requisitions of the Board must be complied with in the interests of the public. He should not impose the full penalty of 50*l.*, but a mitigated penalty of 10*l.*, including costs.

## NOTES AND COMMENTS.

It will be remembered that England is represented by Professor KERR on the International Jury to whom the selection of the designs in the competition for the Amsterdam public buildings has been entrusted. In consequence of a prohibition by his doctor, Professor KERR has been compelled to resign his position on the Jury, and Mr. R. PHENÉ SPIERS has been appointed to be his successor. It would be ridiculous to question Mr. SPIERS's capabilities for the office. A man who has drawn and studied almost every building in Europe which has any merit should be competent to know good from bad architecture, and a host of past and present Academy students would be found prepared to testify to Mr. PHENÉ SPIERS's impartiality and sense of honour. Indeed, it has been to us a wonder that his services have not been more often secured by public bodies as an assessor in architectural competitions in this country.

THERE is no competitive examination to test the capabilities of art critics, and it is sometimes assumed that every novice is qualified to discover the weak points in the works of the best painters. A country reporter lately sought Mr. RUSKIN's advice as to how he was to deal with an art exhibition when he was without any special knowledge of art. Mr. RUSKIN, in replying, said: "Supposing—which I hope your question does suppose—the country reporter to be a man of natural sense and intelligence, the best thing that he can do is to describe carefully the subjects of the pictures he thinks likely to please simple people, if they are shown what is in them, and, as far as the editor will allow him, to take no notice of pictures attracting merely by their tricks of painting. I do not think the public value the affectations of art knowledge in a newspaper reporter, but they would always be grateful to him for the indication of elements of interest in a picture which they would have missed without his help." Would it not have been more just to the artists who paint pictures if Mr. RUSKIN advised the country reporter to refrain from indicating elements of interest until he had attained, by study, some elementary notions of art? If a similar question had been put to the late THOMAS CARLYLE, we can imagine what kind of reply must have followed.

It is anticipated that in the course of the ensuing term there will be almost constant grumbling about the lighting of the Courts of Justice. Some new machinery for the electric lighting has been introduced, and, instead of being placed in the vacant ground attached to the Courts, it has been introduced into a cellar under the main entrance. It is possible that all will be in working order before the dark days of November; but, to anyone who has observed the rate of progress during the past month or two, that result is not so clear. In descriptions of the old Courts at the beginning of the century, one reads of the impressive effect which was produced when STOWELL or GRANT or some other of the great judges commenced the delivery of a judgment in a dimly-lighted court. The darkness was supposed to give additional awe to the occasion. Who knows but that modern judgments might become more effective if they were heard by jurymen and the auditory in the galleries, while the Court was in a state of semi-darkness?

A PROCESS was described lately before one of the French societies which might be found useful in offices where amateur photography is not entirely unknown. It is called "photocalk," and appears to be adopted in official departments whenever a plan which is engraved or drawn is made the basis on which some other is to be constructed. Thus, for example, it may be an advantage to use a closely-engraved ordnance sheet in preparing a map of a railway or other project; but when the new work is laid down there is a difficulty in removing those parts which are superfluous. In such a case it is proposed that a photograph of the sheet should be taken upon salted non-albumenised paper. The print is not toned in the gold bath, but is dried after a simple fixing by hyposulphite. On it the draughtsman can lay down his details in ordinary Indian ink. The plate is then immersed in a bath containing  $1\frac{1}{2}$  parts of bichloride of copper to 10 parts of water, when all but the new lines will disappear. It is afterwards washed and treated with hyposulphite of soda, and finally bleached by means of cyanide of potassium. If several copies are required, the print has to be transferred to stone or zinc.

There is room for some process of the kind; and the improvements which have been made in reproductions of ordinary writing suggest that something will yet be done of a similar kind for draughtsman's work.

THE Executive Committee who have been appointed to take charge of the fine art section at the Wolverhampton Exhibition after the closing of the industrial department on the 31st inst., have decided to ask each of the guarantors to guarantee 5,000*l.*, instead of 500*l.*, the sum originally fixed upon. They state that they do not anticipate there will be any loss in carrying on the exhibition, but that they merely wish a form of protection against the remote contingency from damage from any other cause than fire, which latter will, of course, be covered by insurance. The Fine Art Exhibition is to remain open for three months, and many exhibitors have given their consent to a detention of their pictures during that period.

ARTISTS and tourists who propose to visit the district between Vigo and Pontevedra, in Portugal, where scenery is to be found that will repay a long journey, will be glad to hear that the line of railway between the towns is nearly completed. They will, in consequence, have many advantages in travelling which were formerly denied them, in the way of quick transit and freedom from being crowded with uncongenial companions in a dirty and lumbering diligence. The new line will be also a great boon for the carrying of merchandise *en route* to Santiago or Compostella.

THE men who are least likely to suffer from remorse are those who carry off antiquities from public and private collections. It is therefore worthy of being recorded that one of the class has a conscience which retains its capacity of making its owner uncomfortable. Aston Hall, near Birmingham, was lately deprived of a few articles, including a dagger and a bayonet. On Monday a platelayer found on an embankment near the Soho Station a parcel which contained the stolen treasures. They were accompanied by the following brief note:—"I hope to be forgiven. I took these from Aston Hall. The finder will please restore them." The culpable archaeologist, we suppose, parted with the parcel because of the difficulty of disposing of the goods; but, whatever may be the motive, it would be well if he found imitators.

THE Trustees of the Rhind Lectures have acted wisely in requesting Sir SAMUEL FERGUSON, Q.C., to deliver a course on "Ogham Inscriptions." It is not often that a lawyer attains eminence as an archaeologist; but Sir SAMUEL is the president of the Irish Academy, which has done much for the preservation of Irish antiquities and for the promotion of research. He is also a poet, and his reputation is not confined to Ireland. In almost every book of extracts the stirring "Forging of the Anchor" finds a place. It first appeared in *Blackwood's Magazine*, and "CHRISTOPHER NORTH" then foretold that the author would be again heard about. Edinburgh is now realising the prophecy.

AN important compensation case has been decided in Scotland. The Glasgow and South-Western Railway Company required land at Greenock on which a saw mill stood for one of their extensions. The sum of 25,000*l.* was offered in compensation; the occupier claimed 37,634*l.* After a trial, in which some of the foremost counsel were engaged, the jury assessed the damages at 27,899*l.* 4*s.* 8*d.* The land was valued by them at 23*s.* 6*d.* a yard, 10 per cent. was allowed for compulsory sale, 7,134*l.* for the buildings and machinery, and 3,127*l.* compensation for loss of business.

THE general depression of the building trade continues to be felt by the timber merchants in the North of Europe. It is reported from Christiania that last year was more unfavourable than even the preceding years to forest owners and shippers. Prices abroad fell steadily. The bad state to which the Norwegian timber trade has been reduced is undoubtedly due to over-production, which, however, will be checked by continued low prices. There are no symptoms of any increased demand abroad, and it is therefore to be desired, in the interest of all who are concerned in the trade, that the winter felling of trees in all timber-producing countries should be somewhat restricted. Building materials of pine declined most in price, owing to the increased competition of American spruce.

## ILLUSTRATIONS.

DAWPOOL, CHESHIRE.

WE publish this week several illustrations of a house in Cheshire, which is in course of erection from the designs of Mr. NORMAN SHAW, R.A., with the aid of Mr. J. F. DOYLE, of Liverpool, as local architect. Nearly all of the originals have been exhibited this year at the Royal Academy. The work has been carried out by local contractors, and in a style which has given satisfaction to Mr. NORMAN SHAW.

## THE INDUSTRIAL ART EXHIBITION IN PARIS.

THE exhibition organised by the Union Centrale des Arts Décoratifs in order to obtain funds to establish a museum of industrial art is now fully arranged. The first of the present series of exhibitions was held in 1880, when artistic metal-work formed the special collection. In 1882 art in carved wood, textures, paper, leather, book-binding, and furniture was brought together; and in the present exhibition stone carving, wood used for artistic construction of buildings, with china, terra-cotta, and painted glass, are the special objects. This is the eighth exhibition held under the auspices of the Union Centrale des Arts Décoratifs, the last before 1880 having been held in 1876, when the series was interrupted by the great exhibition of 1878. Although it is to be feared that these biennial gatherings become too much like large bazaars for selling fancy articles, it may safely be said that the one now open is very fine of its kind. There is not enough, perhaps, of musical attraction to induce throngs of Parisians to crowd the Palais de l'Industrie in the Champs Elysées, as Londoners do the Healtheries; yet the exhibition is fairly popular, and is meeting with a proper share of public attention and support.

One of the chief attractions, says a correspondent of the *Scotsman*, is a large darkened chamber in the centre of the ground floor, where the stained glass of the immediately past years is shown to great advantage. One house, Champigneulle, of Paris, formerly of Metz, exhibits no less than twenty-one magnificent examples of painting on glass all of which have been executed this year. Several are copies—doubtless for new churches—of famous windows in ancient places of worship, such as St.-Eustache in Paris and the cathedrals of Bruges and Bourges; but most are new works for private houses or theatres. Some of these are treated quite out of the old conventional ill-drawn style, and are delightful applications of natural forms to this always charming method of decoration. One is for Mons. F. G. Dumas, the editor of the *Salon Notes*, and is in the Japanese style, something after the manner of La Farge, of New York, whose works are so much out of the ordinary run. Another attraction in the exhibition is the Salon d'Honneur du Président Grévy, erected in the place of honour for the use of the President at the opening of the collection. This forms a very similar feature to the Prince of Wales's pavilion at the Fisheries and the Healtheries in London, being superbly furnished by one of the leading houses in Paris. The specimens of carved wood are confined chiefly to the erection of small buildings, the best being that of a Swiss chalet, where the bricks and the wood form a very agreeable artistic combination. The stone carving is also confined (almost necessarily so by reason of size) to models; but of china and terra-cotta there are numerous stalls and collections. Judging impartially, it may be said that Messrs. Doulton, of Lambeth, have as fine a set of specimens as any, and there is an air of real utility about their exhibits to which the somewhat gimcrack French works never attain. In artistic erections there is a capital imitation of a waterfall, and many examples of the application of wood to decorations of all kinds. Attached to the exhibition, and forming a very important portion of it, is a collection of national manufactures. These are the products of the State establishments for the manufacture of china at Sèvres, tapestry at Beauvais, and tapestry and mosaics at Les Gobelins; and a comprehensive idea may be obtained from them of the many beautiful and artistic objects made specially for State purposes, and not for sale—such as for presentation to foreign Princes or to foreign Courts, as well as for the decoration of the many provincial museums and hôtels de ville throughout France.

It was in 1695 that the first French porcelain was manufactured at St.-Cloud; but in 1713 and 1735 other establishments were created at Lille, Chantilly, and other places. In 1753 Louis XV. named the chief factory, then at Vincennes, a royal manufactory; and six years afterwards this was removed to Sèvres, where, under all the varying régimes, the production of works of art of the finest kind has continually proceeded. In 1879 a school of ceramic art was commenced, where twenty young men are taught all the processes of the manufacture, and they may either remain in the State establishment at Sèvres or go elsewhere fortified with the *imprimatur* of the finest school in France. The collection now on view gives examples of every kind of work done at Sèvres, from the immense imperial vases of royal blue to the

little five o'clock tea-sets with only the tiniest ornaments on the little dishes. The manufactory of Gobelins tapestry dates from the beginning of the seventeenth century, and sixty years later the far-seeing Colbert obtained for it the title of Manufacture Royale des Meubles de la Couronne, adding goldsmiths' work and wood carving to tapestry weaving. In 1664 the manufactory of Beauvais was established from workers who previously wrought at the Gobelins. At both these places there are a small number of pupils allowed to be taught the mysteries of the art, so that the work may not degenerate, but rather improve. The Gobelins tapestry is so well known that no description of it is necessary. The finest in the present collection is a reproduction of the famous Louvre picture by Ingres of the *Crowning of Homer*, where, by a cunning mixture of tints, the tone of the painting is admirably imitated. Besides this there are many tapestries of small subjects, all wrought with the greatest care. When the French set their minds on promoting any particular branch of the fine arts, there is no doubt that they go in for it heartily. It is, therefore, likely that the new museum will very soon be one of the attractions of Paris; and it behoves our industrial art-workers to look well to their interests, so that the French do not again too far outstrip them in the pursuit of the art of making our homes and surroundings as beautiful as may be desired.

## EARLY CELTIC MONUMENTAL INSCRIPTIONS.

THE course of Rhind lectures on "The Ogham-inscribed Monuments of Ireland" has been continued by Sir Samuel Ferguson, Q.C., President of the Royal Irish Academy. The second lecture began by describing the district in Ireland in which these Ogham-inscribed monuments first attracted learned attention. The barony of Corkaguiny, in the county of Kerry, is continuous with the long peninsula which, reaching out more than thirty miles westward into the Atlantic, separates the Bay of Tralee on the north from the Bay of Dingle on the south. After passing a ravine which separates the mountain of Slieve Mish from the lower eminences of the Slieve Mish group, the traveller enters the parish of Ballinvoher, a rough, lonely country, but abounding towards the sea in remains of circular huts and other dry-stone constructions, indicating a former ill-civilised but numerous population. Here, some distance up the mountain declivity to the right, in the townland of Rathmalode, there formerly existed a rath, or earthen fort, and in it a cave, the lintel over the entrance to which, having on it a cross and an Ogham inscription, was transferred to the adjoining townland of Lougher, where it served the same purpose over the door of a farmer's dwelling until removed to the Royal Irish Academy in Dublin, where it now is. After citing Colonel Lane Fox's account of the construction of those rath caves, the lecturer gave an account of a monument higher up in the recesses of the mountain, westward of Lougher, and at a farmstead in the townland of Ballynahunt. This monument stands attached to the gable of one of the farm buildings, whither it had been brought from a holy well higher up the mountain, to the east. It is a cross of the Latin form, incised on the broader end of the stone. An Ogham inscription has occupied both arrises and the top of the narrower end. Were the stone set up so as to exhibit the cross, the Ogham would be concealed in the earth. This, however, is what they might be led to expect if they looked to our oldest written evidences for information regarding the form of such monuments, and the arrangement of Ogham legends on them. It might be that the Ballynahunt inscription exemplifies the supposed practice of hiding the sepulchral epigraph underground; but other examples are not wanting of Ogham-inscribed flag-stones laid flat on the surface, and this may very probably have been one of that class. Old as it may be, however, the Ballynahunt stone is a Christian monument, not only evidently by its cross—for he put aside the idea of Christian crosses having been superadded to Pagan sepulchral monuments as resting on no evidence or reasonable presumption—but not improbably by the terms of the inscription itself. The reading appears to be—*Degenngel magi reddos*. One digit only of what he supposed to be *l* remained at the top; and, unless the character be *l*, the explanation of this strange sequence of syllables which presented itself to his mind at the time when he first examined the monument, must be discarded. He thought, then, the name might possibly be *Dugreddos*; divided by the interjected words *Ennggel magi*, "apostle of the son," and not *Dugenngge* or *Dugennggub*, "son of Reddos," as it has by others been taken to be. An example of this kind of word-intercalation, on the possibility of which he had here speculated, is found in the verses improvised by Columbkille on the death of Longarad of Kilgarad:—

Is marb lon  
do cill garad, mor in don—  
Athbath lon  
i Cill garad, mor in don.

Dead is Lon (of Cill) garad—great the evil!  
Died hath Lon (in Cill) garad—great the evil!

where "do cill" and "i cill" are interposed between the constituent parts of Longarad's name. If other monuments should

appear to suggest something of the same kind of dispartition of proper names, it would be well to bear the Ballynahunt legend in recollection. Sir Samuel proceeded to describe similar monuments in this district. He next spoke of a remarkable cave at Aghacarrible, in the parish of Kinard. It is regarded as a rath rather than a killeen or burial-place, and it had a cave similar to the rath caves. This cave is only a few feet below the surface, is 5 feet wide, and 4½ feet high. Its walls bear Ogham legends. After describing the interior, Sir Samuel said the inference which commends itself most to the mind in contemplating such an interior is that the materials already inscribed with their monumental epitaphs have been brought from some neighbouring cemetery; and this gives rise to a consideration of no little interest and curiosity. The cemeteries which are found adjoining such caves, and from which the materials of the caves have presumably been brought, are generally of that class of burial-places called *killeens* or *cealluraghs*. These are very numerous in the south and west of Ireland. They are not used for the interment of Christian adults. In most of them the burials are confined to unbaptised infants. How could they account for the semi-sacred yet unholy character of these cemeteries? The writers who assert a Pagan origin for Ogham writing regard them as the burying-places of the old Pagan population, and on this ground account for the want of reverence for their grave-stones shown by those who plundered so many of them to obtain materials for the construction of their rath-caves. In support of this view it is alleged that the Ogham inscriptions found in rath-caves never bear the Christian emblem. And this is generally true. They had seen, however, that the cross on the Gurtneagullagh stone did not protect it from being used as a lintel over the doorway of the cloghan there; and, in fact, in this cave of Aghacarrible one of the wall stones, although not Ogham-inscribed, bears two incised crosses, and has presumably, as well as the others, been brought from some killeen or disused cemetery in the neighbourhood. The theory assumes a total disuse of the Pagan cemeteries by the early Christians, save for the interment of the unbaptised, which is not consistent with the course of the social transition from Gentileism to the Faith elsewhere. Pagans and Christians repose in the adjoining *loculi* of the Catacombs. The repugnance indicated may have sprung from another source, to which a wider survey of the evidence might yet lead them. The lecturer proceeded to describe the monuments and killeens in some degree of detail, and brought forward a good deal of evidence to show that they were of Christian rather than of Pagan origin. After speaking of one, a rare, instance in which a killeen, or kiln, or burying-place, with an Ogham-inscribed cross over it, was found in connection with existing ruins of a church, and with an evidently Christian monument erected in it, he said the question would be asked, Why was the cemetery now regarded as unfit for adult Christian burial? Why and when did it come to be so regarded? Whether an answer could be given to these questions must depend on a fuller survey of the remaining evidences; but they would perceive that these killeens had a wider interest than they might at first have appeared to possess. He spoke of a second killeen or *cealluragh* in this district, also disparaged by the faithful, and reserved for the unbaptised. It is at Kilfountain. Continuing westward through the townland of Maumanorig, in Marhin parish, midway between Temple Manahan and the Dunurlin Road, will be found a third *cealluragh*, and in it the foundation of a ruined church and a stone monument bearing an Ogham legend of a more complex, and, so far, a novel character. That it is a Christian monument is attested by two Maltese crosses, one of them supported on a stem, as on the Aglish example. The inscription is carried round the face of the stone, which is a boulder apparently *in situ*, on an artificially cut stem-line, and at first sight appears to present the following singular succession of syllables—*Anmcolololn alilltair*. Sir Samuel related how he came to read this inscription, "Columb the Pilgrim," concluding that this was the person in whose epitaph these pains had been taken to disguise his name and manifest his Christian labours. In conclusion, he said that up to this point they had regarded *magi*, "son of," as a genitive. The suffixed *i* has been considered inflectional and equivalent to the infixed *i* of *maic*, the more modern genitive of *mac*. Here it appears indisputably to be in agreement with the nominative *Erc*, and excites renewed doubts as to these Oghamic forms being governed by ordinary grammatical laws. The *ias* genitive for nouns ending in *c* and *n* is again exemplified in an inscription at Dunmore Head, which, rugged and weatherworn as it is, must be considered one of the most valuable for philological use or warning, as the case may be, hitherto brought under notice.

In his third lecture on Monday last, Sir Samuel Ferguson continuing his description of the Ogham inscriptions found in Kerry, said that turning back from Dunmore Head, they came to the harbour of Smerwick, on whose shores, in the townland of Ballinrannig, formerly stood seven Ogham-inscribed monumental pillars, four of which were now at Burnham. One bore the name Broinionas, which, like the term Corb, indicated a practice of applying names of humiliation in Ogham epitaphs. Leaving the cairn of Cill-Vickallane, or the "graveyard of the sons," as it was called, the lecturer passed on to Kilmalkedar, where there was a comparatively large church of that Hiberno-Romanesque style

which Petrie had endeavoured to show was earlier developed in Irish than in British examples. Among the gravestones in this Christian cemetery was one Ogham-inscribed pillar, which seemed to read "angel" before the principal name. Dealing with Mount Brandon, the lecturer referred to the "crumthir" pillar, which stands at a height of 2,000 feet in the townland of Arraglen. Two crosses on the pillar sufficiently attested its Christian character, but on the western front ran the Ogham legend "Qrimitirros." Proceeding along the seaward face of the mountain, and descending towards the coast village of Cloghane, in the townland of Clonsharagh, they came upon three great "gallauns" or standing stones. Their aspect was not such as our present information would lead us to expect in Christian monuments, and Ogham digits existed on the side and top arris of the great block in the centre of the standing group. Leaving Brandon mountain, he proceeded eastward to Castlegregory, in Killaney parish, where, built into the chimney-piece of a farmer's cottage, formerly existed an inscribed stone now in the collection of the Royal Irish Academy. One other Ogham inscription in Corkaguiny was found at the ruined barbaric fortress of Cahir Conree, which was the fort of Curoi, son of Dari, a name famous in Irish romance, the rival of Cuchullin, by whom he was slain in his mountain stronghold, through the treachery of the faithless Blanaid, who milked the fatal white cows with the red ears into the stream as the signal for attack. Northward of the Shannon, in Clare, there was only one Ogham inscription, but it was a monument in many ways worthy of note. The much-discussed Mount Callan inscription was on a flagstone bearing an Ogham legend which at once struck the eye as belonging to a school of inscriptional work, strongly recalling the style and appearance of what might be called the scholastic Oghams of the books. The characteristics of these examples were a pen-drawn stem line and vertical stem-crossing vowels as distinguished from oblique stem-crossing consonants. On the Callan Monument not only were the words divided by the points over and under an incised stem line, but the whole legend was set in an incised frame or cartouche, giving at first sight, to those acquainted only with ordinary Ogham, an unexampled and questionable aspect. Irish antiquaries, however familiar with the word separations of Scottish Ogham legends, no longer looked on these points with suspicion, and the surmises of fraud and forgery which at one time discredited that monument might now be regarded as altogether displaced. No one could look on the faint, weather-worn digits without a strong persuasion that the inscription was many centuries old, and, of whatever age, a genuine piece of work. But its tenor was quite different from that of any other Oghamic sepulchral legend. The word-divisions indicated the necessary course of reading.

Fan : lia : do lica : con(II)as : colgae : cos : obad—

"Beneath this stone," although a formula foreign to Oghamic sepulchral language, need not necessarily be more modern than the *sub hoc congeries lapidum* of the Carausius monument in Wales, adjudged by competent scholars to some time before the eighth century. As yet no success had attended the effort to extract anything more intelligible than that rendering which *prima facie* presented itself, however suspicious its appearance, "under this stone lies Conas (or Collas) (the) sword-accomplished, the (fleet) footed." Re-crossing the Shannon into Roscommon, the traveller was taken to Rathcroghan, the old residence of the Con-naught provincial kings. The pillar-stone of Dathi was still standing, but the name to which he would call attention was that of a personage even more renowned than Dathi in connection with Rathcroghan, the Amazonian Maev, whose wars with her former husband, Conor, King of Ulster, formed the subject of the great Irish romance of the "Tain bo Cuailnge." Her name lived in the topography of the country, although contemporary with that of Augustus; and an identical name had been preserved in Ogham in a cave, which also bore her name, close by the great mound of Rathcroghan, which she inhabited. About 300 yards from the Relig-na-ree was a smaller disused and churchless cemetery, also circular, within the area of which were the entrances to what was traditionally known as "Queen Meave's treasure-house." Sir Samuel Ferguson next touched upon the Ogham monuments in Tyrone, and the few that existed in Derry and Donegal, referring, in conclusion, to those in Meath, where the Slieve-na-Calliagh hills, for a distance of two miles, constituted a vast cemetery of scattered sepulchral cairns, supposed to be the remains of Irish pagan interments. From the ornamentation of these cairns and the etchings on the bones, he concluded that a higher art co-existed with the use of traditionary barbarisms in sepulchral monuments.

**A Tunnel**, measuring about 5,000 feet long, and constructed at least nine centuries before the Christian era, has just been discovered by the Governor of the island of Samos. Herodotus mentions this tunnel, which served for providing the old seaport with drinking-water. It is completely preserved, and contains water-tubes of about 25 centimètres in diameter, each one provided with a lateral aperture for cleansing purposes. The tunnel is not quite straight,

## A GERMAN COMMERCIAL MUSEUM.

FOR some time past the Frankfort Chamber of Commerce have been considering the advisability for the erection of a Commercial Museum on the pattern of the Musée Commercial in Brussels, which should render it possible for the traders and manufacturers of Southern Germany to inspect the products of foreign competition, and thus become clear as to the means to be taken to meet it successfully. As the first step it would be necessary to have the co-operation of the foreign Imperial German Consulates, as they would have to send in samples of the leading products of the foreign industrial countries, together with information about the sale, price, mode of packing, &c. It would then be the duty of the museum to arrange these samples systematically, and to associate with it an office for the requisite information, and a commercial library.

Meanwhile, stimulated by the Royal Ministry of Commerce, and by invitation of the elder society of Berlin merchants, and of the Secretary-General for the Central Union of German Industrial Classes, as well as of the German Commercial Diet (Handelstag), a conference on this subject took place in Berlin on November 24, 1883. The invitation mentioned that it would be seen at once that the best consular report be insufficient to describe and to judge as to pattern, quality, manner of production of the article required, and that the raising of a commodity can only with certainty be formed when that commodity is before the producer *in natura*, with the requisite explanations; and to this end the erection of an Imperial Commercial Museum in Berlin, on the pattern of the Musée Commercial erected some years ago in Brussels, would well prove itself qualified to be the means of imparting great stimulants to industry, and also to point out many new paths for export trade. Such a museum would be called to fill the same place and to guide the export trade in a manner as the geological, anatomical, and such-like collections, guide the field of natural science. For this purpose, and by means of the consuls, not only all those fabrics would have to be included, which in different countries enjoy a notable sale, but the exhibition of these articles would, with the necessary explanation also, offer to German manufacturers the opportunity of considering the possibility of supplying the products in question, and putting thus the possibility into practice.

To this end interested communities would not only, through the catalogue, be accurately instructed in the peculiar tastes, wants, and addresses of the different buyers, but would also be informed about the freight, expenses, and the import duty thereon, and be thus enabled to judge at what price the articles must get produced. In this manner the German manufacturer would really be in a position to judge practically the circumstances which come under consideration in his competition in the markets of the world, and in the constant high development of home industry; the greatest hopes may without doubt be attached to this. On the other hand, it need not be specially stated here that the foreign raw produce suitable for improvement and further employment in German trade, as well as those natural treasures, materials, and products to be appropriated for commercial purposes, would also find a place in the museum.

Frankfort was represented at this conference by their Lord Mayor, Dr. Miquel; by their member of Parliament, Mr. Sonnemann; and by Mr. Sulzbach, a banker, who moved a resolution that while they welcomed with pleasure the idea of erecting such a museum in the chief city of the empire, yet they believed that in this matter centralisation would be a great mistake, and that a branch establishment for South Germany should be erected in Frankfort. In support of this resolution it was argued that for the manufacturers of Central and Southern Germany, the journey to Berlin was too far and too expensive. For this reason the intended institution must have at least one branch. Even in Belgium the suitability of a second place was felt, and besides the museum in Brussels, one in Ghent was lately erected, and which is not one-fourth the distance from Brussels that Berlin is from Frankfort. Not only is Frankfort the centre of an important foreign traffic, it is also the centre of a large number of factories of smaller but highly-prized articles. Sixteen millions of the inhabitants of Germany gravitate towards Frankfort, viz., those of Bavaria, of Wurtemberg, of Baden, of Alsace and Lorraine, and of Rhenish Prussia, who would rather go to Frankfort than to a far more distant northerly town like Berlin. As the consular reports and consignments of products and patterns would be the same for Berlin and Frankfort, the Government would be caused no extra expense by the erection of two museums, but would be about the same as necessitated by one.

The Frankfort merchants would be quite willing to raise the cost of a site for the erection of such a museum of commerce. They therefore asked that, should this question be favourably considered by the Imperial Government, they would then not only provide for such a trade museum in Berlin, but also for one in Frankfort, and that they would instruct the German consuls to send the leading and newest products that compete with Germany in duplicate, namely, one collection for Berlin, and one for Frankfort.

After this the following resolutions were passed:—"The meet-

ing held here to-day for confidential conference on the subject of the erection of an Imperial Museum of Commerce in Berlin, declares that the formation of an Imperial Museum of Commerce in Berlin, and of one or more branch establishments arranged for the same purposes—namely, that home trade and industry may gain information about the productions, and especially the foreign competition requirements, as well as the circumstances relating to this subject—is an affair of the greatest economical consequence and of the most urgent importance. The meeting therefore resolves the appointment of a committee, with power to add to their number, which committee would be authorised, in connection with the Central Association of German Manufacturers, the German Mercantile Assembly, and with the co-operation of the body of Berlin merchants, to stimulate the interested circles of Germany as well as the German Imperial Government to take the necessary steps towards its realisation."

## THE METROPOLITAN BOARD AND THEATRES.

THE following report on theatres and music-halls, in reference to a letter received from the Lord Chamberlain, was presented from the Building Act Committee, at a meeting of the Metropolitan Board of Works, on the 17th inst. :—

"(1) Your sub-committee have to report that they have had before them a letter from Sir S. Ponsonby-Fane, of the Lord Chamberlain's Office, dated July 9, 1884, asking what course the Board would suggest with regard to the future issue of the Lord Chamberlain's licenses to theatres. Allusion is made in this letter to the fact that the Board have now nearly completed the work of putting the theatres into a structurally safe condition, and it is stated that the Lord Chamberlain, being most anxious to act in concert with the Board for the safety of the public, would gladly continue to refer to them in all cases before the issue of his licenses if the Board would still be prepared to give him the benefit of their opinions as to the structural security of the buildings, and the efficiency of the fire appliances. In a further letter, dated July 25, 1884, Sir S. Ponsonby-Fane encloses a list of twenty-six theatres (exclusive of nine still undergoing alteration), in respect of which the Lord Chamberlain wishes the Board to inform him whether his annual license can be issued with due regard to the safety of the public. Your sub-committee quite agree that it is desirable that there should be a periodical inspection of theatres for the purpose of ascertaining whether anything has been done to neutralise or diminish the effect of the works executed under the Board's requisitions, but at the present time this is a responsibility which rests upon the Lord Chamberlain, and which could not be assumed by the Board without express statutory authority. His lordship appears to be aware of this fact, for in a subsequent letter to the two above-mentioned, and which was referred to your sub-committee on August 6 last, he expresses the opinion of himself and the Home Secretary that the Board should insert in some Bill to be introduced into Parliament next session a clause making it compulsory for places of amusement to have a certificate from the Board as to the security of the buildings for the public before applications are made for licenses. Your sub-committee are of opinion that the Board should adopt the course suggested by the Lord Chamberlain, provided that power were taken at the same time to charge a fee to owners of theatres to cover wholly, or in part, the expenses of such periodical inspection. They recommend that the Clerk be instructed to address a communication to the Lord Chamberlain to the effect that the Board, having completed their requisitions with respect to the structural alterations required at the various theatres existing in the metropolis at the time of the passing of the Act of 1878, do not propose to take any further action with respect to such theatres, unless in any case they shall receive an official intimation from his lordship, as the result of an inspection made by an officer of his department, that additional structural alterations have been subsequently made by the owner of the theatre; but that the Board would have no objection to cause an annual inspection to be made of each theatre, but are of opinion that the cost of this service should not be borne by the ratepayers of the metropolis, but that the Board should be empowered to charge the owners of theatres a fee for the service rendered."

Mr. Selway said the Board had done the work it undertook to do in respect of the structural defects of theatres, although it was not able to do all it wished; but the Board had no staff to attend to further improvements. The portion of the public who went to theatres was but a very small portion, and for the whole of the public to be taxed for the management structurally of theatres would be very unjust indeed. If the Board was to be called upon for the expense of structurally altering theatres it ought to be entitled to receive the fees, and not those who did not do the work. If the Lord Chamberlain wished to have the entire management of theatres and the regulation of the length of ballet-girls' skirts, by all means let him take his own course, but he contended that this Board ought not to be called upon to pay for it.

The report was adopted by a majority of 26 to 1.

The Building Act Committee presented the following report on Her Majesty's Theatre:—"Your committee have to report that they have from time to time had under consideration the question of the steps it is desirable to take with respect to Her Majesty's Theatre, Haymarket. The Board's sealed notice requiring certain structural alterations to be completed within a period of six months was served upon the owners on February 12, 1884, and two months after this date the superintending architect reported that the works had been begun, but that little progress had been made. On May 19 the owners informed the Board that the whole of the alterations relative to the audience part of the theatre were completed, but it was impracticable to complete the others while the theatre was open. On July 15 the superintending architect reported that the various important works required by the Board had not been carried out, and the owners were reminded, by direction of your sub-committee, of the approaching expiry of the notice on August 12. The superintending architect has since the recess again surveyed the theatre, and found that the works are not completed and that the theatre is closed. The committee recommend 'that the solicitor be instructed to intimate to the owners that unless such alterations are completed before the opening of the theatre the Board will take legal proceedings to enforce compliance with their requisitions.'" The report was received and adopted.

The Building Act Committee reported that they had considered the application of Messrs. Francis on behalf of the council of the Albert Palace Association for a certificate by the Board, under the Metropolis Management and Building Acts Amendment Act, 1878, with respect to the construction of a concert-room, to be called Connaught Hall, at the west end of the Albert Exhibition Palace buildings, in Prince of Wales's Road, Battersea. This concert-room is 205 feet long and 118 feet wide, and forms part of the Albert Exhibition Palace. It consists of a nave, which has a span of 50 feet 6 inches, and is 58 feet high, and two aisles, which are each 33 feet 9 inches wide and 30 feet high, with galleries over them. The total number of persons for whom sitting accommodation is furnished is 3,900, of which number 1,500 will occupy the galleries. The building is of an unusual construction, and does not conform to the Board's regulations for places of public entertainment in some important particulars. It is not enclosed by walls constructed in accordance with the Building Act, but chiefly by structures of glass and iron. It is not separated from the premises of which it forms part by proper party walls or party structures. The staircases are made of wood, and so are the floors of the corridor. From the details given in the report of the superintending architect, it also appears that the staircases are generally of insufficient width and some are inconveniently planned. The ironwork of the concert-room is not protected against the action of fire, and the position of the hydrants is not shown in the drawings. A separate means of exit from the gallery landing directly into the street is not provided. Having regard to the numerous points in which the building does not comply with the Board's regulations, the committee recommended that the certificate be not granted. The report was adopted.

### THE CHAMBERS' MEMORIAL.

SOME further particulars have been given of the plan prepared by Mr. W. Hay, architect, for providing in St. Giles's Cathedral a memorial to Dr. W. Chambers. It is proposed to open up the old vestry by cutting out an archway in the thick wall which separates it from the church. Originally this vestry appears to have been the sacristan's house of the old collegiate church. From the old engravings of the north side of the building it would seem to have been an offshoot for such a purpose, as it showed domestic-looking square windows in several storeys. Mr. Burn in his formal restoration in 1829 gave it externally some importance by inserting a tall Decorated window of three lights on each side of its two outer sides; but internally it is only a room of about 11 feet square by nearly 30 feet high. The proposal now submitted is to make it something like the St. Eloie Chapel, on the opposite side of the transept, stripping off the lath and plaster from the walls, and for the flat plaster ceiling substituting a handsome groined vaulted roof of stone, the walls being lined with the same material, and the floor paved with inlaid marble. The arch would be boldly moulded, and the chapel thus formed enclosed with a wrought-iron railing, like the other chapels. The architect's design shows a marble cenotaph or pedestal with foliated panels bearing appropriate coats of arms, angelic figures supporting wreaths at the four corners, and a recumbent figure of the munificent restorer of the cathedral, sculptured in Carrara marble, on top. To this feature of the design the Lord Provost's committee has preferred the stained-glass window which was proposed as an alternative. It remains for the Town Council to say whether they will adopt this recommendation, or decide in favour of the marble, leaving for some private donor what private donors have in the case of the cathedral shown a laudable readiness to undertake—the providing of the painted window.

### THE AMERICAN CHURCH IN PARIS.

A SERIOUS impediment, says a correspondent of the *Guardian*, has arisen to the completion of the handsome church which the American Episcopalians are building in the Avenue de l'Alma. It has now been in the course of erection for about two years and was expected to be ready for provisional use by Christmas, and to be finally inaugurated by Easter next, at the latest. Now, however, an unexpected obstacle has occurred which will greatly delay these intentions. It appears that a Jura marble of a too fragile description has been used for the clustered shafts which support the pier arches of the nave. The consequence has been that these columns have proved unequal to the support of the superincumbent weight of the edifice, and have begun to crack and splinter under the pressure imposed on them. The whole building has been obliged to be shored up with wooden arches and ponderous beams placed under the pier-arches, while ten at least of the clustered columns of the nave will have to be removed and replaced by a more solid material. The expense and labour attendant upon such an operation will be very great, and the time required will probably delay the completion of the church at least six months beyond the date anticipated. The difficulty will, no doubt, be met and overcome. But its occurrence, and the prolongation of the work, will prove a serious strain upon the energies of the highly esteemed rector, Dr. Morgan, who has been already so long and anxiously occupied in the completion of the enterprise, and now sees his expectations disappointed just as they seemed on the point of fulfilment. One can only heartily wish him safely through these new difficulties. Some time ago, when looking over the church, it was pointed out to the correspondent as a more correct style of Gothic construction that the segments of the columns were much longer, and, therefore, more perpendicular, than was the case in similar French architecture. And, certainly, French builders generally form their columns of very short segments, and in the case of Classical buildings, like the Madeleine, of circular blocks hardly thicker than a millstone. The effect of so many joinings is not agreeable to the eye; but the solidity attained, both as to resisting pressure, or even a slight shock, is much greater. The too great length of the segments of the columns in the above case seem to have been one cause, perhaps, why the marble had not been able to bear the strain which was put upon it.

### OXFORD IMPROVEMENTS.

THE Oxford papers give a long list of the architectural improvements and new buildings which have been in progress during the past year. First comes the Indian Institute, at the corner of Broad and Holywell Streets, of which Mr. Basil Champneys is the architect. It is in the Jacobean style, with ornaments illustrating the fauna and flora of India. The weathercock on the turret, for instance, is in the shape of an elephant. Only a portion is yet ready, consisting of kitchen, store-rooms, porter's lodge, four lecture-rooms, parts of the library and museum, with offices for the curator and sub-curators, and the porter's living-rooms. The cost of this portion is 12,000*l.*, and some 6,000*l.* or 8,000*l.* will be required for the remainder.

The Physiological Laboratory at the Museum, facing the park, is in the Renaissance style, with many large windows. The architects are Messrs. Deane & Son, of Dublin, and the cost (10,000*l.*) will be defrayed by the vote in Convocation, which caused so much excitement early in the year. The restoration of the Bodleian Library has been completed for some time.

Among the colleges, Trinity have begun a new quadrangle on the site of the President's kitchen garden, of which the east side is finished. The north end of this building contains a reading-room lighted by an oriel window, the buttress supporting which is the only break in the straight east front. There are besides two oriel windows at the south end. There are twenty-seven sets of rooms, large lecture and reading-rooms, &c. The architect is Mr. T. G. Jackson, of London, and the cost of the work is 11,000*l.*

The new buildings of Corpus are at the angle of Merton and Grove Streets, next to Beam Hall, and will form the south side of a new quadrangle. There are three sets of rooms on each of the three floors, besides coal-cellar, scullery, and servants' room in the basement. The north side is broken up by a projecting bay, which forms the staircase inside. Until the future extension is finished, the entrance will be through the cottages. The architect is Mr. Jackson, and the cost between 3,000*l.* and 4,000*l.*

Several alterations in Oriel Chapel have been made by Mr. Jackson:—"The screen has been removed 11 feet further to the west, thus throwing this amount of additional space into the body of the chapel. This has been utilised by the erection of two new seats, seating five each, and four new fronts as well as five panel stalls upon each side. On the north side the oak stairs have been pierced, thus looking through into the ladies' pew, which has been fitted up by the old work taken from behind the screen. The organ gallery formed over the screen is approached by an open staircase in the north-west part of the ante-chapel. The gallery front, the end and the two sides, are filled with open-carved panels of

elaborate design. The chapel has been heated with hot water. The whole of the seats have been pulled up and fixed on new floors, and the marble floor taken up and relaid. The stonework of the window at the east end has been taken out and new work substituted in its place, the design matching that of the side windows. This is to be filled in with stained glass."

The principal's lodgings at Jesus are being extended in the direction of Ship Street by Messrs. Bodley & Garner. Besides this, a new oriel window has been inserted on the first floor facing the quadrangle, and the dining-room beneath has been rearranged. The oak panelling in this room has been cleared of paint, so that the original woodwork is once more seen.

At Christ Church a new organ has been erected in the cathedral by Messrs. Wills & Son, under the direction of Mr. Lloyd. The original organ was destroyed by the Puritans in 1644. In 1680 Father Smith built a new one, which was repaired in 1826 by Bishop, and enlarged by Gray and Davidson in 1848. Under the direction of Dr. Gosse it was removed in 1873 by the latter firm from the south transept to the screen at the west end, further additions to it being made at the same time. In the new instrument only a few pipes of the pedal organ, with some of the basses of the stopped diapasons have been retained, the *Oxford Chronicle* remarking that "some may regret the loss of the little that remained of Schmidt's work; but it is well to remember that the tone of modern organ-work seldom blends well with the old."

At St. Mary's Church back rails have been fitted to the gallery seats, "at the wish of a well-known Oxford divine, who generously paid all expenses." Betteris's billiard-rooms and the City Arms, an ancient alehouse opposite the west door of St. Mary's, formerly used as an evening resort by college servants and the Vice-Chancellor's attendants, has been remodelled, and, under the name of St. Mary's Entry, forms a residence for Professor Wordsworth.

Many alterations are in progress on various parts of the river. A new weir has been made alongside the old one at Sandford and two new iron bridges thrown across the front and back streams of the lasher. New weirs have also been constructed at Abingdon and Sutton Courtney. The old lock at Folly Bridge has been done away with, and the river dredged as far as Osney Lock, where a new weir and basin have been made. Osney Lock itself is being reconstructed on improved principles.

## UNIVERSITY COLLEGE OF NORTH WALES.

THE University College for North Wales was opened on Saturday last. The classes are held in a large building which at one time was well known as the Penrhyn Arms Hotel. It has been remodelled for college purposes under the direction of Mr. Richard Davies, architect, Bangor. In planning the laboratories and fittings advantage was taken of the experience of Professors Dobbie and Gray, who readily gave their valuable assistance. The large coffee-room, on the ground floor of the western wing, measuring 46 feet by 20 feet, will be used as a common hall for students, and as a dining-hall for professors and students. In the eastern wing, which was occupied by Her Majesty during her visit to Bangor, the wall which divided the wing internally into two apartments on every floor has been removed, and the necessary constructive alterations made to form one lecture room on each of the three floors. These rooms, which measure 40 feet by 20 feet, are assigned to the departments of English, mathematics, and classics respectively. Two other lecture rooms, each 29 feet by 24 feet, have been obtained by the removal of the partition walls which divided the western part of the main block into four apartments and corridor on the first and second floors; these are for philosophy and modern languages. The two rooms on the ground floor in the central part of the building hitherto used as bar and parlour, respectively, have been provided with a glazed vestibule, through which there is a direct communication to and between the rooms, and is fitted up as library. A servants' passage and service room, with hatch, has been formed to afford convenient access between the kitchen and dining-hall. A small room, situated between library and passage to dining-hall, has been fitted up as a lavatory for students. The western staircase, which extended from the ground to the first floor, has been continued up to the second floor. Communication is thus obtained from the rooms on the first floor of the western wing to those of the second floor, which hitherto was obtained through a corridor, now cut off by the formation of lecture-rooms. These rooms are being now arranged as two suites of private apartments for the principal and registrar. The communication between the eastern wing and the central part of the building on second floor has been stopped, and the space before used as passage has been fitted up as a cloak-room, and together with the adjoining lavatories assigned to the use of lady students. The increased superficial dimensions of the principal rooms, without a proportional increase in height demanded, when the new uses to which they were to be put were considered, that particular attention should be given to ventilation. Some of the lecture-rooms have Boyle's patent ventilators for admitting

fresh air, and Boyle's extractors on the top of chimneys. The alterations have been done by Messrs. Robert & John Williams, builders, Upper Bangor; the desks supplied by the North of England School Furnishing Company. The extensive stable, coach-houses, and yard have been formed into laboratories and lecture theatres, with suites of rooms attached. These buildings, which measure 120 feet by 80 feet, include two lecture theatres, each 34 feet by 34 feet by 19 feet high, divided from each other by a corridor 5 feet wide, and, by means of movable partitions, will give a spacious hall 76 feet by 34 feet for distribution of prizes, and the public demonstration. Students' laboratories, combustion room and balance room occupy the western side, and in the central portion, on main floor, are professors' laboratories and private rooms, preparation and apparatus rooms, &c., for the respective departments. Over the central portion just described is another floor containing magnetic room, in the construction of which no iron is used, optical and photometric room, photographic room, spectroscopic and gas analysis rooms. Flats, which are approached by staircases from this floor, are provided on the roofs for open-air experiments. With a few unimportant alterations, the basement has been utilised for workshops, stores, &c. The style of architecture which characterises the old buildings has also been preserved in the new; a bolder treatment has, however, been adopted. Mr. John Hughes acted as clerk of works.

## THE PLUMBERS' CONGRESS.

THE Congress of Plumbers at South Kensington, which has been organised by Mr. George Shaw, the Master, Mr. Towse, and other officials of the Plumbers' Company, has been most successful. The meetings on Monday and Tuesday were attended by a larger number than had been anticipated. Circulars had been sent to the mayors of the different towns in the three kingdoms, inviting them to nominate two representatives among the local plumbers, and, in consequence, members of the trade had journeyed to London from various parts of the three kingdoms. Mr. George Shaw presided on both days. A number of papers were read dealing with the technical instruction of plumbers, apprenticeship, the establishment of metropolitan and provincial boards of examiners of plumbing work, the registration of plumbers, and the formation of district associations. Dr. Ernest Hart referred to the complete absence of control in existing Acts of Parliament over the internal drain system of domestic houses. In the course of the discussion it was urged, in view of the importance to the public health, that plumbers should be responsible for their own doings, and a resolution was passed declaring it to be desirable that architects should not in future include plumbers' work in builders' contracts. Mr. F. C. Penrose, the architect of St. Paul's, concurred in the desirability of this separation. In regard to apprenticeship, it was considered desirable to foster its general resumption, and that to accommodate it to modern conditions, five years should be the maximum time, whilst two years of further engagements with any employer subsequent to completion of articles should be required before granting a certificate of full capability as a workman.

On Tuesday, resolutions were passed in favour of the registration of plumbers, the establishment of examiners of work done, and the formation of local Associations. Finally, it was unanimously agreed that the Plumbers' Company should be requested to adopt the best means of carrying out the various proposals, and of uniting the plumbers throughout the kingdom in a bond of trade relationship and in common action for the advantage of the public and the benefit of the trade.

## LIMOGES.

WHEN we first saw Limoges in 1857, says Mr. E. A. Freeman, in an article in the *Guardian*, its great church was still a fragment. It had something of the air of Köln. About one-half of a great French church rose high in the air, and at some distance to its west rose a tall and slender tower of a most singular air. But the tower did not, as at Köln, suggest imperfection as well as the unfinished body. There was no crane to show that there still was work to be done; and, though, as we come to learn more of the history of the building, we find out that the tower has been shorn of a spire, yet no one at first sight would say that a spire was at all needed. That is to say, in 1857 the church of Limoges was altogether unfinished. All that was left of the Romanesque church was the lower stage of the tower. Far to the east of it a magnificent church of the later French type had been begun; the choir and transepts were finished; the whole nave had been traced out and begun, but only about two bays were ever finished. In the sixteenth century the thought of carrying on the work seems to have been given up, as then the church was in a manner finished inside by adding a great organ-loft, handsome after its own fashion. The Romanesque church, in short, had given way to a Gothic church which remained a frag-

ment, and so a gap was left between the actual church and the tower. In 1857 there was talk of filling up the gap, and now in 1883 it is all but filled up; in short, the nave is now nearly finished. The work reminds one of Bristol, only to finish the lofty nave of Limoges was a greater work than to build the far lower nave of Bristol. Also at Bristol there was no ancient tower standing near where the west end had been or was to be, whose existence could not fail in some measure to influence the finish of the new work. At Bristol the architect could design his west front how he pleased, and we may be allowed to doubt of the wisdom of adding western towers to so small a church, especially as their addition implied the destruction of a still surviving piece of the monastic buildings. At Limoges there was the more frightful danger lest the ancient tower should be doomed to give way to the modern architect's notions of a west front. There was some such fear in 1857; but happily it seems to have passed away in 1883. It must be allowed that the tower stands awkwardly in the way of the new work, as it is not in the same line, and will have to join on in some way at a corner; but the new building seems to be adapted to it so far as it may be. The contrast will be great, and the tower will lose a good deal of its seeming height by having so lofty a building attached to it. But the two must agree as they can. No one could wish the tower to be touched, and no one can quarrel with the completion of the body of the church.

The tower is a strange building enough. On a vast square base which, if itself carried up as a tower would bring down Wymondham and even Ely to utter insignificance, stands a much narrower square stage, from which rises a slender octagon of three stages, set on in an unusual fashion—lozenge-fashion, if that word may be applied to an octagon, reminding one somewhat of the way in which the upper stage of the tower of Cartmel is set on the lower. This is the custom of Limoges; the towers of the other two surviving churches of the city have just the same character. Like some of the work at Angers, they keep the lines of the earliest Gothic; but their real date is late in the fourteenth century. The other two churches, those of St. Michael and St. Peter, keep their spires; the spire of St. Stephen's is gone.

These Limousin towers have a certain interest as examples of a very local form. We may doubt whether we really admire such singular height and slenderness and piling of stage on stage, very different from the artistic composition of such a tower as Bishop's Lydeard. But they are at any rate striking from their boldness and novelty. But the tower of the cathedral church has a far higher interest. To know what it really is we must go inside. The square base is masked by a casing, perhaps of the last days of the eleventh century; but within is the lower stage of the tower of the original Romanesque church, which, we can hardly doubt, stood as a detached campanile. The lowest storey, after a fashion rare but not unique, stood open. Four large columns, with their round arches, supported a kind of cupola. But the design was ruthlessly disfigured when the tower was cased. The columns were walled up and pointed arches were inserted; but it is not hard to call up the original effect, which may be seen in a less changed state at Le Puy, where however square piers take the place of columns. The odd thing is that the lowest stage of these towers presents the exact design of a Byzantine church of the smallest scale, lacking only the eastern apse. Yet there can be no reasonable doubt that both these buildings were meant to be what they are, the lower stages of towers; only that at Le Puy has been carried up with great skill in a later form of the same style, while at Limoges the far later tower sits with some measure of awkwardness on its ancient base.

When we first saw Limoges in 1857, there were still to be seen on the west face of this tower the traces of a church contemporary with the blocking of the columns and the introduction of the pointed arches. They have now given way to the necessities of the work of finishing the imperfect nave. They point to a church of considerable height, with aisles, very plain and simple, but using the pointed form in its constructive arches. Now, what is the date, first of the blocked columns, secondly of the work that blocks them? There was at Limoges an ancient basilica, attributed to Saint-Martial, the apostle of Limoges, in impossibly early times. Rome and Ravenna cannot show churches of the third century or earlier. But we need not doubt that a fellow to the churches of Rome and Ravenna lived on at Limoges till about 1012, when Bishop Hilduin began or at least ordered the building of a new and larger church. This is witnessed by the Aquitanian chronicler, Ademar of Chabannes. In 1095 Pope Urban consecrated this church or some other on the site. The present church was begun with funds left by Bishop Aimeric de la Serre, who died in 1272. Here are our dates. The tower in its oldest shape, if it stood along with the old basilica, must have been an addition to it. It would do very well for work of 1012; but Hilduin's church was barely begun, if begun, and its tower, if it had one, would be much later than that date. We are tempted to suspect that the four columns are older than 1012; that the blocking of those arches and the church of which we see traces against the recased tower belong to a rebuilding, begun perhaps in 1012, but carried on slowly, and perhaps not fully finished in its

western part even at the dedication in 1095. In this way the appearance of the pointed arch—here, as in Italy, a sign of the Saracen—really becomes no great puzzle. Under the present choir is a crypt, which ought to throw some light on the Romanesque building. But as it can be seen only by lifting up a stone which takes six men to stir it, it is pretty well forbidden ground to the ordinary traveller.

We now pass from this tower, precious relic of an earlier time, to the later church, the church which is now hastening to meet the ancient tower. Here we find ourselves carried into another world of art and history. Limoges cathedral, or so much of it as is built, is one of the loveliest examples of the best French Gothic style. We say French advisedly; by the year 1273 the elder local forms of art had pretty well passed away. One general model prevailed through the whole of what had now become the kingdom of France. And within that kingdom few buildings can, for internal effect at least, outdo such a church as the still fragmentary Saint Stephen's of Limoges. It does not come in point of scale in the first class of French churches; it does not rank with Bourges, Chartres, or Saint Ouen's; the dimensions on the ground plan even of the completed church would in England place it very low indeed, and even in France it does not cover anything like the same ground as the great buildings which we have just named. And, much smaller in extent, it is also, by all laws of proportion, by no means their rival in positive height. But its relative height is fully equal to theirs; it has all the loftiness which distinguishes a French church from an English one, and we fancy that it must be positively higher than any English church except Westminster and York. And though the arch of the vault is perhaps a little too low, there is no church of any scale or country in which the internal design is, on the whole, more skilfully managed. The leading design of the elevation is that of the lofty pier-arch and tall clerestory, with only a small triforium between them. It is a problem in such a case to design the triforium so as to make it a subordinate, or at least an intermediate feature, and yet not to make it insignificant. It should not be either so prominent or so unimportant that anybody could wish it away. We admire, perhaps without altogether approving, the glazed triforium at Saint Ouen's, and, on a smaller scale, in the choir of Saint Peter's at Chartres. But this is not the purpose of a triforium. It suggests the retort that, if you want more glazed space, you should make a longer clerestory; and the clerestory in both those churches is quite long enough. The Limoges triforium is, as it should be, an essentially internal feature, a modest feature, a feature not asserting any special prominence, but whose absence would at once form a blank. The transepts, too—a difficult part of the building to deal with in these churches without central towers—are dealt with here with thorough skill. The architect of Limoges cathedral tried the same experiment which was tried by the architects of St. Mary Redcliff and of Bath Abbey. He made his transepts considerably narrower than the nave and choir. At Limoges, where there was to be no central tower, it was open to the designers to make the transepts narrower if they chose. At Bath it had the absurd effect of making the central tower oblong, as it doubtless would at Redcliff, if the tower had ever been finished. But even in the other cases the experiment was a daring one, and we cannot help thinking that the experiment at Limoges succeeded better than the experiment at Bristol. The transepts, somewhat like the triforium, are after all a secondary feature, specially when there is no central tower. They must be not insignificant, and yet they must not be so prominent as to overshadow the eastern and western limbs. At Limoges, where there never can be any real west front, we might have approved of a great façade to the transept better than in some other places. But the narrowness hindered anything like the great fronts of Chartres; the designer adapted himself to his conditions; instead of a rose window, to which there was not breadth enough to do justice, he made a very noble pointed window with a prominent spherical square. Within, the narrowness at once marks the transept as subordinate, and at the same time gives it a character of its own; the effect of height is of course greater than in the wider parts of the church. The experiment in short has succeeded. We do not, as in some French churches, wish the transepts away on the ground of insignificance, nor yet do we feel, as in some others, that they have taken to themselves an importance which belongs only to the east and west ends of the building. And the discretion of the Limousin builders seems to have lived on through many generations. The church went on building, with some interruption, from 1273 to 1554, and the difference between the work of different dates is plain enough. Yet all is thoroughly harmonious. We see that there is work of different dates, not by any change in the general effect, but wholly by the details, mainly by the change in the tracery of the windows which in the western parts of course becomes Flamboyant—good Flamboyant, be it observed. There is no building in which one can better sit and gaze and muse—looking of course eastward or else across—than in St. Stephen's at Limoges. The effect of some of the vaster churches is more overwhelming; there is none which is more thoroughly satisfactory, none which is at once more pleasing to the eye and more thoroughly commends itself to the critical judgment. If there is

a fault, it is that the vaulting arch is a little too flat; but its flatness is not so great as to have the same killing effect as in the metropolitan church of Rouen.

### THE SCOTTISH SOCIETY OF WATER-COLOUR ARTISTS.

THE exhibition of the Scottish Society of Water-Colour Painters has been opened in Glasgow, and on the 17th inst. the annual luncheon was given. Mr. Francis Powell, R.W.S., president of the society, was chairman.

Mr. James Muir, in proposing the toast of "The Scottish Society of Water-Colour Artists," said that some who were present might be surprised to learn that in 1761 there took place in Glasgow the first exhibition ever held in the Kingdom of Scotland. It was held under the auspices of men who might be called the pioneers of art in Scotland—the brothers Foulis. It was held in the open air, in the quadrangle or court of the university. As showing the manner in which the pictures were hung, he mentioned that a very famous picture by Rubens, *Daniel in the Lions' Den*, was placed two-thirds up the steeple, immediately over the bust of Zachary Boyd, which many people would doubtless recollect. The academy of the Foulis's was not a success, and was ultimately broken up and sold in London at ruinous prices. In 1821 an enterprising gentleman named Alexander Findlay, the father of a well-known printseller, got together a loan collection and exhibited it and formed what might be called the first institute which Glasgow had for the promotion of the fine arts. Two exhibitions only were held, and then there was a hiatus of six or seven years, when the Dilettanti Society sprung up and held exhibitions for a long time in the Argyll Arcade. The exhibition was removed to 51 Buchanan Street, with the result that it collapsed in the year 1838. After that there was another hiatus of two years till 1841, when one of the most meritorious movements was originated which had ever been started in the West—he referred to the West of Scotland Academy. Exhibitions were held in the Argyll Arcade; but the premises being required for a warehouse, the Academy removed to Buchanan Street. The exhibition was closed in a couple of years. The Academy continued to enrol members till 1864, and it was not till 1879 that the final meeting was held. He thought, from what he had stated, it would be seen that Glasgow had taken an interest in art from the very earliest times. That interest had been taken under the most adverse circumstances, and quite apart from the influence of that commercial spirit which drove men to do things merely for the purpose of making money. It was in 1861 that the Institute of the Fine Arts had been begun. Through bad report and good report it had continued to prosper, until it was in the position of being able to hold out a helping hand to one of what he considered the finest societies in Scotland—the Society of Water-Colour Painters.

The chairman, on behalf of the society, heartily thanked the gathering for the manner in which they had honoured the toast. Many of those present were doubtless familiar with the earliest efforts of the society; he was sure they were all pleased to mark the steady progress which they had made. Some eight years ago many of the artists who now had pictures on the walls could scarcely be said to have painted a water-colour picture, partly owing to want of encouragement and partly owing to the way in which water-colours were treated at some of the exhibitions. This slighting treatment of a refined art determined some of them to establish a society on the lines of the Royal Water-Colour Society of London. The Scottish Water-Colour Society was the outcome of that determination. The art of water-colour painting had suffered from many aspersions, which, however, had been proved to be utterly false. Sometimes it had been said that the body colour of the Chinese white turned black; sometimes that the pictures were thin and poor; and sometimes it was objected that there was glass over the pictures. But the most persistent attack was the allegation of want of durability. Now, in the first place, Chinese white did not turn black. Again, it was not the case that water-colours were necessarily thin and poor; and as to the glass before them, had they not seen some of the most cherished old pictures with glass before them, and was it not a good thing to preserve pictures beneath glass? He had had the good fortune this spring to see two water-colours of very ancient date. One was a portrait of Guillaume Budé, dated 1467, and the other a portrait of Doge Verdomini, dated 1475. He could assure those present that they were as fresh, as beautiful, and in as perfect condition as if they had only been a year old. In Liverpool, at present, there was a most important exhibition of water-colour art at the Walker Art Galleries, the like of which might never occur again. It was an exhibition under one roof of the works of the three leading water-colour societies of London. It was most interesting and instructive to mark the difference in the style of the three. They might almost belong to three individual schools. In going over the exhibition one was forcibly struck by the greater refinement of the water-colour pictures over these in oil in the neighbouring rooms. He afterwards mentioned, for the benefit of his professional friends,

that the best works were by those artists who most carefully noted the smaller beauties of nature, and showed a love for the humbler phases. They saw the same thing in the works of their best writers, who endeared themselves by a care of humble things. Look at their own great national poet Burns; and then there was that celebrated word-painter Ruskin. Did any of them recollect how he glorified the common lichen? He called it "the humblest and most honoured of earth's children," and he said that "it is strong in lowliness, that it neither blanches in heat nor pines in frost. The worm frets it not; the autumn wastes it not; sharing the stillness of unimpassioned rock, it shares also its endurance; while the winds of departing spring scatter the white hawthorn blossom like drifted snow; when the summer dims on the parched meadows the drooping of its cowslip gold; far above among the mountains the silver lichen-spots rest star-like on the stone; the gathering orange-stain on yonder western peak reflects the sunset of a thousand years." If the Scottish Society received the encouragement it deserved, he felt sure that Scotland might in time come to be as proud of her water-colourists as she was of her oil-painters.

### LEGAL.

Walsall County Court.—October 16.

(Before Mr. W. D. GRIFFITHS, Judge.)

ROARKE v. BODEN.

EMPLOYERS' LIABILITY ACT.

In this case the sum of 150*l.* was claimed. The defendant contracted for repainting the Walsall Guildhall. The plaintiff was engaged by him as a scaffolder, and in one room he had erected a scaffold in the usual manner. When he went to another room defendant told him not to put up a scaffold, but to work with two ladders and a plank from the one to the other, so as to form a stage. He alleged that after he had fixed the plank and ladders, and properly spragged them, the defendant's foreman altered the arrangement by putting one of the ladders more upright, the result being that the plaintiff was thrown down and injured about the arm and side to such an extent that he was an inmate of the Cottage Hospital for ten days, and had since been out-patient and unable to work. His Honour held that the fact that the position of the ladder was altered by the foreman was not conclusive as to the cause of the accident, or as to negligent employment, and nonsuited the plaintiff.

### ENGINEERING WORKS.

**Becles Bridge.**—A new road-bridge, 94 feet long, over the river Waveney, and connecting the counties of Norfolk and Suffolk, has been opened. The main girders are placed 20 feet apart in the clear, forming a roadway of that width, which is supported upon Messrs. Lindsay & Co.'s patent plough-rolled steel flooring, No 5 section, weighing 30 lbs. per foot super. This floor is rivetted to the bottom booms of the two main girders, and is filled in with concrete. The continuous main girders rest upon four cast-iron screw piles, of 30 inches diameter in the shaft, and of one-inch metal, and having the screw 4 feet in diameter, with a pitch of 6 inches; and at the ends upon masonry abutments. The centre span of bridge between the screw-piles is 50 feet from centre to centre, and forms the present navigable channel of the river. The side spans are each 20 feet in the clear. The piles are screwed down about 30 feet below the bed of the river, resting upon a bed of coarse gravel, and are filled in with cement concrete. Each pair of piles are braced by an iron girder at the low-water level. The abutments and wings are constructed of ashlar work from the materials obtained from the old bridge, and rest upon timber pile-work and concrete. The superstructure of the wings is formed of ashlar quoins and dressed flint work, laid in courses. Four of Messrs. Macfarlanes' No. 6 gas lamps are fixed, one at each end of the main girders. The whole of the iron-work in the bridge has been supplied and erected by Messrs. Head, Wrightson & Co., of Stockton-upon-Tees, and Mr. T. H. Blyth, of Foulsham, Norfolk, has executed the rest of the bridge-work and the approaches. The cost of the new work approaches 3,000*l.*

**Inland Navigation.**—A meeting of the Liverpool Engineering Society was held on the 8th inst., Mr. R. R. Bevis, jun., in the chair, when a paper entitled "Inland Navigation Works Abroad," was read by Mr. R. L. Tapscott. The author, in treating of his subject, dwelt on the accomplishment of the great canal works of recent years as a result of the improvements in the various mechanical appliances now substituted for hand labour, and the benefits thence arising, instancing the successful maintenance of the Suez Canal as the forerunner of the many suggestions for inland navigation now brought forward. Admitting the difficulties of the Panama Canal to be considerable, he held that they were yet of a similar nature to what have been overcome before; but, all taken together, presented an unparalleled series. Whatever the cost, however, the work had every appearance of proving a financial success. Passing on, the Amsterdam Canal was

instanced as illustrating the surmounting of difficulties which the early part of this century dare not approach. Amongst the other works and schemes mentioned were the entrance to the Mediterranean by means of the Garonne River, the flooding of the Sahara, the draining of the Zuyder Zee, the improvement of the Neva, and the piercing of the isthmuses of Malacca, Florida, and Corinth.

### CHURCH BUILDING AND RESTORATION.

**Durham.**—A new Congregational church is about to be erected in Claypath, Durham, from the designs of Mr. H. T. Graddon, architect, of that city. The church will accommodate 480 persons, and will be built of stone throughout, in the Early Geometrical style of Gothic architecture. A handsome tower and spire, over 100 feet high, will adorn the main front.

**Glasgow.**—A large church has been completed for the congregation hitherto worshipping in Wellington Street United Presbyterian Church. It occupies the corner of Ann Street, Hillhead, immediately to the north of the Glasgow University. The principal front of the church consists of a portico of ten fluted Corinthian columns, approached by an open flight of steps. Three large outer doorways lead into the vestibule; four doors open from the vestibule into the area floor of the church, while stairs on each side lead to the galleries. At the north end of the church other two gallery stairs are provided, and there is a spacious corridor on each floor. The church itself is about 90 feet by 60 feet, and 47 feet high inside. Its general form is rectangular on plan, with a gallery recess at the south end and an organ recess at the north, the latter being covered by a half dome, richly moulded and decorated. The ceiling of the church consists of three arched or vaulted spans, carried on two longitudinal beams stretching from end to end of the church, and without pillars. The sides of the ceiling are coved and groined, and the whole is enriched with arched ribs and panels. The construction of the roof is of a novel character, consisting of two lattice girders, about 80 feet long and over 7 feet deep, stretching from end to end of the church. Between these two girders the middle arch of the ceiling rises, and between the walls and the girders the side arches spring, and the ceiling is thus supported entirely on the girders and side walls. The roof principals and purlins are also of iron. The church is provided with side and end galleries, and seats 1,050 persons, with a liberal allowance of space to each. The width of exits is nearly 50 per cent. in excess of the minimum rule laid down by authorities on this subject, and all the doors open outwards as well as inwards. The acoustic qualities of the church have been the subject of careful study, and all that experience could suggest has been done to make the undertaking successful in this respect. The proportions of the building, form of ceiling, the setting out of seats, and the materials used throughout the interior have all been considered with regard to their influence on sound. To the north of the church are situated the hall, 50 feet by 35 feet, with an end gallery; the library, 35 feet by 21 feet; and session-house, vestry, ladies' room, and numerous class-rooms, together with a church officer's house. The total length of the building, including the outside stair, is about 200 feet, and its width at the north end is 100 feet. The height of the apex of pediment above University Avenue is about 75 feet. The columns of the portico and side walls, of which there are twenty, are 35 feet high and 3 feet 6 inches diameter. The total cost of the building (exclusive, however, of the cost of site, organ, furniture, &c.) is 15,000*l.* Mr. T. L. Watson, F.R.I.B.A., is the architect.

### SCHOOL BUILDINGS.

**Morley.**—The new Wesleyan Sunday Schools are now complete. The walls are of Morley Finsdale stone. The buildings include an assembly room, 55 feet by 36 feet, on the ground floor, on three sides of which is a gallery, the total height from floor to ceiling being 33 feet 6 inches. The rostrum is placed at the end of the room, and will accommodate ten or a dozen persons. The room is lighted by two large two-light windows in the gable, with windows also along each side wall. The ground floor will seat 500 and the galleries 400, making total accommodation in large room 900. The columns supporting the gallery are continued up to the ceiling line, dividing the roof into three parts, forming nave and side aisles. Along the sides of the ground and gallery floors are provided twelve class-rooms, each 12 feet by 9 feet, also four 14 feet 6 inches by 12 feet, and four larger ones 18 feet by 17 feet 6 inches, making twenty in all. A commodious infants' school, compact in plan, well lighted, and thoroughly adapted for its purpose, is provided in the basement, giving 8 square feet per child. This room will accommodate 300 infants. There are two entrances from Queen Street to the infants' school, and two also from the chapel yard into the assembly room, which form the connecting link to the chapel. The finished wood-work inside is of pitch pine, varnished. The schools have been designed by and carried out under the supervision of Mr. Walter Hanstock, architect, Batley, and have cost the sum of 3,468*l.* 3*s.* 11*d.*, which, with lighting, heating, furnishing, fence walls, &c., may reach 4,200*l.*

### GENERAL.

**An Art Exhibition** has been opened in Brighton in aid of the building fund of the local science and art school. The collection of paintings is considered to be the most important of all those which have been seen in the town.

**The Exhibition** of the Scottish Society of Water-Colour Painters was opened in Glasgow on Saturday. On the first day thirty-two pictures were sold for 463*l.* 5*s.* The highest price, 65*l.*, was paid for Mr. Francis Powell's *Vessels Becalmed at the Mouth of the Clyde*.

**An Exhibition of Photographs and Photographic Apparatus** will shortly be held in Dublin under the control of the Photographic Society of Ireland.

**The Oldest Church** in America is one supposed to be in the village of Tadousac, which was erected in 1517 by Jacques Cartier. It measures about 20 feet square.

**The Late Mr. H. G. Bohn's** art collection is now being prepared for sale, but as yet is not open to public inspection.

**Messrs. H. Young & Co.** have completed the casting of the bust of the late Archbishop Tait, by Signor Raggi. It is to be placed in the Edinburgh University.

**The West Hartlepool Improvement Commissioners** have approved plans prepared by Mr. G. G. Hoskins, F.R.I.B.A., for the carrying out of extensive additions to Messrs. J. Backhouse & Co.'s banking premises in Church Street in that town.

**The Belfast Central Railway** is announced for sale. The original cost was 700,000*l.*, and the price now asked is 250,000*l.*

**Dr. Kayser**, of Berlin, has succeeded in photographing a flash of lightning. When the photograph was magnified four times, it could be seen that the flash consisted of four distinct parallel streams, the thickest of which looked like scales placed horizontally. Between the first and second streams were alternate bright and dark stripes. The second and third streams were very close together, while there was a greater distance between the third and fourth.

**Mr. Vanderbilt** has made a donation of 500,000 dollars to the College of Physicians and Surgeons in New York, to be used as a building fund.

**Mr. Albert Vickers**, of Somerset Chambers, 151 Strand, London, is preparing the design for St. Mary's New Church (Roman Catholic) at Leek, Staffordshire, for the Rev. Alfred M. Sperling.

**The Redruth School Board** have accepted the design of Mr. John Robert Nichols, architect (of the firm of Messrs. Geo. Berry Nichols & Sons), 59 Colmore Row, Birmingham, and 54 Queen Victoria Street, London, E.C., for new schools at Trewirgie.

**Incorporation of Mary's Chapel, Edinburgh.**—At the annual meeting of this ancient incorporation held on Monday, Mr. George James Beattie, builder, was re-elected Deacon of the Masons, and Mr. Robert Paterson, architect, was re-elected Deacon of the Wrights. Mr. John White, plumber, was at the same time elected treasurer, and Messrs. Macandrew and Blair, C.A., conjoint clerks to the Incorporation.

**Building** is still going on in an extensive manner both in the town of Königsberg and in the provinces. Government buildings, and particularly barracks and buildings in connection with military affairs, are being carried out all over the province, particularly towards the Russian frontiers, where accommodation for large numbers of troops are erected in all directions.

**Mr. T. Smith Woolley** will deliver an address, as President of the Surveyors' Institution, at the opening meeting of the session on November 10.

**The Reading-room** at the Vatican Library is now open to students. No document later than 1815 can be examined. All notes or extracts must be shown to the librarian before leaving.

**The Visitors to the Health Exhibition** are likely to exceed 4,000,000 in number before the closing on the 31st inst. At the end of last week there was a total of 3,737,720.

**A Circular Pulpit**, in alabaster, to the memory of the late Mr. Edmund Robins, has recently been erected in All Souls Church, St. John's Wood. The work has been admirably executed by Messrs. Farmer & Brindley, from designs of Messrs. Wadmore & Baker.

**Messrs. Craig & Rose**, of Southwark Street, have undertaken the manufacture of Wilkins's Fire-Resisting Composition, which has lately been tested in Edinburgh without showing any failure.

**Messrs. Arch. Smith & Stevens**, of Queen's Road, Battersea, have been instructed to erect, at Colonel Wombwell's residence, Upper Brook Street, Grosvenor Square, a new hydraulic passenger lift, upon Stevens and Major's patent suspended principle.

**Mr. A. E. Dobbs** has issued an abstract of the cost of his litigation with the Grand Junction Waterworks Company. His law costs amounted to 1,497*l.* The company repaid 767*l.* taxed costs. His total expenses amounted to 1,561*l.*, towards which the Corporation of London, Vestries, and District Boards contributed 847*l.*, and other donors made up the total to 1,667*l.*, leaving a balance in hand of 107*l.* Mr. Dobbs claims that he has reduced the rental on which the water companies charged in the metropolis from 35,026,577*l.* to 28,990,289*l.*

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, OCTOBER 25, 1884.

### TENDERS, ETC.

\* \* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

\* \* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—  
"Contract Supplement to THE ARCHITECT."

### COMPETITIONS OPEN.

**BOMBAY.**—Nov. 6.—The Municipal Commissioner of Bombay invites Designs and Estimates for a New Municipal Hall and Offices, which must be sent to his Office by Twelve noon, on Nov. 6. A Premium of 5,000 rs will be given for the Design most approved of by the Commissioner, with the assistance of a Committee of the Corporation; 3,000 rs. for the second, and 2,000 rs. for the third. ## GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent  
consist in the heating surface being greater than any  
other Fire-grate introduced to the public. It is very  
simple in construction, and is made in the form of a Stove,  
the back of which is semicircular in shape, with gills  
behind and smoke-nozzle on top, all cast in one piece.  
The same can be attached to any design of a Register or  
Stove front. It is very suitable for schools, class-rooms,  
waiting-rooms, hospitals, offices, dormitories, and dwelling-  
houses, from the cottage to the mansion. Design and  
specification post free on application.

**TESTIMONIALS.**

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"SIR,—I have much pleasure in testifying to the  
efficiency of your patent Warm-Air Fire Grate. It has  
been very successful, and given every satisfaction where I  
have used it.

"Yours, &c.

"JAMES WEIR, F.R.I.B.A.

"To Mr. Grundy."

"Baptist Chapel, Clapham Common, London. Richard  
Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the  
excellency and efficiency of your patent Fire-Grate. It is  
the most charming invention for heating a large room I  
have ever known. I shall have pleasure in showing it to  
anyone who wish to have their schools or rooms pleasantly  
and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,  
July 1884.

"DEAR SIR,—I have very great pleasure in stating that  
the first stove, or patent warm-air ventilating fire grate,  
adopted by me in school at Seaton, and a second in a  
Cocoa Palace, have given such satisfaction that I now  
order eleven to be inserted in New Upper Grade Schools in  
course of erection at West Hartlepool. They are the most  
economical, efficient, and easily managed stove at present  
before the public.

"Mr. John Grundy."

# The Architect.

## THE PROGRESS OF THE INSTITUTE OF ARCHITECTS.

ANOTHER Session of the Royal Institute of British Architects opens next Monday evening, when, there is no doubt, the President will be able to describe, from the point of view appropriate to the chair, a sufficiently prosperous state of affairs. Without professing, or even desiring, to assume a different standpoint, it may possibly be interesting to some of our readers if we survey the prospect independently, taking our facts, of course, from the official records.

The Institute is now just half a century old. Its lists of membership show 412 Fellows or professional full members; 694 Associates or professional members of the second class; 14 Honorary Fellows (the old-fashioned title), and 103 Honorary Associates (the new-fashioned), both of these categories representing amateurs and friends of the profession, many of whom are men of high standing, whether in society, in political life, in art, or in science; 50 Honorary Corresponding Members, eminent foreign architects, belonging to all the principal countries throughout the world; and 3 Honorary Members, differing from the Honorary Fellows and Honorary Associates only in name.

Of the 1,106 professional members, 6 reside in Berkshire, 2 in Buckinghamshire, 4 in Cambridgeshire, 2 in Cheshire, 2 in Cornwall, 5 in Cumberland, 6 in Derbyshire, 10 in Devonshire, 1 in Dorset, 4 in Durham, 3 in Essex, 13 in Gloucestershire, 11 in Hampshire, 3 in Herefordshire, 1 in Hertfordshire, 10 in Kent, 56 in Lancashire (15 Fellows and 17 Associates in Manchester, and 10 Fellows and 2 Associates in Liverpool), 10 in Leicestershire, 4 in Lincolnshire, 8 in Norfolk, 9 in Northamptonshire, 13 in Northumberland, 7 in Nottinghamshire, 4 in Oxfordshire, 3 in Shropshire, 5 in Somerset (Bath), 7 in Staffordshire, 6 in Suffolk, 7 in Surrey, 18 in Sussex, 17 in Warwickshire (in Birmingham chiefly), 2 in Westmoreland, 4 in Wilts, 3 in Worcestershire, 32 in Yorkshire, 703 (240 Fellows and 463 Associates) in London and the neighbourhood, 6 in Ireland, 8 in India, 50 in the Colonies and elsewhere abroad (13 in Australia, 7 at the Cape, 3 in China, 1 in Japan, 10 in New Zealand, 2 in Canada, 2 in Chicago, and 1 in Egypt), 6 in Edinburgh, 20 in Glasgow, 6 in other towns of Scotland, 6 in Cardiff, and 3 elsewhere in Wales.

The patrons of the Institute are the QUEEN and the PRINCE OF WALES; and amongst the Honorary Members of the three (equal) classes there are their Royal Highnesses of EDINBURGH and CONNAUGHT; the Dukes of WESTMINSTER, ABERCORN, and DEVONSHIRE; the Marquis of RIPON; the Earls of DUFFERIN, CARNARVON, DARTMOUTH, POWIS, and WEMYSS; Lords CREWE, HOUGHTON, DE LISLE AND DUDLEY, and SEATON; Count GLEICHEN; SIRS A. H. LAYARD, H. BESSEMER, P. CUNLIFFE-OWEN, J. HANNEN, J. MCGAREL-HOGG, R. WALLACE, W. E. WELBY-GREGORY, W. W. WYNN, and W. R. FARQUHAR; the Deans of St. Paul's, Worcester, and Norwich; the Royal Academicians LEIGHTON, ALMA-TADEMA, ARMITAGE, CALDERON, MARKS, MARSHALL, MILLAIS, POYNTER, WOOLNER, ORCHARDSON, and RICHMOND; the eminent engineers ABERNETHY, BARLOW, BATEMAN, FOWLER, HARTLEY, and HAWKSHAW; with many other equally distinguished persons, such as MESSRS. BERESFORD-HOPE, RUSKIN, GAMBIER-PARRY, W. H. SMITH, CAVENDISH-BENTINCK, NOEL, and the Hon. C. GORE.

Of the thirty-seven eminent architects and architectural writers, English and foreign, whose names constitute the very honourable list of the Royal Gold Medallists, from 1848 till the present time, beginning with COCKERELL, CANINA, and Sir C. BARRY, all are now dead but eleven, namely, Professor DONALDSON (1851), Sir A. H. LAYARD (1868), Mr. FERGUSON (1871), Herr SCHMIDT, of Vienna (1872), Messrs. CHARLES BARRY and WATERHOUSE (1877 and 1878), the Marquis de VOGÜÉ (1879) and Messrs. PEARSON, G. GODWIN,

PENROSE, and BUTTERFIELD since. Amongst "the majority" there are CANINA, VON KLENZE, HITTORFF, STÜLER, LESEUER, VIOLLET-LE-DUC, TEXIER, LEPSIUS, VON FERSTEL, COCKERELL, BARRY, the two SMIRKES, TITE, OWEN JONES, SCOTT, PENNETHORNE, DIGBY WYATT, STREET, and SHARPE.

A list of the "Architectural Bodies in the United Kingdom" may fairly be regarded as a record of the more direct allies of the Institute; and it is satisfactory in this view of the case to find that there are Architectural "Societies" belonging to Glasgow, Berkshire, Exeter, Leeds, Leicester, Lincoln, Liverpool, and Manchester; an "Institute" in Glasgow; a "Royal Institute" in Dublin; and "Associations" (all presumably junior) in London, Edinburgh, Glasgow, Birmingham, Manchester, Newcastle, and Nottingham. In this ample statement it seems, however, a pity to omit the Fabs, Scots, Picts, Nomads, and other minor clubs, which all have their value; the once-promising "Alliance" we suppose has finally gone, years back, to the place where the good alliances go; while "The Society of Architects," which was founded the other day at Exeter Hall, has not probably made good its footing yet as a necessary of professional life.

It is almost superfluous to make the remark that a professional organisation such as is constituted by the general scheme, taken as a whole, which we have above described, is one that ought to be making its mark upon the art and science of architecture, the public character of architects, and the building administration of the country at large and its dependencies. The growth of the Institute during the last few years has been thus rapid, because the growth of the profession of which it is the supreme Guild has been still more so. The late Sir W. TITE used to say that in his early days (shortly after the close of the great French wars) he could have counted all the architects of recognised standing in London, if not indeed in England, upon his fingers. Compare this with the present state of things. There are now living about 80 Fellows of the Institute in London alone, who had attained to the high rank of past members of the Council before the questionable reforms of 1877 which practically prevented the list from being continued—to the great injury of rising men—by making the Council a sort of permanent body for the benefit of a few. The seven years since that time would doubtless have added at least 30 more of equal merit; and it is not too much to say that these 110, as architects of recognised status now at work in the metropolis alone, might be doubled in number, if not trebled, before anything like a limit could be assigned to the class of London practitioners who may fairly be designated architects of satisfactory skill and experience. Then, when we come to add the provincial men, although it is not easy to say how many of these there are by name, it is not so difficult to proceed upon the fact that, amongst the Fellows of the Institute alone, the provincials, in spite of all impediments to membership, tell up to about two-thirds the number of the metropolitans. We may safely guess, therefore, that there cannot be fewer in all than four or five hundred practising architects in the United Kingdom to correspond with the long or short dozen whom Sir W. TITE recognised as persons of a little importance sixty years ago.

To take another test, let us look at the number of designs of merit which are nowadays delivered in a favourite competition, and compare with them the number which, sixty years ago, would have displayed equal pretensions. Consider, again, the increasing multitude of young men who are coming forward to serve the public in a condition of culture as regards design which is astonishing to their elders. What is to become of them is a question which is not before us; we have not hesitated on former occasions to indicate more than one line of collateral practice in which they may probably advance the honour of England quite as well as in purely architectural business; but, at any rate, every consideration of this kind only magnifies the more the importance which professional architecture, in its three branches of art, science, and administration, is steadily acquiring, and the corresponding importance, therefore, which attaches to the public body which is the supreme authorised Guild of British Architects.

The question which arises in most minds upon a contemplation of all this is one that is not easily answered:—How is that dignity to be maintained which is becoming more and more essential to a Guild of such increasing importance? Obviously it is the dignity of the professional members of such a body which alone is here concerned; for the auxiliary aid of outside sympathisers, however cordially it may be bestowed,

is at the best a superficial and factitious adornment, under which the thews and sinews of the organic reality must be either alive or dead.

There are two elements of growth which here come into view; they may be roughly designated Quantity and Quality. That they cannot very well progress together is easily seen; the increase of numbers necessarily lowers the average of intellectual value, whilst the improvement of the standard of merit, just as certainly, must work by means of exclusiveness, to the inevitable sacrifice of the advantages which are to be derived from numerical extension. It is natural, therefore, that in these days of ours, when in all things there is a certain conservatism in favour of quality of one sort or another, opposed to a certain liberalism which takes upon trust the maxim that in quantity, breadth, freedom, and so on, the greatest good of the greatest number, we have Heaven's first law of public prosperity, there should be in the case before us a little of the same mutual suspicion between quantity and quality that there is everywhere else. The list of membership in the Institute has been, indeed, so largely and so rapidly increased of late years that it would be idle to deny the deterioration of professional status which in many cases is discernible as the direct result. On the other hand, the fact that the increase of number, taken upon the lines now accepted, has a good deal farther to go in London, and farther still in the provinces, seems reasonably enough to induce the Management to press forward with continued earnestness in the direction of extension. The recently established examination for Associates is a reaction in favour of quality, but it as yet only on its trial; there are enthusiasts who would examine Fellows also; possibly there may be some who would examine Honorary Members, and "plough" a Duke. Time alone can show the effect of such measures as an interruption of natural development. For our own part we are not sure but that the general opinion of the day would prescribe for such an institution the acquisition of unlimited quantity first as a necessity, and the earnest cultivation of quality afterwards as a luxury.

#### MR. ERNEST GEORGE'S EXHIBITION.

IN his article on "Etchings on the Mosel" which appeared in *The Architect* eleven years ago, Mr. RUSKIN described the characteristics of Mr. ERNEST GEORGE'S style of draughtsmanship in words which are no less applicable to the collection of water-colours that may now be seen in New Bond Street. "I call Mr. GEORGE'S work precious," Mr. RUSKIN said, "chiefly because it indicates an intense perception of points of character in architecture, and a sincere enjoyment of them for their own sake. His drawings are not accumulative of material for future use; still less are they vain exhibitions of his own skill. He draws the scene in all its true relations, because it delights him, and he perceives what is permanently and altogether characteristic in it. As opposed to such frank and joyful work, most modern architectural drawings are mere diagrams or exercise. I call them precious, in the second place, because they show very great powers of true composition. All their subjects are made delightful more by skill of arrangement than by any dexterities of execution. . . . Mr. GEORGE'S work is precious, lastly, in its fine sense of serene light and shade as opposed to the coruscations and horrors of common modern attempts in that direction." An intelligent visitor to the gallery of the Fine Arts Society can hardly fail to recognise the truth of Mr. RUSKIN'S criticism, although he might not be able to express his judgment with so much subtlety.

It is not going too far to say that very few exhibitions are more deserving of attentive study from architects than this one of Mr. GEORGE'S. In the first place the subjects are all interesting. There are two hundred and eighty-six drawings, which represent some of the most picturesque buildings in France, Italy, Germany, Switzerland, Spain, Belgium, and Holland. We have also a few from Scotland. The buildings selected are not unknown even to untravelled students, but they seem to obtain a fresh charm in Mr. GEORGE'S representations. Sometimes they are taken from new points of view, sometimes we are made to see them under conditions of light and shade which may not be apparent to all eyes. But with all the freshness of treatment, there is no straining after effect. Pictures of every kind are generally produced with a view to impressing a spectator. Mr. GEORGE'S sketches appear

to have been made for the satisfaction of the artist. We have heard that they were lying in portfolios and drawers, some being almost forgotten, when it was suggested that they might with advantage be shown in public. The style alone indicates that the author was free from thoughts of purchasers and critics.

In Mr. RUSKIN'S eyes it would seem to be a virtue when an architect's drawings "are not accumulative of material for future use." But in spite of our respect for the critic, we doubt his competency to determine that end. An architect's sketches are aids to his memory, and no one but himself can tell to what extent they will be useful. Critics who test Mr. GEORGE'S work by a comparison with photographs or laboured drawings, overlook the primary purpose of the sketches. They are not so much records of detail as of the impressions which buildings make on a mind at a time when it is most susceptible, and they would be successful in proportion to their power to recall those impressions. The public may admire the sketches, but they can never affect a stranger in the same way as they do the author. M. ZOLA, in writing of pictures, says that "une œuvre d'art est un coin de la création vu à travers un tempérament." Regarded in this way, a sketch bears some analogy to a lyric in expressing the feeling that was predominant at some particular time; and the success of Mr. GEORGE'S drawings may, consequently, be attributed not entirely to his skill as a draughtsman. It is plain that the buildings which he has drawn are not the most remarkable which he has seen in his travels but those only which gave him most delight. Mr. GEORGE could hardly have done so well if he visited the places in fulfilment of a commission from publishers or dealers. His drawings are holiday work, hence, as Mr. PHENÉ SPIERS says (and few men are better qualified to give an opinion on sketching), "in this fact possibly lies the secret of their freshness and brilliance, which seems to partake of the overflowing spirits, the joyous delight of a boy fresh from school." It is owing to the same cause that we find so much unity of character in each of the sketches. There is nothing to indicate that the author was tired before his work was completed, and that a part had to be passed over. Every drawing appears to have been struck off without any variation of mood, and as if the author's aim was to express his first impression.

The quality that Mr. GEORGE appears to admire most is what is called picturesqueness, but which is so difficult to define that Sir JOSHUA REYNOLDS could only say it was something accidental. He has none of those wonderfully regular buildings which appear to be as much determined by rule as an apothecary's prescription. In Paris he prefers the Church of St.-Germain l'Auxerrois to the stately Louvre which confronts it, and in Edinburgh the New Town is neglected for the Canongate. We are afraid that Mr. GEORGE is not a stickler for purity of style when he is on a sketching tour, and it is evident he is attracted by back streets and out-of-the-way places. So long as a subject is attractive he is indifferent as to whether it forms one of the lions of the Grand Tours which are now organised by Messrs. Cook, is entered in "Murray," or has been approved by PROUT. Owing to the general excellence of the collection it is difficult to single out drawings for notice. The château and bridge at Amboise, the views in Dinan, Dieppe, Orleans and St. Malo, the whole of the Spanish and Venetian sketches, should not be passed over, however short may be the time available for a visit to the gallery. There is not one of the drawings which will not repay study, and it is satisfactory to find that the number sold is a good test of the appreciation of the public. It should be remembered that in this country buildings are less often selected for representation than they deserve. Few of our painters have been at pains to study architecture, and they are satisfied when they possess sufficient skill to depict a part of a building in a background. It is otherwise in France and Germany. An ordinary English gallery is therefore very often deficient in one important department of art, but happily drawings like those by Mr. GEORGE testify that there is skill in this country to fill the void.

**The New Railway Station at Bruges**, so long an eyesore to all tourists passing through that city, is at last to be completed. The walls that closed it in at either end have been pulled down, owing to their foundations having sunk, and after the station has been lengthened their place will be taken by some well designed iron trellis-work, glazed.

## COWL TESTING.

ABOUT six years ago the Sanitary Institute of Great Britain appointed a committee to test the comparative merits of the different ventilating cowls in the market. The labours of the members do not appear to have been productive. As far as we can understand, the net result is that the committee are able to say that they now possess trustworthy anemometers, and are at last in a position to proceed with the tests. If six years have been needed merely to ascertain the correctness of the instruments to be used, we may ask how long a period will be required to complete the actual experiments? Should corresponding energy be exhibited, we may fix the time at about seventy-two years. There is no exaggeration in assuming so long a term. We have only to allow, say a month for testing the instruments, which is a reasonable time, and twelve months to test the ventilators, which is also a reasonable allowance, for no tests could lay claim to be considered either complete or conclusive unless made under all the varying conditions of the four seasons of the year. It is well known that one ventilator will act better under certain conditions than another and *vice versa*.

But, after all, what is the value of the investigation? Is it anything more than that a number of gentlemen (some being of the amateurish kind) have got a notion that they will materially aid the cause of sanitary science, and confer a benefit upon the cowl-using section of the public, if they can demonstrate, to their own satisfaction, that some tradesman or other sells a better cowl than his rivals? If the conclusions arrived at after so vast an expenditure of time could be taken seriously by the public, it would probably involve a great loss to the unlucky wights whose cowls had failed to satisfy the committee. As a consequence some dozens of energetic and able men, who are manufacturers of cowls, and who at present are doing more real service to the cause of sanitary science than could be attained by the pottering of amateurs in the course of a century, would be driven out of the field.

There is, however, not much danger of so undesirable an event. The public have already shown by their indifference to the "Kew experiments" that they know the difference between perfect and partial testing, and are aware of the difficulty which attends all attempts to solve the problem. Let us for a moment see how much is involved in the task which a self-appointed committee have undertaken so lightly. Presuming that the tests were intended to fulfil the object in view, it would be absolutely necessary that they should extend over a period of at least twelve months, in order that the cowls might be tried under all conditions of the weather. It is well known to those acquainted with the subject that there are what may be called fair-weather cowls. It would be obviously unfair to test a cowl which is at its best in summer and autumn, but is less efficient in cold and stormy weather, against one which was devised to contend with the most trying atmospheric conditions. To be equitable, a test should be conducted throughout an entire year. But how can we expect a body of gentlemen to devote so long a time, on purely philanthropic grounds, to make the continuous, careful, and elaborate tests and calculations which would be necessary to insure correctness in the final results, and without which their conclusions would be of no practical value? It is also well known that position has much to do with the efficiency of a cowl. It has been often found that a ventilator which acted indifferently in one situation, when removed to another worked well; whilst another ventilator which was found to fail in many situations, when applied to the first building answered admirably, the existing conditions evidently being favourable for its action. The same thing is found in applying cowls to smoky chimneys. What cures one chimney will not cure another, the conditions necessary for success being either absent or present, as the case may be. It is a very common experience among builders that, where several cowls have been tried on a chimney without success, a cowl which elsewhere was found to be worthless exactly meets the requirements of the case. It is just the same with ventilating cowls. It follows that, if adequate tests are applied to cowls, it would be necessary in the first instance to ascertain in what situations they act best or otherwise, and test each of them in those places. This would entail an enormous amount of labour and expense, but it would be absolutely necessary if the tests were to be considered as fair and binding. If cowls were all tried in one situation only, the cowl for which that situation happens to be

most favourable will of course show the best results, although under ordinary conditions it might be one of the worst.

Then the construction of a cowl has a great deal to do with the draught in the shaft when tested. Thus, for instance, a cowl which is pretty open offers less obstruction to any pressure of air applied to the bottom of the shaft. When there is but little wind outside, we may find a very fair draught in the shaft. In the case of an open pipe tried at Kew, where, owing to the peculiar arrangements of the inlet, a strong pressure was applied to the bottom of the pipe, and there being no obstruction on the top at all, the air of course passed up with considerable velocity. But it was owing to no arrangement or action of the wind upon the top of the pipe that the current was created. It was merely the pressure underneath which, when removed, renders the open pipe nothing more nor less than what the open pipe always was and is found to be when applied practically for ventilation—that is, a channel through which the cold air pours down upon the heads of those who are unfortunate enough to be underneath. Cowls less open, and therefore not so susceptible to internal pressure, may be found to act considerably better when the wind is blowing than those which seemingly act well in calm weather, but when tested in blowy weather do not act so well. There is another point of extreme importance. All tests should be open to the inspection of the public and the patentees of the cowls, so that they may be enabled to judge of the pressure as well as of the correctness of the tests. When private interests are at stake secret transactions are always liable to suspicion. Where everything is fair and above board there should be no fearing or shirking public examinations. The Kew experiments, besides doing an immense amount of harm at the time to the cause of sanitary science, by bringing it into ridicule, have so shaken the confidence of the public with respect to the value of testing, that, even if it were possible for any future experiments of the kind to be correct, they would gain no credence. The world is not likely to forget the verdict of the *Times* on the recreations of the Kew philosophers:—"The method of testing was incorrect, and therefore the tests are valueless. . . . Neither in the case of either of the cowls nor the tubes was their true value as extractors ascertained." As the days of the revolving ventilators are practically numbered, it would only be a waste of time, and do an injury to the cause, if any were included in the tests. Even if some may be found to act very well under favourable conditions, they are in general untrustworthy, as they soon wear down, are always getting out of order, and acting the wrong way to that intended; make a disagreeable noise, and altogether become objectionable. They are, besides, not susceptible to ornamental treatment, like fixed ventilators, without materially interfering with their action. No practical man would ever think of placing a revolving cowl in the first rank of ventilators, as even an inferior form of fixed ventilator would be of more practical value in the long run.

If any of the gentlemen who were concerned with the abortive experiments at Kew, which have excited so much ridicule, are engaged in the proposed experiments, we may anticipate a similar fiasco. The position of the members should be above suspicion, and it would, for instance, be unfair to allow a sanitary engineer and patentee to act as a judge on the appliances of a rival, whose theories on the subject were at total variance with his own. Another argument against any of those who formed the first testing committee acting on the present would be that these gentlemen, having arrived at certain conclusions, have stoutly maintained their correctness, and have persistently adhered to them. It is only natural that they should conduct the proposed tests with preconceived and fixed notions and a strong bias. The scientific incapacity which was displayed during the first tests is not a recommendation for the reappointment of the committee. Their conclusions and decision having been pronounced by the press, the public, and the Sanitary Institute to be incorrect and valueless, and that further tests were therefore necessary, it would certainly be the height of absurdity to constitute any of the members of that committee (who may now be said to be on their trial) as judges on their own case. It is also to be hoped that the tests now said to be going on are not being conducted again at Kew, as a more unsuitable building for the purpose than the one used there could not be found. It is an ordinary wooden shed, surrounded on three sides with trees, which create a "swirl" and an eddy all round the building. The situation alone of this shed would be sufficient to render any tests made in it valueless.

There are at the present time some hundreds of ventilating cowls in the market, of which about a score are prominently before the public. It will, of course, be necessary to test every one of these cowls if the experiments are to be accepted as conclusive. If only a few ventilators are subjected to experiments, the tests will fail in proving anything more than that one of say half a dozen cowls was better than the other five, but would not prove that either it or any of the five were better than the infinitely larger number of cowls that were not tested. It would seem from the proposed arrangements that the committee were of opinion that there was an end to invention. After all the labour and expenditure of valuable time the conclusions may be set aside by the introduction into the market of new and improved ventilators, all claiming to be better than the crowned cowl of the committee. Who is to prove that they are not so, inasmuch as they were not amongst those tested? Are the philosophers to get up a fresh series to settle the pretensions of the new claimants, and are they willing to renew those experiments as often as fresh cowls are brought out, say at the rate of two or three every week, as is the case at the present time? Do they suppose also that the defeated cowl-makers would not immediately set to work and make alterations in their cowls which would render the tests made utterly useless and futile, as they could and would not apply to the improvements? These are questions which may not have hitherto presented themselves to the friends of the experimentalists.

### THE ARCHITECTURAL ASSOCIATION.

THE first ordinary sessional meeting of the Association was held on Friday evening, the 24th ult., Mr. Cole A. Adams, president, in the chair.

MR. H. D. APPLETON, hon. secretary, announced that the President had been invited by the Committee of the American International Exhibition to be held in London in 1886, to join the Committee of Welcome.

The various reports of the classes and the balance-sheet for the past session were then submitted and approved of.

#### The President's Address.

THE PRESIDENT then delivered the following address:—Once more devolves upon me the duty of delivering the opening address of a new session, and I cannot but feel sensible of the great responsibilities that this implies. What I have to say must have some little influence for good or evil in the professional career which has opened to many of you, and the sense of this must needs weigh somewhat heavily upon a man placed as I am, especially if he bears in mind that this annual opening address is but one part of his work, and that through the whole session his efforts to fulfil the duties of president must be unceasing and untiring. In conferring this office—the highest in your power to bestow—you have a perfect right to demand the utmost that it is in the power of him whom you have selected to give in return. That you have generously appreciated my efforts during the past session to serve you to the best of my ability, I thankfully believe, from the fact that I again hold the important office of president. Let me here publicly express my gratitude to you for this mark of your esteem, and assure you how highly it is valued, and that what more I can do now and in the future shall be done, with what ability, health, and strength I may have. So much, personally; I could not leave it unsaid before passing to more important things.

Those who were present on the corresponding night to this last session will perhaps remember that we considered the various statistics furnished us by the Brown Book, which, *en passant*, I rejoice to see, has returned to its true colour this session. These statistics were not so encouraging as could have been wished, nor are those now before you this new year. It will be well as briefly as possible to consider the facts just presented to us. In the elementary class of design there is a falling off of sixty-eight attendances and seventy designs submitted; on the average, eight less attendances, nine less designs submitted. The class of design is, however, encouraging—forty-four more attendances, fifty-four more designs submitted; on the average, five more attendances, seven more designs submitted. Again, in the colour decoration class, progress has been made. Last session no statistics were forthcoming. Comparing this one with that of 1881–82, we find thirteen more attendances, seven more sketches; on the average, three more attendances, two more sketches. Turning to the class for study of planning and specification writing, seventeen more attendances, eleven more sets sent in; on the average, three more attendances, two more sets sent in. Class of construction and practice, thirty-four less attendances, eighty-one less papers; on the average five less attendances, ten less papers. Advanced class of construction, seven less attendances; but on the average two more than the previous session. The surveying class shows a

decrease of five members below the two previous sessions. The lectures in connection with classes of design gain by two attendances, those for construction by twelve, on the average one. The library report shows a falling off of nine in the number of readers. You will see, therefore, that though the annual report is right in pointing to "some advancement in the work of the Architectural Association, and some improvements in those respects, which were referred to as being unsatisfactory, especially in the case of the colour class," still it is not so great as we all hoped and expected, especially if you consider the large increase of members. The falling off in the elementary class of design is very noticeable, but some consolation may be gathered from the encouraging increase in the class of design, and Mr. Stannus, the president of this class last session, must be congratulated on this fact. The colour decoration class has, I rejoice to see, shown fresh signs of life and vigour. There is also an encouraging improvement in the class for study of planning and specification writing.

Then we are met face to face with a very serious falling away in the Class of Construction and Practice, and that for the Advanced Class of Construction is not much better. Referring to the latter, the report of the secretaries, points out that six out of the eight meetings advertised were held, four out of seven papers promised were read, and these were by members who contributed the previous session; but it should be noted that the average of attendances was higher. Lastly, the reports of the teacher of the surveying class and the librarian are not such as could be wished. Taking all the above facts into consideration, I think it will be admitted that the appointment of a special committee "to inquire into and report upon the present system of education as carried on in the various classes and lectures of the Architectural Association, with the object of rendering them, if possible, more efficient, and in other ways considering how the quality of the instruction and work done in the Architectural Association might be raised," has not been undertaken too soon, and that we must one and all devote our energies to finding some means for altering the state of things by taking a new departure. This special committee has not been idle. Their first business consisted in sending out a series of questions for the purpose of eliciting opinions, facts, and suggestions from those considered best acquainted with the working of the Association, and from others competent to advise. The result of this has been a mass of most valuable information, which has been duly tabulated by the honorary secretary of the committee, Mr. Frederick E. Eales, in a very thorough and comprehensive manner. This information has been, so to speak, boiled down, and the essence drafted into a report, which, early this session, will be brought before the special committee, and when passed, laid before the general committee, to undergo further revision. Then the whole result of these deliberations will be presented to you. The gist of the questions issued in the first instance I will briefly summarise, in the hope and expectation that those members who, from inadvertence, were not applied to, and others who have the cause of solid advancement at heart, may be induced to lend their help and forward their views at the very earliest day possible to Mr. Eales, who will, I feel sure, welcome any contributions; despite the further encroachment it may make upon a busy life. Briefly, then, the questions run thus—and I shall restrict my summary to those upon which we most need information, and in any answers you may favour us with, kindly make them in the order in which I put them. The numbers here given agree with the printed paper to which your attention was called. (1) Is the system of education the best one? In what way do you think it can be improved? (2) What are your views of the quality and amount of work done in the classes with which you are best acquainted? (3) What are the points of failure, causes, and means of obviating them? (4) Would it be advisable to reduce the amount of work set down for each class meeting, with a view of making it more thorough? (5) Would you advise any test for admittance to the advanced classes? (6) Is it desirable to limit the period of members attending the elementary classes? (7) How can the advantages of the Association be extended to country members? And, lastly, in No. 9 we asked, "In what other ways do you consider the usefulness of the Association might be extended?"

That last question opens up a wide field, and, like the postscript to a letter, is, perhaps, as important as any of the previous questions. I hope that all those who are in this room to-night, and who feel that they can do something to make our machinery turn out more work and better, will answer to this call, as well as those who may chance to read my address in the professional journals. It is not out of place here to say how very much we are indebted to the editors of these papers for the large amount of space they give us; the compliment is a very high one, and I feel sure I may, as your President, convey our best thanks to these gentlemen for the courtesy extended to us—a proof of the interest felt in our proceedings, and their continued record of them goes to prove that our doings outside these walls are carefully watched by our professional brethren, and an interest taken in our welfare. Were it otherwise, we should not see at meeting after meeting the faces of the reporters now so familiar and so welcome to us. We

owe the press this recognition of their valuable and useful services.

With the exception of the advanced class of construction and practice, and the class for the study of planning and specification writing, all the other classes which meet in this building have this rule, "Each member *must* contribute to the work of the class whenever he attends." A glance at the statistics given in the Brown Book will prove that this rule is not enforced. The attendances during past sessions have largely exceeded the work submitted in the various classes. It would probably be very difficult indeed to enforce a strict observance of this very salutary regulation; the frequent and constant disregard of it is, however, very discouraging, and shows how many drones we have in the hive. What remedies can be devised to meet this difficulty will doubtless form an important subject for discussion in the special committee. The real solution of the difficulty must, after all, remain with the members themselves, and I hope when the next Brown Book is issued we shall see some improvement. To contribute work will materially assist you; do not fear criticism, you may not succeed so well as you could wish, but you will certainly be the gainers by entering boldly into the contest.

Last session a sub-committee was appointed to consider whether the time had not arrived when the Architectural Association should publish the lectures delivered in this room. No action has as yet been taken, although some statistics of probable cost have been collected together. The expense of such an undertaking could not fall, I think, upon the funds of the Association, nor could members expect to be furnished gratis with copies, considering the small annual subscription they now pay. Whether the scheme ever takes definite shape must depend upon your own wish. If a sufficient number of subscribers could be guaranteed the experiment might be made, and I think some index of the feeling of our community might be ascertained if members would be good enough in the course of a week or two to send a post-card to the honorary secretary of the committee, Mr. H. W. Pratt, one of our vice-presidents, stating whether or no you are in favour of the work being undertaken. The cost, if a fair number of subscribers could be got together, would not be very large, and no one will be committed to any subscription who is good enough to comply with this request. This proposition of publishing the lectures is not a new one; but, as we are considering a revision of our work generally, the present seems a fitting time to come to some decision upon this point. One strong argument against the necessity for publishing the lectures is that they are so well reported for nothing in the professional journals. This is so, and most highly should we value this boon; but then, on the other hand, no journal can be expected to publish our papers *in extenso* except when they have less claims upon their space, and, year by year, demands upon that are made from all quarters. Again, it is next to impossible to edit the productions with the exactness which a careful author would wish. When a man sees his composition in print it generally reads differently to him, and needs careful revision and some re-casting. Though the journals give all the time they can to the authors, it frequently happens that the printer's boy has instructions to wait while the proof is corrected, and so it cannot be done with that thoroughness which such work requires, and only practised writers can hurriedly bring their thoughts to bear on the work before them. Another drawback is that the papers are bound up with the other parts of the journal, and are not nearly so handy for reference as they would be bound up separately. It is also urged against the proposed scheme that we should find a difficulty in getting the younger men to contribute papers, if they had to face the ordeal of this special publishing. I think that objection may be dismissed. I believe it would have a contrary effect, and that we should procure even better and more carefully thought-out papers, and that the honour of reading one would be more highly coveted. The publicity which the press gives to our meetings is surely a more trying ordeal than the one proposed. Again, it is urged that the discussion took place among us as students, and that the ideas evolved from a discussion are hardly worth perpetuating. To this it may be replied, that the committee appointed for the editing and publishing of the papers would in the natural course of things have discretionary powers. I have dealt at some length with this question, because I think it is an important one; and before leaving it I will again beg of you to let the committee know what your own views are upon the matter, for the decision rests solely with the members.

The judges of the Essay Prize recorded with satisfaction the success achieved by the recipient of it last Friday week; but the committee of prizes felt themselves compelled to notice how very little interest is felt in essay-writing, and they go the length of suggesting that it should no longer be advertised in the Brown Book. I hope this will not become necessary. I think the fact that students do not care to compete in literary work is a sad and serious one. Let us for a few minutes consider the matter. We claim to be members of a learned profession, and I remember hearing the great amateur architect of St. Albans Abbey say "in another place" that we are such. Whether that gentleman was indulging in a pleasantry or was in sober earnest I cannot guarantee, but I have no reason to doubt his meaning it.

The profession *is* a learned one, and has on its roll of past and present members men highly distinguished in science and art, and in those necessary accomplishments which go to make up an educated gentleman. It should be our desire to fit ourselves for any position in our profession and in society; but to do this we must possess those literary attainments which a learned profession and society demand from those who seek to take up a position in it. To write a good essay is not within the ability of many, but to endeavour to do so is in the power of most. To write an essay at all demands an acquaintance with the subject set down for competition, and this necessitates looking up facts and perusing works on the subject. The necessity for a logical order, careful composition, and neatness of expression and dictum, affords most valuable discipline and teaching, and the result of the sacrifice of time to this pursuit cannot but result in good to the student. One satisfaction will be, that with practice he will find his thoughts will run more naturally to tongue and paper, and assist him largely in addressing meetings, committees, or public bodies, or in writing reports. Again, the pursuit of references must needs open up studies which will be of use in ways little dreamed of at the time, and probably foster a love for reading and research which cannot fail to achieve as a result a cultured mind, which, I take it, is the *raison d'être* of the essay prize. I fancy when the profession was not so crowded as it is at present, and when good draughtsmanship was not so much thought of and practised as it is now, that *bonâ fide* architects had, on the whole, a better right to the distinction of being called "learned." Previously to the Gothic revival, men devoted more time to the literature of the art, and what they learned was more thorough. With the Gothic revival came that improvement in draughtsmanship which has been so marked of late years; but I fear in too many instances the love of this charming occupation has shut out of sight the need for literary studies, and the fascination of being a good sketcher in perspective has been detrimental to that more solid good to the student which comes from measured drawings. It needs no very high order of intellect to be a clever draughtsman, and a too close devotion to this pursuit must debar the student from storing his mind with that knowledge of the literary and scientific part of his profession, without which he cannot hope to hold his own with *savants*, or take that place in his profession, and in society, which should be his lawful ambition. Every year education makes strides, and we can only maintain our position in the world by showing we are worthy to do so; to neglect all efforts at culture, and the scientific side of our work, is simply suicidal. I do not think I have taken an exaggerated view of this question. Believing it to be of the utmost importance, I have made these few remarks; test the soundness of them for yourselves, and take council with those men who are best qualified to direct your studies. Give a little less time to draughtsmanship and making pretty sketches, a little more time to mastering the literature of your profession; go beyond this as opportunity presents, and study literature in other branches, and pleasure and profit will be the result.

In considering how the teaching in our society may be made increasingly useful to the members, the advisability of establishing a class for instruction in taking out quantities will certainly have to be carefully considered. The proposition is no new one; it has been before discussed, but a feeling seems to exist among some members that it is no part of an architect's training. I confess I take an entirely different view, and consider it a very important and useful part. A knowledge of how to take out quantities implies an acquaintance with construction, and those details of the different trades, together with a knowledge of materials, their strength and suitability for the various purposes for which they are required. The care with which quantities must be taken out brings to light and sight what had otherwise escaped notice, and has a distinct tendency to foster that spirit of carefulness and forethought in making drawings, which cannot fail in the long run to be beneficial to the pockets of the client. The value of this knowledge in preparing estimates can hardly be exaggerated; and were this necessary part of our profession more generally known, we should not see those great discrepancies which a glance at the tenders in the professional journals weekly disclose. I am not advocating whether architects should take out their own quantities or not; every man must settle that point for himself. I do not think any rule can be laid down, but it is hardly necessary to point out that, if the requisite knowledge is cultivated and gained, a young practitioner may legitimately swell a small income; and if it is his lot to practise in the provinces, the necessity for this accomplishment will soon present itself. We have in our ranks many gentlemen who practise as quantity surveyors, and I am sanguine that, if a class is started, we should not lack teachers, and I believe it would soon become one of the most popular classes of the Association. If a strongly-supported wish exists that the experiment should be made, I feel sure that the committee, as your representatives, will give the matter the most careful consideration. This, as well as other work in the Association, lies in your own hands mainly, and it is for you to say clearly what your wishes are, so that we may be guided in our judgment by the expression of opinion that is presented to us.

We hear a great deal talked about sanitary science, and I

fear the profession is a little weary of the subject; but it is one we cannot afford to ignore, and it would be a most foolish thing to do so. At the risk of wearying you, and repeating what I have said about this matter on other occasions, I must say a few more words on the subject. Every one almost now who takes a house or intends building one asks the question, "How about the drains?" and when we consider that on whether these are right or wrong depends the health or sickness of the household, the importance of the subject from every point of view is brought before one, and unless, as the professional adviser, an architect can advise and carry out sanitary work in the latest and most approved way, he stands a very fair chance of finding that his income will suffer very materially. So, putting the matter on those selfish grounds alone, the value of the requisite knowledge will be conceded by most. But let us consider it on the highest grounds, that upon our skill depend the lives and well-being to an almost incalculable extent of the inmates of the houses with which we are concerned. Suppose a young architect, in the face of the information now at his disposal, were to disregard it, and leave all the sanitary arrangements of his building to chance, and that shortly after it was occupied illness should occur, perhaps a death, and that inquiry—which in these days would assuredly follow, for doctors are fully alive to the evils resulting from defective sanitary arrangements—should bring to light that these were so badly constructed and arranged in the building we are considering, that the cause of the illness and death could be traced directly to this want of care and skill on the part of the young architect. This is not an unlikely case; it has occurred over and over again, and is too often solely due to culpable neglect. Bring home to your minds the sorrow this must cause in the household, and resolve that the charge of neglect in this respect shall never be laid at your door. In times past no one recognised the full extent of the danger involved in the water-carrying system, until medical science turned its bull's-eye lantern into the dark places of the system, and disclosed what frightful evils might lie hidden in our houses, ruining life, health, and happiness. The principles of house sanitation are now well known, and can be learned with patience and practice. To neglect this branch of the profession is the most foolish policy, and can only end in discomfiture.

Every student should, if he has not done so already, and if it lie in his power, make a point of visiting the sanitary and insaniary houses at the International Health Exhibition, and, purchasing the little pamphlet sold there, go carefully through the two houses and study the arrangements. The scheme of presenting the subject to the eyes of the public in this form was an exceedingly happy one and full of teaching; one of the results will be that the public will look more closely into these matters, an additional reason, if one were needed, that we should be before them, and show by our knowledge of the subject that we recognise its importance, and are prepared to meet the demon of sewer air "armed at all points." If architects are unwise enough to neglect this part of their work, we may look for a large extension of outside specialists who will take from us what legitimately belongs to the profession. We can put a stop to this, by conclusively showing that an architect acquainted with all the details, comforts, and construction of a house is the man best qualified to carry out its sanitary arrangements. Bear in mind, also, that a man conversant with modern sanitary science possesses an investment which has a valuable pecuniary interest attached to it, and his employment upon such work may lead to his securing more of another kind, perhaps more congenial to his tastes; at all events, in these days of competition in every walk of life it is hardly prudent to let any chances slip through our fingers. The study and pursuit of this science is not dull or uninteresting; go into it with thoroughness, and I believe you will find that this is true.

In the criticisms which followed my address last year, some of the speakers considered that I had drawn such a picture of what was necessary for an architect to know, that it left the student no time for recreation. I should be sorry for anyone to think that I was in favour of the student bidding adieu to recreation when he embraced the architectural profession. Experience abundantly shows that the cultivation of the physical with the mental, produces the best "all round" man, and the pursuit of healthy exercises in moderation is a wise course to adopt. A strong and healthy man, with a well cultivated mind, can more readily enjoy and digest knowledge than a weak and unhealthy one, and life is too short for man to be robbed of that precious relaxation from work which healthy natures rejoice in. In setting before a student a high ideal of what his career should be, better service is done him than by throwing dust in his eyes and telling him that he need not trouble himself to excel in the many branches which constitute our profession. He who would hit the target must aim high, and allow for his shot falling lower. An architect's life must be one in which he is always a student, always learning something, if he will but keep his eyes and ears open to receive knowledge. It is not for one moment to be expected, or in any way desired, that a student should set to work with the idea that in a year or so he can master the various branches of his profession; better that he should take up one or more subjects at a time and master those before proceeding to others. It must take more than the usual three years of articles before a student can emerge into the full-blown archi-

tect, and he is wise who, when his articles have expired, still continues to submit to the yoke, and goes on perfecting the knowledge of his work. I have not put forward anything that is impossible or impracticable, nothing that cannot be accomplished with patience and perseverance, and still leave time for that exercise of the body so necessary to preserve a healthy mind.

What is the future of the Architectural Association? It was founded several years ago for the same aims that now exist; but I think if we were carefully to analyse the work done, with the number of members that belonged to it in its earlier years, it would be found that the proportion was a larger one than it is at present. We now number all but one thousand members, and, financially, our balance-sheet shows that the amount to our credit is considerable. But is the proportion of workers, and the amount and quality of the work done, in favourable comparison with past years? We are looked upon as a successful institution, and that very fact carries with it a warning and a danger. Any community in its younger days is simpler in its tastes and pursuits than it is as it approaches maturity, and little by little, if affluence falls to its lot, luxury creeps in, unless the rulers are wise and resist its insidious poison. It is the fashion now in the profession to belong to the Architectural Association—and, in a way, a very good fashion too—but I think I may say, without being accused of sounding the alarm unnecessarily, that there is at the present time a want of that early vigour and earnestness which was, as far as I can learn and judge, present in this body in the years of its infancy. The proportion of workers to the number of members last session I calculated was just about one-fifth; that alone is not a very healthy sign, even making fair deductions for those members who have passed through the classes, and others in practice who still, happily, keep their names on the list. But we want the younger men to come forward, not to be content with being members only, attending the classes and lectures and doing no practical work, but to work in sober earnest, and to contribute that bone and sinew to the Society which shall make it strong, powerful for good, and respected. If students as they join will do this, then the future of the Architectural Association may be a bright and prosperous one, and we may see it grow, year by year, into an institution which shall possess valuable facilities for instruction far beyond what we have at present. The vision of a college where the art and science of architecture shall be taught, and the services of our greatest architects secured for teaching the various branches of the profession, is a vision that has been before our eyes for many a long year; and when one reads the valuable papers contributed by Mr. William H. White, Mr. R. Phené Spiers, and others, on the thorough system of art education as carried on in France and Germany, especially in the former, and learns what great results follow and how highly the profession and its professors are esteemed, one's heart sinks and mourns over the want of system and thoroughness which characterises the education of architects in this country. As Englishmen we should perhaps rebel at the strict academical course of teaching which is adopted abroad; but how much we might learn from it, and how valuable it would be if we could adopt some such system, so that the profession should in this country take the high position it does in France, when the State should recognise the duties it owes to art in the education of the people and the pre-eminent position of the Empire in the eyes of the world, and not, as now, entrust their buildings to the engineers and officials of South Kensington, and maintain an office of salaried architects for carrying out public architectural works, but seek out for employment and counsel those architects who have fairly won their reputation. As a profession we have been much to blame in the past for allowing this state of things to be brought about. The very want of such a system as for something like two hundred years has existed in France, has resulted in want of sympathy and union between the members of the profession, and the profession and the public, which, had it been otherwise, would have given strength, so that we should have compelled recognition in the highest quarters by the right of having conquered difficulties, and have been able to show that men who had studied the art and science of architecture, and won distinction in their profession, were the men to entrust public buildings of importance to. The commercial spirit of this country has too little sympathy with the artist. If we are to succeed in turning out architects highly educated in their profession, we must have better machinery than at present exists. If we were in thorough earnest as a profession in this endeavour, the good might be accomplished; and at a time when the legitimate prey of the architect is being constantly pounced upon by the vultures, the necessity for combination and self-preservation needs but little argument. We in this Association may do much; and in honest rivalry one with another, cultivate the art with ardour, raise it in the eyes of the public, and not rest until it is placed high in the estimation of men, so that they too shall love it and be proud of their public buildings and monuments, and proud, too, of the men who have raised them, so that if the ghost of Sir Henry Cole should rise from the grave, and repeat the question, "What is an architect?" the answer may be taken from the tomb of the great Sir Christopher Wren, and slightly modified be, "If you seek to know, look around."

Mr. ASTON WEBB moved a vote of thanks to the President

for his address. A somewhat melancholy view had been taken by the President, but this was not the first time that remarks had been made from the Presidential chair that the vitality of their Association and the *esprit de corps* of the members was not equal to what it had been in past years. He considered that, in reality, the same amount of interest as ever was taken in their work by the members. He hoped the President, as member of the Council of the Royal Institute of Architects, would not allow the solemn chill of the upper house to interfere with the energy he had displayed downstairs. Architects, he thought, paid quite enough attention nowadays to sanitary science and quantity surveying—they were well up in these matters. Sanitary science had no striking results to show during the last half century, so if they wished to produce good work, students should look to art rather than to science, and, having put before them a high ideal, strive to arrive at that ideal not with mechanical perfection, but with artistic perfection, which could only result from a true love of the art they professed.

Mr. H. L. FLORENCE seconded the vote of thanks. While thoroughly coinciding with the President's views in the main, he said he did not consider the proportion of members who attended the classes was at all unsatisfactory. The members of the Association were very numerous, but the bulk of them were necessarily senior members, and members who had passed through the classes.

Mr. M. B. ADAMS said the President's remarks on the study of sanitary science were not a whit too strong. In the present days of competition, when specialists were coming more and more to the front, an architect who aspired to succeed in the higher branches of his profession ought to go thoroughly into these matters.

Mr. GOTCH wished that a system of education existed that pupils could devote the day-time to study instead of having only such hours as they could snatch from their leisure-time after the day's work was over. The study of literature for an architect was second to no other studies. An architect must needs be a man of culture, and apart from diction and style and that it would enable a man to write an intelligent report, it would teach him to spell correctly. It had been his lot to look over many architects' reports, and it had been painful to see the egregious mis-spellings.

Mr. BRODIE described the present system of pupilage as a crying evil. The premiums were so much money obtained on false pretences. Study of quantity-surveying though not always a part of an architect's work, was necessary if a student wished to be able to write a specification well.

Mr. W. H. ATKIN BERRY, hon. secretary, explained that the suggestion for doing away with essay prizes came only from the committee of one of the classes in their own interest, as they were desirous of offering another prize to their class.

The vote was then put by Mr. WEBB to the meeting, and carried by acclamation.

The PRESIDENT acknowledged the compliment, and, in his reply, observed that he had been received by the Council of the Institute with the greatest courtesy and his opinions listened to with the greatest attention, which proved that the large body of members he represented in the Association exercised a real weight and influence. As to his remarks on their internal affairs, it was his duty to be somewhat melancholy rather than represent everything *couleur de rose*. He wished to stimulate their energies, which would not be done by letting them think there was no room for improvement. As a result to be gained, he proposed that practical men should endeavour to become also artistic, and the artistic, on the other hand, to become also thoroughly practical.

## THE SCOTTISH NATIONAL PORTRAIT GALLERY.

WE learn, says the *Scotsman*, that the Board of Trustees for Manufactures has now completed the purchase of the ground in Queen Street selected as the site of the proposed National Portrait Gallery. Our readers will recollect that some considerable time ago an unknown donor placed at the disposal of the Board, for the establishment of the institution in question, the sum of 10,000*l.*, on condition that from Government or some other source a similar amount should be obtained. An application to the Treasury met with encouraging success, and the Board being thus placed in possession of 20,000*l.* as the nucleus of a portrait gallery fund, the question of providing a local habitation for the proposed collection came next to be considered. Among other schemes that were mooted was a proposal to find accommodation for the Society of Antiquaries in the new wing about to be erected of the Museum of Science and Art, and to appropriate the rooms they presently occupy for the Portrait Gallery. To this arrangement, however, at least in the form which it took, the Antiquaries were found to be strongly opposed; and matters seemed to have come pretty much to a standstill, when the munificent donor of the original 10,000*l.* stepped forward with an additional offer of 20,000*l.* to erect a building in which the national portraits and the Antiquarian Museum should be jointly accommodated. With this

offer there was coupled the proviso that a site for the intended edifice should be provided by Government grant or otherwise, so that the whole 20,000*l.* might be available for building purposes. The Treasury was again approached, with the gratifying result that 7,500*l.* was forthwith promised for the purchase of the necessary ground, and it is, we believe, at this price that the Queen Street site has been acquired.

Situated on the south side of the street, between North St. Andrew Street and North St. David Street, the area in question, which at present lies vacant, has the shape of a regular parallelogram, measuring some 260 feet in length—that is to say, along the line of Queen Street—by about 70 feet in width. It has the advantage of being completely isolated, so that any building erected upon it will be well seen, while less exposed to the risk of fire than if in contact with other property. The situation, too, is desirable, as being easy of access from our principal thoroughfare, and within a few minutes' walk of the School of Art, the National Gallery, and the rooms of the Royal Scottish Academy. The preparation of plans for the proposed structure is now being pushed forward by Dr. Rowand Anderson, architect to the Board of Trustees. From the designer of the New Medical School the public will confidently expect an edifice worthy at once of the site, of the city, and of an important national institution. The design adopted will probably be of such a nature as will enable the Board at once to make ample provision for the present and immediately-prospective requirements both of gallery and museum, while admitting of future extension, or rather completion, in accordance with the original scheme, as necessity demands and resources become available.

Meanwhile, pending the commencement of the permanent building, steps are to be taken without delay for the erection of a temporary structure, on part of the newly-acquired site, in which the portraits at the disposal of the Board, and such others as they may receive on loan, will be exhibited to the public. There have already, as we mentioned the other day, been promised for twelve months about sixty canvases from the Loan Exhibition recently closed. Several desirable portraits that figured in the same collection have been acquired by the Board for the permanent gallery; and it is understood that the Watson collection of prints, in possession of the Board, embraces a considerable number that will be found worth exhibiting. It will be readily understood, however, that if left dependent for its expansion on the funds at the command of the Board, the national collection must necessarily be of very slow growth. The interest of 20,000*l.*, after providing for the maintenance of the gallery, will not go very far in the purchase of valuable paintings. All the more urgent, then, is the call upon patriotic Scotsmen who may be possessed of historical portraits to remember the claims of this great public institution, and upon public bodies to seek here a safe repository for paintings that should be better known than they can ever become in their present quarters.

The prospective removal of the Antiquarian Museum from the Royal Institution will clear the way for a rearrangement of that building that shall give adequate accommodation for the School of Art. At present the work of this school, which was last year attended by about one thousand persons, is sadly hampered for want of space. It was at one time proposed that new rooms should be found for it at the Museum of Science and Art; but this idea has now been abandoned, it being thought desirable that if possible the school should be retained in the near neighbourhood of the National Gallery, the Royal Scottish Academy, and the National Portrait Gallery. With the space now occupied by the Antiquaries at their disposal, the Board should be able to make such arrangements as will secure the comfort of teachers and pupils, and generally promote the efficiency of the institution.

## EMMANUEL COLLEGE, CAMBRIDGE.

THE whole of the windows in the chapel of the above college have recently been filled with stained glass. The style of the work is Classic, and the arrangement consists of rich figure-work panelled, under canopies, with a framework of elaborate detail. Each window contains two figures of men celebrated in history for their great learning and types of scholarly character. They are arranged to commence at the east end, and read thus:—1, Origenes; 2, Jo. Erigena; 3, John Colet; 4, Wm. Tindale; 5, Benjamin Whichcote; 6, Peter Sterry; 7, John Smith; 8, Wm. Law; 9, St. Augustine; 10, St. Anselm; 11, John Fisher; 12, Thos. Cranmer. The landscape behind each figure is, as far as can be ascertained, perfectly correct in detail. The Rev. A. Rose, M.A., Bursar of the college, lent valuable assistance in providing the authorities for this part of the work. Messrs. Heaton, Butler & Bayne, of 14 Garrick Street, Covent Garden, London, designed and executed the work, under the supervision of the architect, Mr. W. A. Blomfield, M.A.

Messrs. Diespeker & Co. have carried out the mosaic floors in chancel and sanctuary at St. Cuthbert's Church, Hunslet,

## NOTES AND COMMENTS.

AN interesting collection of printed books, illuminated manuscripts, engravings, and antiquities, relating to the history and to the artistic life of Antwerp, will be sold in that city on the 4th inst. and following days. The collection represents the labours of four generations of antiquarians, and from their names is known as the VAN DER STRALEN-MOONS-VAN LERIIJS Collection. The catalogue of it has been very carefully compiled by one of the librarians of the city's public library. Among the books to be sold, numbering in all 20,000, are several very rare specimens of the earliest productions of PLANTIN's press. There are also several pictures by RUBENS and other masters.

THE only standards of 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, and 12 inches respectively, which the Standards Department of the Board of Trade has been hitherto provided with, have been certain measures engraved or marked on a bronze bar, which were verified by the Standards Commission in 1870. These latter measures are well adapted for use when the micrometer-microscope may be used in their comparison, their lengths being defined by fine lines engraved on the bar. For much practical work it is, however, necessary to refer to standard measures whose lengths are determined by the distance between the ends of bars, or by contact. Standard end-measures of 12, 6 and 3 inches respectively were transferred to the Standards Department from the Royal Observatory in 1866, but there is no record of the particulars of the verification of these standards, and as they have been found to differ from other standards, it became necessary to obtain and carefully verify a new set of end-standards of the multiples of the inch. A series of new end-standards have been accordingly obtained by the Board of Trade from MESSRS. TROUGHTON & SIMMS and from Sir J. WHITWORTH & CO.

THE Académie des Beaux-Arts in Paris has awarded the prizes which are available for architects in practice. MM. SEVELINGES and MARGOTIN have obtained the 1,500 francs which represent the DESCHAUMES legacy, and M. BLAVETTE the JARY prize. The prize of 1,000 francs, founded by Mme. ESTHER LECLÈRE as a memorial of her brother, was awarded to a design for a provincial museum by M. GEORGES CHADANNE. The important prize established by M. DUC for the encouragement of a high class of architecture has been divided between M. ALBERT BALLU and M. ALFRED VAUDoyer. The Académie proposed a design for *Un établissement thermal d'eaux minérales* for the Grand Prix. The first prize has been carried off by M. D'ESPOUY, a pupil of M. DAUMET. The 'premier second' was awarded to M. DEBRIE, and the 'deuxième second' to M. DEVIENNE.

THE Health Exhibition closed on Thursday after a season which must be considered most successful, if the number of visitors can be taken as a test. Such a result was not anticipated by every one. The death of the Duke of ALBANY, the depression of trade, and other causes were at one time supposed to be likely to be impediments to a prosperous season. It is fortunate that Fate has been propitious, for a failure in one year must influence successive exhibitions. "The Healtheries" has aided in increasing the enjoyment of the public, and for that we are all grateful. But it is not yet plain whether the exhibition has done much to advance sanitary knowledge. The exhibits have not been studied by the majority of visitors, the lectures have not been attended by the public, and the very useful hand-books have not become popular. The gardens, bands, and Chinese Court have been the main attractions, and sanitary appliances have been in reality little more than means to drive the visitors into the grounds. Very many of the exhibitors are not satisfied with the exhibition or with the office they were made to fill, and we shall be surprised if there is not some plain speaking on the arrangements.

WE trust that the authorities of the South Kensington Museum will persuade the Corporation of Bath to make a present to them of the excellent model of the Old Roman Bath. It is undoubtedly the best example of an archæological model that has been prepared in England. It is also a memorial of the perseverance and insight of Major DAVIS, the city architect, who has, under great difficulties, followed out a theory, and at length succeeded in revealing the greatness of the Roman sanitary system in Bath. The model is worth a

dozen lectures on Roman life, and should be placed in some position where it may become an aid to public education. The collection of photographs would also be most useful in a public institution, as illustrations of Bath and the life that was led there.

MR. J. T. WOOD appeals for aid to enable him to continue his excavations on the site of the Temple of Diana at Ephesus. He believes that there were one hundred and eight sculptured drums of columns, from 5 feet 7 inches to 6 feet in diameter. Five only have been recovered. Mr. WOOD considers that the drums would probably be rolled to a certain distance from their original position, and a number of them may still be found at no great distance from the present limits of the excavations. Portions of the sculptured frieze and other parts of the temple might also reward research, if subscribers would only furnish the means to pay the labourers.

THE Handbook on the Water-Supply of London, which has been issued in connection with the Health Exhibition, is an amazing shilling's worth. Over two hundred pages of type, several maps and diagrams, form a body of matter that should, from its quantity alone, satisfy the most exigent. But the information is of a kind that is now especially useful. People talk about the defects of the Metropolitan water-supply, but very few are in a position to have mastered the subject. Information upon it has not been readily accessible up to the present. Sir FRANCIS BOLTON, from his office, is able to give all necessary details respecting the sources of supply, the histories of the companies, the methods of filtration, the quality of the water, the cost of works, &c.; and every ratepayer is consequently able to know as much on the subject as any member of the Legislature. Sir FRANCIS BOLTON is of opinion that while the existing supply is fairly satisfactory, it is practicable to introduce many improvements by which waste of water would be preventible. The chief alteration would be the adoption of a system of constant supply. According to the last returns there were only 258,205 houses in the metropolis with such a supply.

THE first report of the Nineteenth Century Art Society shows a fair prospect, considering the difficulties attending ventures of the kind. The operations of the society began in September, 1883, and an exhibition was opened in November of the same year, with a collection of 240 works, contributed by 140 members. This list of members was augmented on the occasion of the society's second exhibition in February, 1884, to 200; and by the third exhibition in May, 1884, the number of members had reached the allowed limits. The three exhibitions have been successful. The number of pictures sold has been 220, being the works of 100 different members—a proportion which has never been arrived at by any existing society; and it is assumed that, but for industrial stagnation, this large proportion of sales would have even been exceeded.

MR. W. M. F. PETRIE was able on Wednesday to give a satisfactory account of his exploration at San (or Zoan), which has been conducted at a very small cost. The area of the district is large, and some of the mounds are 80 feet high; but the whole of the ground has been examined to depths of ten, twenty, or thirty feet, so that there is not a space of more than three hundred yards in any part untouched by excavations, and many districts have been riddled with pits. In some places remains were found that probably went back to before the Egyptian empire, perhaps to the Hyksos period; but in by far the greater part of the workings Greek and Roman remains were met. Twenty years ago M. MARIETTE cleared a part of the site of the temple, and Mr. PETRIE believes that by cleaning and clearing around every accessible block of stone, and by copying every fragment of inscription that can be found, the most complete account has been rendered of any site in Egypt. Among the discoveries outside the ruins of the temple are two large wells of Greek or early Roman age, with staircases leading down to the water, by which the people descended to fill their pitchers. In one house (of the time of AURELIAN, 174 A.D.) was found a glass zodiac, with the heads of the months painted in ochre and the signs laid on in gold foil. This is the only Roman zodiac yet found in Egypt, the only representation of the heads of the months, and the only example of painting on glass found in that country, or, indeed, elsewhere, excepting a vase found in Cyprus. Along with the zodiac was found the only glass lens yet discovered in Egypt. Mr. PETRIE has been examining other sites, and expects to obtain permission from the Egyptian Government to explore them.

## ILLUSTRATIONS.

TOWN AND COUNTRY HOUSES, BY MESSRS. ERNEST GEORGE &amp; PETO.

WE this week illustrate various works now in progress by MESSRS. ERNEST GEORGE & PETO. The houses in Collingham Gardens, Kensington, form a companion group to those by the same architects in Harrington Gardens, which we have previously illustrated. The group of houses will form one of the most exceptional and complete things of the kind which can be found in London; as, when finished, there will be a double row of quaint and gabled houses, with a public garden between them; and outside the entire plot run the streets, thus isolating it from the adjoining houses. The houses are so arranged that they all of them face the public gardens in front across the streets, as well as those in the rear. There will be in all some eighteen houses. The architects having received many applications for the purchase of the houses built in Harrington Gardens, which having been carried out for various clients were not for sale, suggested to Messrs. PETO BROS., the contractors, to take one of the few remaining open sites available to build a similar but more complete scheme as an investment, after the manner of those in Harrington Gardens. Some of the houses will consequently be for sale, others are built for private orders. The house No. 1, a corner building, is long and low, with four gables on the flank wall. The house has four tall bays, one of which forms the porch. The mullions, quoins, and all dressings are of buff terra-cotta, which goes well with the red brick. The material has allowed the architects to use refined mouldings and elaborate "stops," that would have been costly carved in stone. This corner house having three external walls has all the comfort and light of a country house. The rooms are entered from a panelled hall 34 feet long, with a high stone chimney, and with a large bay and other windows. Round the hall are grouped dining-room, morning-room, and drawing-room. An archway leads to the staircase, which works round a square well-hole, with continuous arcaded newel posts. A screen and curtain cover the passage between the back stairs and front door, so that the hall may be used as a place of reception without disturbance from servants crossing it. This house is English in its composition and detail.

On another page we show a pair of houses with a Flemish treatment; they are entirely of red brick, with tracery and mouldings of brickwork. The window frames and casements are of wood with lead lights; here there are no mullions, but each pair of casements opens clear. These houses have stepped gables and dormers and angle brick pilasters running out through the gables. The high roof contains two storeys of rooms lighted by tall dormers in two heights. The court, open to the road on one side, is not to drive into, but it will be paved with mosaic, and arranged with plants in tubs, while it pleasantly lights the hall and stairs of both houses. On entering we find an ante-hall and library of low pitch, then up a few steps is the hall, dining-room, and morning-room, one short flight of stairs bringing us to the drawing-room over the low portion of ground floor. These houses have interesting staircases, panelling, and parquet ceilings, some rooms showing the joists, or with wood panelled ceilings.

Our third page from this group of buildings, though not yet begun, is designed for a client at the other corner of the ground, this again having three external elevations. The building is in terra-cotta, with red brick, and has moulded string-courses and labels, as well as vertical bands or pilasters dividing the windows. The windows, except where mullioned to the staircase and bay windows, have wood frames, transoms, and casements opening in pairs without mullions. After the tall, stepped, and enriched gables, the octagonal staircase turret is the principal feature, containing circular stairs. Another requirement that has been made to give interest to the building is a stage to be used as observatory at the apex of one of the gables. This house may be considered more German or Flemish than English.

An interesting house that we are unable to show in this number is the one built for Mr. HAROLD PETO (ERNEST GEORGE & PETO), in which the owner has carefully studied his own tastes and wants. The house is of red brick, with stone mullions and lead lights, many good bits of old German glass being introduced, as well as a quantity of good old tile-work. The dining-room has a beamed ceiling and an ingle-nook. The walls covered with original sixteenth-century stamped and gilded leather above an oak dado. The hall is panelled, and

has a hooded stone angle chimney up to the low-pitched oak ceiling. The house is roofed with thin stone slabs in the manner of the old Sussex houses, and while it gives a good texture to the roof, it is at the same time an agreeable change from the prevailing red tiles around. There are other houses larger and smaller, and all with a diversity of plan and treatment.

The Knoll, Barton, is being erected for Mr. JOHN WALKER. The ground-floor is of red brick, and the upper storeys are here shown of weather tiling; but since the drawing was made the design has been changed to oak quartering and parquet-work for most of the upper portion. The contractors are MESSRS. MASON & EDWARDS, of Burton-on-Trent.

Lodge and Cottages, Clandon, have just been built for the Earl of ONSLOW. The external quartering, as is always the case when MESSRS. ERNEST GEORGE & PETO use it, is constructed in solid oak, the latter being left with the marks of the tool—adzed, and not sawn or wrought. The upper floor is carried over the road, thus forming a covered gateway to the park. The builder was Mr. SAVAGE, of West Clandon, who carried the work out very satisfactorily.

Littlecroft is a house and studio now building in the New Forest for Mr. MORTON K. PETO. The external quartering is of oak, with parquet filling-in. The slope of the ground is taken advantage of so that an extra room is obtained in the height of the main gable, a boudoir being arranged on the first landing and above the porch. The oak staircase is worked in a square space behind posts and arches, and can be screened by curtains from the hall, which latter is arranged to form an additional room to the house. The studio has an open roof and gallery at one end. The dining-room has an ingle behind an oak arch; overhead the beams are shown, and a ceiling of wood, panelled with mitred mouldings.

## MR. RUSKIN'S LECTURES.

THE second of his series of lectures on the "Pleasures of England" was delivered by Mr. Ruskin, in the lecture-room of the University Museum, Oxford, on Saturday afternoon, the subject being "Edward the Confessor—The Pleasures of Faith." The Professor commenced by observing that he was forced to pass rapidly over the part taken by the Scotch missionaries in the Christianisation of England and Normandy, and he referred them to his published works for detailed accounts of his views on the Ionian mission. In connection with his original proposition in his first lecture of what London might have been if no flowers, trees, and children born at the Thames side had been rightly cultivated, he said that many of his hearers could imagine better than he the look London must have had in the days of Alfred. He exhibited a drawing of a coin of the time of Alfred, which contained the letters of the word London interwoven in a monogram. That coin, he said, was entirely characteristic of the literature of the Empire, each letter being emblematical of the progress of art. The picture was that of Alfred's silver penny, struck in London at the beginning of the beautiful English coinage. They might have lost the idea of what most of the buildings in London were like in Alfred's day, but certainly the groups of shipping were simply superb—small but entirely seaworthy vessels, manned by competent seamen. The ships that then lay at London shore were bright with banner, shield, and dragon. Instead of these we now had the penny steamer, the coal barge, and the wherry full of shop-boys and girls. He dwelt only on the naval aspect of London waters in order to refer them to that wonderful chapter of Dean Stanley's on Westminster Abbey, where they found the origin of the name of London was given as The City of Ships. He (the Professor) had often said to friends who had praised his books that he would rather have written that chapter than any volume of them; but if he had been able to write the historical part of it, the conclusions drawn would have been widely different. The Dean, indeed, described with poet's joy the river of the wells which once rose from those sacred streams which now lay clouded in Holywell and Clerkenwell; but it was only in the spirit of the modern side of Belgravia that he discerned a quaint humour in the fact that the great arteries of our crowded streets, the vast sewers amidst our habitations, were fed by the life-blood of those old and living streams that underneath the Tyburn, Holborn, Fleet, and Walbrook were still pursuing their ceaseless course, still ministering to the good of men, although far differently than when Druids drank of their sacred springs, and Saxons baptised in their rushing waters long ago. Whatever sympathy they might feel with those eloquent expressions of the present, the past, and the future which peculiarly animated Dean Stanley's writings, he (Professor Ruskin) must pray them to observe that the transmutation of holy wells into sewers had, doubtless, destroyed the charm and utility of the

Thames as a salmon stream. They were all of them taught by Lord Macaulay and his school that because they had carpets instead of rushes for their feet, feather beds instead of ferns for their backs, kickshaws instead of beef for eating, and drains instead of holy wells for their drinking, that therefore, they must positively be the cream of creation—every one of them a seven-headed Solomon. They might believe in their present habits and circumstances as they pleased, but do not let them decry the practices of their fathers until they had trod the cold earth bare-footed and seen the heavens face to face, as the latter had done. If they cared to see and know these things for themselves they might do it for little pains. They need not do any great thing, they need not keep one eye open and the other shut over a microscope for ten years, but need simply do, as king after king of the Saxons did—put shoes on their feet and a cloak on their shoulders, and walk to Rome and back, sleep by the roadside when fine; take shelter in an outhouse when wet; and live upon bread and water, an onion or two, and rain; and if the experience they had learned on their return did not deserve the name of spiritual, at all events they would not be disposed to let other people call such proceedings either poetry or fiction. Mr. Ruskin quoted largely from Dean Stanley with regard to the establishment of Westminster Abbey, and, in referring to the character of Edward the Confessor, said that king was in many respects of a childish temperament, but was governed, guided, and inspired by men of the widest and most brilliant faculties, whether constructive or speculative, that the world had then ever seen, or, he believed, had seen since. He read a sample of the philosophy of St. Augustine, a prayer of Alfred's, and a letter of Canute's, and remarked that, whatever they might feel respecting the beauty and wisdom of these compositions, they might be assured above all of one thing—that they were true and sincere. The ideas of diplomacy and priestcraft of recent times—the last three centuries—were wanting. No false knight or lying priest ever prospered, the Professor believed, in any age, but certainly not in the dark ones. He did not say a man did not prosper by wrong-doing, but he did say that he did not prosper by telling lies. We continually heard of the trials, sometimes of the victories, of faith, but scarcely ever of its pleasures; whereas at this time in those dark back ages they would find that the chief delight of all good men was in the goodness and the wisdom of the Master who had come to dwell with their spirits upon earth. In everything that we now did, or now sought, we exposed ourselves to countless misery, shame, and disappointment; because in our doing we depended upon nothing but our own powers, and in seeking chose only our own gratification, and could not for the most part conceive of any work but for our own interests, or the interests of others about whom we were also selfishly interested. We were anxious in the same faithless way for everything about which our passion was excited or our skill was exercised; and the idea of doing anything except for our own praise and glory was narrowed within the precentor's invitation to the company of little voice and less practice to sing to the praise and glory of God. Were any of them willing, simply as a philosophical experiment, in the interests of the greatest of sciences, to adopt the sympathies and feelings of those men for a given time—say for a year? It could not possibly do them any harm, and they could not possibly learn the truth of those things without trying. If, after a year's experience of such life, they found themselves no happier than before, at least they would be able to support their present opinions with more grace and with more modesty. If they would not do this; if they had not the courage nor the heart to break away the fetters of earth, and to take up their sensual bed and walk; if they said they were bound to this one thing and that the interests of their friends, the bias of their genius, the bent of their energies, and all the rest of the bow-wow of the wild-dog world must be attended to whether they liked it or not, then at least let them give up talking about being free and independent creatures—let them recognise themselves as slaves. Then at least also, for shame, if they would not believe there were men who gave themselves to God, let them know and confess how surely there were those who sold themselves to His adversaries. The subject of the next lecture is, The Confessor to Cœur de Lion—"The Pleasures of Deed."

### THE ROSSETTI MEMORIAL WINDOW.

THE memorial window for Birchington Church, which he was asked to undertake by the mother of the late D. G. Rossetti, has been completed by Mr. F. G. Shields. The design, "Christ at the House of Simon the Pharisee," by Rossetti himself, was first adapted for one of the two lights, but this was disallowed by the custodian of the church on the ground that the incident was not in Scripture. Another design of Rossetti's has therefore been chosen—"The Passover." The second light is designed by Mr. Shields, and it balances with his late friend's rearranged work. The glass is admirably executed by Messrs. Heaton, Butler & Bayne. The following description of the subject is by Mr. Shields himself:—"The Passover. The boy Saviour, clad in red, holds a brazen bowl, with the blood of passover lamb, and stands on the

threshold of the Nazareth home, leaning against its door-post. Zacharias, father of John Baptist, with a sprig of hyssop sprinkles the lintel. The young Baptist kneeling at the feet of Jesus loosens His shoe's latchet. The Virgin gathers bitter herbs—wild succory—and more distant Joseph, with the slain lamb upon his shoulder, proceeds with the aged Elisabeth to roast it with fire. In a field beyond another lamb draws suck from its mother ewe. Within the house, under the spreading vine leaves that cover the outer wall of the lowly home, is seen the spread table with a skin of wine and cup upon it, and a plate with unleavened bread. In the foreground, a well; around it the forget-me-not clusters. Inscription—"Christ our Passover is sacrificed for us." The Blind Man Cured (Mark viii. 22). The moment chosen is that wherein the Lord, after His first putting His hand upon the blind man, asks him, as He leads him out of the gate of the little city of Bethsaida, if he sees aught, and he, looking up, answers, "I see men as trees walking." The aim of the design is thus to express the gift from utter darkness of a dim, uncertain light, and the eager desire for full vision. The blind man carries an ancient three-stringed Eastern harp, of very primitive construction. Within the city, under a low-arched narrow street, are seen a Pharisee and his young disciple. The latter turns with a longing look of inquiry towards the compassionate Lord. But he is restrained by his Rabbi's hand upon his shoulder, who sternly admonishes him not to be led away by a false prophet. Above this Pharisee's head there towers in the distance a laden camel. "Ye blind guides, that strain at a gnat and swallow a camel." The same idea of antagonism to Christ *within* the city is echoed in one of the wild dogs of the Eastern streets, who lies with a litter of blind cubs at the side of the gate, and growls angrily at the passing by of the Lord. For as the unclean dogs are excluded from the New Jerusalem of the Apocalypse (Revelation xxii. 15), so within the city of the world they throng, and in the Scriptures they are named as types of persecutors, false teachers, and unholy men. A flight of seven doves, emblematic of the sevenfold fulness of the Spirit, hovers over the head of the Lord Jesus, and leaves the city with Him darkening in the evening shades. Beyond are the green pastures, bright in the last rays of the setting sun, and in their midst a fold, towards which sheep and lambs are gathering and being enclosed by a shepherd in safety from the nocturnal beasts of prey. More distant is the Lake of Galilee, with fishing-boats dotting its surface and the crescent moon rising. Inscription—"I am the light of the world."

### EARLY CELTIC MONUMENTAL INSCRIPTIONS.

IN the fourth of the present course of Rhind Lectures in Edinburgh, on "Early Celtic Monumental Inscriptions—Ogham," Sir Samuel Ferguson, Q.C., concluded the examination of Oghamic inscriptions in Ireland. Beginning with Killeen Cormac, in the county of Kildare, attention was directed to a fine pillar-stone lying near the foot of the grave-mound, inscribed in Ogham and in Roman characters. The latter meant either "the stone of Iver the Druid" or "the stone of the four true Druids." As this was the only instance of the mention of Druids on any known lapidary monument anywhere, the inscription could not but be regarded with extraordinary interest. A number of other Oghams in the neighbourhood were also described. A great number of inscriptions existed in the Cave of Drumlohan, north-east from Stradally. The stones forming the walls and roof almost all bore Ogham legends. Between Youghal and Cork, south of the Blackwater, and thence reaching westwards, began an almost continual succession of Ogham sites and monuments, extending to Kerry and the Atlantic. In the parish of Donoughmore, a farmer when ploughing some years ago found some great stones under the surface, forming a kind of pit, which contained black earth and ashes, interspersed with broken pottery. The stones on being removed were found to bear long and unusually perfect Ogham inscriptions. The ashes, &c., might indicate a boundary mark, and, if so, one could hardly look on the names recorded on the stones contained in it as other than those of proprietors taking this method of perpetuating the evidence of their titles. The forms of the inscriptions, however, did not encourage this idea. In the churchyard of the church of St. Olan, in the parish of Aghabrillog, stood what was regarded as St. Olan's pillar-stone, though the legend it bore did not commemorate him by that name. The pillar was inscribed nearly from end to end, and from various considerations the lecturer puts its date at some time in the latter part of the sixth century. The surrounding country might really be called a "lettered" moorland, so numerous were the Ogham remains. The speaker next dealt with inscriptions found in the upland between the Lee and the Bandon. The Ballybank monument, acquired by the Royal Irish Academy, was a small smooth slab, which preserved a remarkable name, Forttiguon. It had had quite a fascination for the mind of the late Rev. Daniel Haigh, who conceived this to be the name of the British king Vortigern, the inviter of the Saxons. Vortigern was an ally of the Irish Scots. After the loss of his kingdom he disappeared—some say burnt by fire from heaven; others, swallowed up by the earth;

others, in exile. His son, Pascent, continued the struggle; and was accompanied to Ireland by Eopa or Eobba. Digits in the Ogham, among other reading, yielded the name Hioba. Thus, if Mr. Haigh's reading were the true one, the word gave a good countenance to his belief that it was this Eobba who caused the monument to be engraved. Passing on, the lecturer said the grandest example of an Ogham inscribed pillar stood on the southern shore of the estuary of Kenmare. It was 25 feet long, and bore an inscription. The peninsula on the opposite side of the estuary was rich in Ogham remains. A number of these were described, and, continuing, the lecturer came round to Corkaboy, whence he set out on the Oghamic circuit of Ireland in his second lecture. In conclusion, he said that, looking back on all that had been so far observed, they might pause on some of the more obvious generalisations. First, they would, he thought, be impressed with the generally Christian character of these monuments; next, with the distinctive character of that Christianity which they represented; and thirdly, with the evidences of a popular repugnance towards it, taking its rise some time after the sixth century, and manifesting itself down to the present time. They would be inclined, he thought, to ascribe more weight to the Irish tradition of a pre-Patrician Church than had latterly been accorded to it; and, while regarding Declan, Ibar, Ailbe, and Ciaran as chronologically following rather than preceding Patrick, he would not be indisposed to regard them as representatives rather than creators of the body of Christians who dwelt south of Slieve Cua, and into whose lands neither Palladius nor Patrick, son of Calphurn, ever penetrated. A review of what remained in Ogham lapidary work in Britain might perhaps enable them to take clearer, as they would be wider, views; and he proposed in his next lecture to take up the subject in Wales and South England.

### THE MANCHESTER TOWN HALL FRESCOES.

THE picture upon which Mr. Maddox Brown is now engaged in the great hall (panel No. 5) represents the trial of Wyclif, 1377. On February 19 in that year Wyclif appeared before Convocation, in Old St. Paul's, London, but his great patron, John of Gaunt, Earl Palatine of Lancaster—son of the King, and practically Prime Minister at that time—appeared by Wyclif's side, with Lord Percy, the Earl-Marshall, and soldiers for his protection. The trial, from six o'clock till nine of that winter morn, was little else than an unseemly dispute between John of Gaunt, the sovereign of Lancashire, on the one hand, and Courteney, Bishop of London, on the other, till the citizens of London fancying they heard the Duke threatening their bishop—"to pull him out of the church by the hair of his head"—began such a riot that the trial had perforce to be postponed, and Wyclif suffered to resume his duties at Lutterworth. In the composition near to Courteney, on the dais, sits Simon Sudbury, the Archbishop of Canterbury, depicted as endeavouring, in whispers, to assuage the indignation of his colleague. At Wyclif's feet are seen the five mendicant friars appointed as his counsel, Wyclif not yet having publicly differed with them. The Earl-Marshall is represented as ordering a stool for the reformer, for, said he, "An you must answer from all these books, Doctor, you will need a soft seat," causing the Prelate still greater indignation, but Wyclif remained standing. Constance, John of Gaunt's second Duchess, a Princess of Spain, is shown plucking her spouse back by his mantle, as though in fear he might, in his excitement, do some injury to the Prelate. In the background Chaucer, the Duke's other *protégé*, is seen taking notes on his tablets. John Wyclif died peacefully in his rectory of Lutterworth seven years later.

### THE PROPOSED BRITISH SCHOOL AT ATHENS.

THE Marquis of Bute has given the munificent sum of 500*l.* to the fund for establishing a British School of Archæology at Athens. Although no appeal for support has yet been made to the public, the prospects of the school are already so good that the executive committee are enabled to contemplate the building of a suitable house on the slope of Mount Lycabettus, in the immediate vicinity of Athens, where an excellent site has generously been placed at their disposal by the Greek Government. It is intended that the house should afford a residence for the director, and should contain a library of reference. The aim of the school will be to promote the study of Greek art and architecture in their remains of every period; the study of inscriptions; the exploration of ancient sites; and especially all branches of research which can illustrate Hellenic life and literature, from the earliest age to the present day. Membership of the school will be open to all students accredited by any university or college of Great Britain, by the authorities of the British Museum or of the Royal Academy, or by any other institution qualified to give credentials. The duties of the director will be to guide the studies of the members, and to exercise a general supervision over the researches undertaken by them; to report occasionally on the work of the school, and on any important discoveries which may come to his knowledge; and also to afford information and advice

to properly accredited British travellers in Greece who may apply to him. It is believed that, through the agency of the school, valuable notes might be collected from visitors to the Hellenic countries, who, without being specialists, are competent scholars and observers; and such notes might conveniently be registered in the annual report of the school. The increasing interest in archæological studies which is being manifested in the universities and schools of the country warrants the hope that, when the school has been established at Athens, facilities will be afforded to students desirous of proceeding thither for the purpose of supplementing the knowledge derived from books by a direct acquaintance with the scenes and monuments of Greek life. A general feeling exists that England ought not to remain behind France, Germany, and the United States in the advantage of possessing a permanent centre in Greece for the furtherance of studies which appeal to so extensive and varied a range of intellectual interests; and it is of good augury for the complete success of the enterprise that the general committee, of which the Prince of Wales is president, already includes distinguished representatives of the universities and public schools, of the Royal Academy, of the British Museum, of the Society of Antiquaries, of the Society of Dilettanti, and of the London Society for the Promotion of Hellenic Studies. While it is believed that the funds already subscribed will probably be adequate for the provision of a house and library, further contributions are still needed for the purpose of endowing the office of director with a proper salary, and of creating a printing fund for the publications of the school. Any subscriptions towards these objects will be gratefully received and acknowledged by the treasurer, Mr. Walter Leaf, Old Change, E.C.; by the bankers, Messrs. Grindlay & Co., 55 Parliament Street, S.W.; or by the secretaries, Mr. T. H. S. Escott, 38 Brompton Crescent, S.W.; Mr. James Gow, 13 Old Square, Lincoln's Inn; and Professor Jebb, the University, Glasgow.

### MR. HORACE JONES'S BASCULE BRIDGE.

A SPECIAL meeting of the Court of Common Council was held at Guildhall, on Tuesday, under the presidency of Alderman Sir Francis Wyatt Truscott, to consider a report from the Bridge House Estates Committee in relation to the erection of a low-level bridge, with mechanical openings, from Irongate Stairs, near the Tower, to Horselydown. The design was published in *The Architect* in May 1883.

The report stated that the subject of crossing the Thames by a bridge below London Bridge had for the last ten years been prominently before the Court and the public, and many schemes had been introduced. The only scheme which found favour with the Select Committee on Thames Communications, appointed by Parliament last session, was a low-level bridge with openings. As far back as 1876 the Court, recognising the imperative demands of the East of London, referred the question to a committee to consider the report as to the desirability of erecting a bridge, or subway under the Thames, east of London Bridge, and the committee, in May, 1877, presented a report expressing the opinion that the best means for relieving generally the constantly increasing traffic of the City would be to construct at the site approached from Little Tower Hill and Irongate Stairs on the north side, and from Horselydown Lane and Stairs on the south side of the river, a low-level bridge, with proper arrangements for affording the requisite facilities for the passage of vessels up and down the river Thames. It would appear, therefore, that on the questions both of site and construction there was a general concurrence of opinion in favour of the Little Tower Hill site and a low-level bridge, with openings for the passage of vessels. It was hoped that the Conservators of the Thames would present no objections to the general scheme which a Parliamentary Committee could not meet. The Government too, would not oppose the general scheme provided that certain requirements connected with the Tower were complied with. Many memorials had been presented from the public and the district boards and vestries, expressing great satisfaction at the promptitude with which the Court had taken steps to supply a great public want. The Standing Orders requiring that Parliamentary notices should be given early in November had left the committee barely three months to deal with a question so important, and involving the consideration of so many details and conflicting interests; but designs for a bridge were at once taken in hand by the City Architect, who had submitted to them three designs. The committee having carefully considered those designs, submitted two of them to the Court, one for a swing-bridge and the other for a bascule, or lifting-bridge. They confidently recommended the adoption of the latter design, believing that a bridge of that construction could be more easily and speedily opened than the others. Moreover, the piers would not be so large, and would be only two in number instead of four, and, consequently, very much less of the waterway—namely, 80 feet only—would be occupied. The length of the proposed bridge from shore to shore would be 880 feet, the width would be 50 feet between the parapets, and the height above high-water mark would

be 29 feet, the same as the centre arch of London Bridge, and there would be two piers only in the tideway of about 40 feet, leaving between them a clear way of 200 feet for the passage of vessels. The approaches to the bridge would commence near the northern end of Little Tower Hill, and would have a gradient of about 1 in 70, and on the south side would commence at Tooley Street, with a gradient of about 1 in 40. The architect has estimated the expense of the new bridge and approaches at a sum not exceeding 750,000—an amount not beyond the resources of the Bridge House estates. During the eleven months prior to the sitting of the committee not more than 23 vessels on the average passed Irongate Stairs daily, and the average for ten days in March last was 14.3 per day. The architect, having taken the number of vessels passing during six tides in the present month, found that the latter figure was substantially confirmed.

Mr. Frank Green, the chairman of the Bridge House Estates Committee, in moving the adoption of the report, explained the steps that had been taken from time to time by the Council on this important question, and said that, after prolonged discussion, it was referred to the Bridge House Estates Committee to obtain and submit a design or designs for a low-level bridge, with mechanical openings, to be erected at Irongate Stairs, at the end of the street known as Little Tower Hill, together with an estimate of the expense, with a view to an application being made to Parliament during the present year. Having pointed out that the Special Bridge Committee, who sat for three years from 1876 to 1878, reported in favour of a low-level bridge at Little Tower Hill and Irongate Stairs on the north and Horselydown Lane and Stairs on the south bank, he denied that the erection of a bridge such as was recommended by the committee would interfere in the slightest degree with trade, and expressed a belief that the report contained a great deal of lasting and useful information. The committee had had an interview with the Conservators of the Thames, and had been in communication with the War Office, and in each case the replies had been as satisfactory as could be expected. Moreover, the Court would find by the report that a very large portion of the East End of London had, by a number of resolutions passed at different public bodies, advocated the very action which the committee had taken. The object they had in view was to increase the means of communication across the river at the East End of London; and the resolutions adopted by the various public bodies referred to were most satisfactory in regard to the recommendation of the committee. Mr. J. Wolfe Barry, the well-known engineer, had also been consulted, and the whole matter had been very carefully considered.

Mr. Alderman Isaacs said he should stand by what he had previously said, that he should oppose the erection of any bridge which was calculated to have the effect of interfering with the waterway of the Thames; nevertheless, he should support the report of the committee on the present occasion, because he believed that a bridge such as was recommended would not seriously interfere with the traffic of the river. Before he saw the report he was as determined as man could be to oppose the other schemes. Nothing would have induced him to sacrifice for the wishes of a few that which would be of advantage to the whole of the metropolis. On this occasion, however, he was glad to be able to support very heartily the report of the committee.

The Town Clerk then put the question, and the report was agreed to unanimously amid some cheering.

The business then terminated.

## ARCHITECTURE IN THE UNIVERSITY OF EDINBURGH.

A COURSE of forty lectures on the "History of Architecture" will be delivered by Professor Baldwin Brown in the winter session of 1884-85, with the object of affording to practical students and to others the means of becoming acquainted with some of the chief architectural epochs of the past. The subject of the course will be the chief styles which have prevailed in Europe from the time of the Greeks—Hellenic, Roman, Early Christian, Byzantine, Romanesque, Gothic, Renaissance. The origin and connection of the different styles will be described, and their characteristics illustrated by representative examples. Three points will be specially kept in view throughout:—1. The historical aspect of the buildings. These will be exhibited as in each epoch the outcome of certain social and religious tendencies, and as varying according to the spirit of different ages. 2. The constructive aspect of the buildings. The constructive forms employed at each epoch, with their special capabilities, will be explained and illustrated, as well as the part which construction has played at certain periods in determining the form and æsthetic character of edifices. 3. The ornamentation of the buildings. The decorative details employed in the best examples of each style will receive full illustration, both as regards their actual forms and their position in relation to the architectural effect of the structures.

It is believed that historical lectures of this kind may have a distinct practical bearing upon the work of young architects in

their profession, and that from the great examples of the past they may learn lessons of the highest value. The buildings of by-gone ages are not to be regarded as models to be copied by the architect of to-day, so much as examples of the successful carrying out of right architectural principles, which are essentially the same in every age. Such principles as that of the suitability of a building to its use and to its environment, of the necessity for clearness and consistency of plan, of the proper use of ornamentation, both as regards amount and position, of the suitable forms of decoration for various styles, with other principles equally important, are abundantly illustrated in the masterpieces of the past, and a study of these cannot fail to assist towards a habit of right thinking on these and kindred matters, on the part of the student of to-day.

## THE OGHAM INSCRIPTIONS OF WALES.

THE fifth of the course of Rhind lectures in archæology was delivered by Sir Samuel Ferguson, Q.C., on Monday afternoon. Dealing with the Oghams of Britain, the lecturer said that, although much less numerous than those of Ireland, they had, in almost every instance, the great advantage of being accompanied by Roman epigraphs, of which they generally were found to be echoes. It might, therefore, be affirmed that they belonged to a period subsequent to B.C. 56, and some of them might, on reasonable grounds, be referred to the period of Roman occupation ending in A.D. 410. Of the latter the most remarkable was that inscribed on one angle of the base of the Roman altar preserved at Laughar, in Glamorganshire. There was no doubt of the genuine character of the altar. Neither could there be any question that the characters were true Ogham, although letters *l* and *c*, with indistinct traces of some vowel notches, were all that could now be recognised. If a contemporary inscription, it put the use of Ogham in Britain back into the time of surviving Paganism, and greatly impaired the argument for its Christian origin, and it would be a somewhat forced assumption to say that it had been added by a later hand. Conjectures of that kind had been employed to rebut the presumption that Oghamic monuments marked with the cross belonged to Christian times. If, as he conceived, these were inadmissible, much more so would be the theory of the employment of a legend not having any Christian significance to sanctify a relic of Pagan worship. The Laughar altar should, therefore, in any philosophic examination of the question, be provisionally regarded as a self-evidencing Oghamic relic of the Pagan period. It was also, with one exception, the only British Ogham unaccompanied by a Roman context. Having noticed the Vitalianus inscription at Cwm Gloyn, near Nevers—which with the Roman epigraph seemed to import that Vitalian was a retired military servant of the Empire—and other Oghamic inscriptions in Pembrokeshire, Breconshire, and Carmarthenshire, Sir Samuel said all these indeterminate Welsh monuments, of which it could only be predicated that they were of possible Roman but not demonstrably of Christian times, were found in South Wales. One Ogham-inscribed monument only had been hitherto found in North Wales, and it belonged to the same category. Two others of a similar character were found in Devonshire, including the Fardel monument, now in the British Museum. The cross-signed Ogham monuments of Wales, which gave a presumption of Christian origin, were, he said, hardly less numerous than those not so distinguished, and in the palæographic point of view might claim an equal antiquity. On the Kenfigg stone, in Glamorganshire, were the essential parts of the legend—*Merlingi anmagi liana*. The designation of Merlin in Welsh tradition was *an map liana*, or the misborn son of the nun. He was the child without a father of the legend of Vortigern, the very head of Welsh esoteric mystical doctrine. He did not suppose that was his grave, but he held that the monument was later than the story of the Nun of Carmarthen, who founded the Druids of Vortigern, and that they must consider Ogham writing and the formula *magi* to have survived in Wales down to, at least, some time after the fifth century. Having described the Llywell monument—one of the most elaborately designed and decorated of all the British crosses—the lecturer said they could not look on these survivals of the Pagan taste, intermingling with the first efforts of art in Christian symbolism, without a strong conviction that the monument belonged to the very earliest age of Christianity in Britain, and that the much-discredited date of the end of the second century for the mission of Fagan and Dubric looked less improbable in the light of that lapidary record. It was difficult to understand how the formulas in use in these inscriptions were *magi*, *maccu*, and that so many of the proper names were Irish in aspect, unless on the theory of an Irish Celtic occupation of those parts of Wales and South Britain in which the monuments were found; and the fact of some such occupation during the second or third century was very strongly attested, both by Welsh and Irish authority of a high antiquity. If they accepted the theory of an identical speech in Ireland and Britain before the epoch of Cunedda, they must refer the Oghams, of which he had been speaking, to the fourth, fifth, and sixth centuries, although asso-

ciated with epigraphs which they had been taught to regard as two, three, and four centuries later in date. His own inclination was to accept the theory, and to admit that, *ceteris paribus*, a British claim to have imparted that kind of writing to the Irish would rest on reasonable probability. A greater than the palæographic difficulty must, however, be surmounted before they could say that Ogham was of British as distinguished from Irish origin, or *vice versa*. On the one hand, they might have been struck, in the Welsh examples, with the absence of scholastic trickeries. On the other, they would have noticed that they almost all presented their genitive name-terminations in the Latin *i*; and that such forms as the Irish *ias, as, os, o*, were absent. If they tried to estimate what time it took the *ias* genitive to shorten into *as* and *a*, or the *i* genitive to recede from the termination, and hide itself in the body of the word, as in *maic* for *magi*, they should find themselves demanding periods long behind the Roman advent; and must, in that case, give the prior use to the place in which these forms were found. But if these be not true inflectional forms, but only pedantic devices of the Irish carvers, the conclusion would be that Ogham writing, after its discontinuance in Wales, went on through several stages of a spurious refinement in the south of Ireland; and to that conclusion he acknowledged his own mind was at present the more attracted. The discontinuance of Ogham writing in Wales seemed to correspond in date with the reforms consequent on the mission of Augustine. Both in Wales and Ireland there had been great need of reformation. Gildas had drawn the British half of the picture in very dark colours; but with outlines too indistinct to give us more than an indefinite sense of vice and apostasy. The Irish hagiologists were also vague and unsatisfying; but they indicated substantially that there was something much amiss in the Irish church about the same time. Brigid had prophesied that evil teachers were to come who should overthrow doctrine and seduce almost all men; and her biographer, Cogitosus, declared that when King Ainmire, the reformer of the Bards, called in Gildas to restore ecclesiastical law, all, from the highest to the lowest, had lost the Catholic faith; while St. Hildagard, in her life of Desibode, showed the continuing belief in some great heterodoxy of the Irish of the sixth century, by representing them as having in many cases turned Jews, and in many relapsed into paganism. In that view of the two churches—both Ogham-using, and both under orthodox censure—they might, the lecturer thought, see the causes which in Wales led to the disuse of that kind of writing, and in Ireland to the disuse, also, of the graveyards of those who practised it.

### BUILDING IN AMERICA.

THE present year has been so far a busy one for the United States building trades, and real estate has fetched much better prices than during the last year. In most of the great cities the number of large houses and commercial blocks now being erected is very considerable, especially at Chicago, where at least 16,000,000 dols. per annum is being spent in this direction. St. Louis is being added to in the shape of residential houses, although in the city itself the building is limited more to small factories and retail shops. Cincinnati is laying out a good deal of money, and especially in renovations and repairs, of which about 40 per cent. of the work will consist. At Baltimore and Boston building is also active, in the former city of speculative two-storey houses for rental. New York is still indulging in the favourite tall structures—a doubtful taste, which does not find favour in Boston.

### HELLENIC SOCIETY.

AT a general meeting held at 22 Albemarle Street on October 23, when Professor C. T. Newton was in the chair, the Rev. Edmond Warre, Head Master of Eton, read a paper on the "Raft of Ulysses," as described in the fifth book of the Odyssey. By personal research and observation of modern processes of ship-building the writer had arrived at a clear idea of the construction of the raft in question, and set forth his conclusions in detail, illustrating them by two models of a raft and of an ancient axe and adze which had been made under his direction in the school of mechanics at Eton. Mr. Warre alluded to a striking confirmation of his theory which he had lately seen in the construction of certain flat vessels which are used at Portsmouth for raising heavy weights from the water. Mr. Newton, after thanking Mr. Warre for his valuable paper, reminded the audience that there existed in the British Museum two genuine fragments of ancient vessels—(1) a bronze figure-head from the Bay of Actium; and (2) a cross-beam from the floor of an ancient galley dredged up from the bottom of the Lake of Nemi. Professor Jebb considered that Mr. Warre's paper not only for the first time made quite clear the passage in the Odyssey, but also explained the poetical use of the term *σκηδία* for ships in general in a passage in the *Hecuba* of Euripides, because it showed that such a raft seen from land would really resemble a ship. Mr. E. A. Gardner read a paper on some armour and ornaments from Kertch, which were now in the new

museum at Oxford. After a description of the several articles, Mr. Gardner showed that the importance of these finds in the Crimea lay in the fact that, if not of Athenian handiwork, they were certainly of Athenian design, and so might be added to the comparatively scanty remnant of genuine Hellenic metal-work. In connection with the representation of a camel upon one of the ornaments, Mr. Newton pointed out that in a bronze found at Kameiros, and now in the British Museum, a man with an Assyrian cut of beard was seated upon a kneeling camel. This bronze, though possibly of Phœnician design, was found in association with other objects belonging to archaic Greek art. Professor P. Gardner, alluding to the complete and sumptuous way in which the results of these Russian discoveries were published, said that in this respect despotic Russia set a good example to free England.

### THE CORN EXCHANGE, IPSWICH.

THE lighting of the new Corn Exchange, at Ipswich, has not given satisfaction to the brokers who assembled in the building, and the Estate Committee of the Town Council accordingly sought the advice of Mr. Bellamy, architect, of Lincoln. The following report has been presented to the Committee:—

"Lincoln, September 26, 1884.

"Gentlemen,—In compliance with your letter, dated August 1, 1884, respecting the want of light in your Corn Exchange, I beg to say I have made a personal inspection of the building, and have the honour to report for your information. I am of opinion the complaint arises from the fact of the roof light being at too great an elevation from the object to be examined; besides, there is a cross or confused light occasioned by windows being placed on the south side and west end of the walls.

"From my experience after erecting over a dozen corn exchanges, I am of opinion your light may be improved (without injury to the general design), and to accomplish this I would advise the following:—

"First.—Exclude the prejudicial light and sun's glare from the south and west windows; this may be done by portable, light skeleton frames and felt being placed in the existing window recesses, yet retaining a slight recess, thereby gaining a large space or panel for advertising purposes or decorations. Approximate estimate, 35/.

"Secondly.—Remove the whole of the slates and plaster on the north side of the roof, also break out a larger opening in the north-west wall and substitute glass. Approximate estimate, 150/.

"Thirdly.—Reduce the height of north parapet wall within nine or twelve inches of the gutter bottom, so as to obtain all the light possible at the eaves of the roof. Whilst I have failed to see a detailed drawing of the roof (as to the construction), I am persuaded much valuable (north) light may be gained by the removal of the heavy wood purlins and intermediate rafters, substituting for the former rolled iron or a combination of iron and wood of small scantling and totally dispensing with the latter; these timbers have doubtless been introduced simply to correspond with the south side, which, from the nature of the covering, necessarily required more strength. Approximate estimate, 70/.

"I further suggest the removal of the mullions, transoms, and head of each north window (this can be done without injury to the reveals), and substitute iron sashes with large sheets of glass, by which a further increase of valuable light would be obtained. Approximate estimate, 110/.

"I have every reason to believe, if these suggested alterations are carefully carried out, the object you are seeking (as to light) will be greatly improved and appreciated by the merchants.

"The windows on the south side of the Exchange being useless, four additional private rooms (on the first floor) can with advantage be added to the existing offices (one to each), and so raise the external balustrade and lead flat roof, which I think would improve Little King Street front, and also prove remunerative.

"Your Exchange Hall being from 15 to 20 feet in height greater than any corn exchange I have built or seen (necessitated I suppose by way of making the undertaking more remunerative) does, in a great measure, account for the difficulty experienced by merchants in judging the quality of grain; if, therefore, the suggested alterations do not satisfactorily meet the difficulty, such can be overcome by the introduction of an intermediate floor, say 10 or 12 feet above the present floor level. This I have roughly worked out, and find it can readily be done by introducing an easy wide staircase on each side of the main entrance, by taking a small portion of the end of each shop, also sitting-room over. By this arrangement the space forming the inner lobby would be added to the Exchange, and each shop and office (next Little King Street) could have a store-room at the back with floor light from the Exchange. I cannot give estimate without preparing plans and sections.

"With regard to the ventilation, I find some patent system of heating and ventilation has been adopted. I therefore doubt not, if any little failure is reported to the patentee, matters would soon be put right, and anything suggested by me might prove detri-

mental to the apparatus; yet, in altering the windows before referred to, each might have a portion to open and shut at pleasure, and the like with ventilators in the gables.

"If the south side of the roof has not boarding and felt under the slates, I strongly recommend such being introduced, as it would exclude the heat and cold, and add greatly to the comfort of the hall in all seasons of the year, besides being beneficial in acoustic properties.

"In conclusion, I may say you have got upon your site a well-designed block of buildings, and your architect has evidently had a desire to do his best to make the same remunerative, and I venture to say if the suggested alterations are effected, you would have a first-class Corn Exchange.

"I am, gentlemen, your obedient servant,  
"P. BELLAMY."

It was resolved to exclude the light from the south and west windows of the Exchange by way of experiment, and to substitute glass for the slates and plaster in the three sections of the roof on the north side.

## THE AWARDS AT THE HEALTH EXHIBITION.

THE list of honours awarded by the international juries of the Health Exhibition has at length been announced. Altogether 1,432 names of individuals or firms appear, exclusive of those of recipients of the special prizes given by the Society of Arts. The total number of gold medals awarded is 278, of which 242 will be presented. The Society of Arts present 11 medals. The "Joint Stock" prize, a Society's gold medal, or 20%, for the best example of sanitary architectural construction (Classes 20, 28, 29, 30, 32), has been awarded to Messrs. Doulton & Co. The "Siemens" prize, a Society's gold medal, or 20%, for the best application of gas to heating and cooking in dwellings—Class 24—is obtained by Mr. Thomas Fletcher, for articles shown by Messrs. Deane & Co. The "Stacy" prize, a Society's gold medal, or 20%, for the best exhibit in Class 30 (objects for internal decoration and use in the dwelling, fittings, and furniture), by Messrs. Collinson & Lock.

The Exhibition gold medallists in Group 3 (the dwelling-house) are as follows:—

Class 20. Dwellings, models, and designs for the same, and specimens of buildings erected in the grounds. Fittings and accessories for dwelling-houses. Completely-fitted apartments.—Class 21. Water supply and purification. Meters, filters, water-fittings, cisterns, &c.—Class 22. House drains, their construction and ventilation. Sewer disconnection; sinks, traps, gullies; the disposal and utilisation of house refuse.—Class 23. Water and earth closets, ash closets, commodes, urinals, disinfecting powders and fluids, insect destroyers.—Class 24. Grates, stoves, kitcheners, ranges, boilers, &c., for domestic use. Apparatus for heating and warming, smoke abatement, &c.—Class 25. Ventilators, air inlets and outlets, cubic space of rooms, cowls, air straining and cleansing.—Class 26. Lighting apparatus—(a) electrical apparatus for illumination and domestic use, secondary batteries, electrolisers, accumulators, &c.; (b) apparatus for lighting by gas, gas producers, gas meters, gas fittings, chandeliers, &c.; (c) oil and other lamps, mineral oil, wax and other candles, vegetable and animal oils.—Class 27. Fire-prevention apparatus—extinctors, portable engines, domestic fire-escapes, &c.—Class 28. Materials for sanitary house construction—roofs, walls, damp courses, solid floors, damp-proof wall coverings, cements, &c.—Class 29. Materials for sanitary house decoration, non-poisonous paints and wall papers, floor coverings, washable decoration, &c.—Class 30. Objects for internal decoration and use in the dwelling. Fittings and furniture.—Class 31. Baths, bathing requisites, public and private wash-houses, washing apparatus, detergents, appliances for personal cleanliness, &c.—Class 32. Publications and literature, models, pictures, diagrams, &c., relating to Group 3.—Class 33. Machinery and appliances relating to Group 3.

Adams, Robert (20); Andreas, Theo. H. (India) (29); Banner Brothers & Co. (22), gold medal (22 and 25), three silver medals, and (22) bronze medal; Beck & Co. (21), gold medal (21 and 23), two silver medals, and (21) three bronze medals; Benham & Sons (20); Birch, George H. (20 and 52), two gold medals; Birmingham Sanitary Association (22); Bowes, Scott & Read (22); Boyd, David O. (24); Bradford, T. & Co. (31 and 33), two gold medals, and (22 and 23) two bronze medals; Brown & Green (24), gold medal (20), silver medal, and (24) bronze medal; Broxburn Oil Company (26); Burke & Co. (30); Cacheux (France) (20); Calvert, F. C. & Co. (23), gold medal, and (31) silver medal; Candy & Co. (28), gold medal, and (22) two bronze medals; Capper, Son & Co. (22), gold medal, and (21) bronze medal; Chamberland, Dr. (France) (21); Chubb & Sons' Lock and Safe Company (Limited) (27), gold medal, and (20) silver medal; Cleaver, F. S. & Sons (31); Clements, Jeakes & Co. (31), gold medal, and (33) bronze medal; Cliff, Joseph & Son (20), gold medal (22 and 31), three silver medals, and (22 and 30) two bronze medals; Coalbrookdale Company (Limited) (21), gold medal (24 and 30) two silver medals, and (24) bronze medal; Collinson & Lock (30); Condry & Mitchell (Limited) (23); Crabtree Brothers (24); Craig, J. & M. (22), gold medal, (28) silver medal, and (22) bronze medal; Davey, Paxman & Co. (33); Decauville

(France) (20); Deane & Co. (24); Dent & Hellyer (22), gold medal, (21, 22, and 23) five silver medals, and (21) two bronze medals; Doulton & Co. (20, 21, 22, 23, 24, and 52), nine gold medals (21, 22, 23, and 30) fifteen silver medals, and (21, 22, and 24) five bronze medals; Dowson Economic Gas Company (Limited) (26); Durand-Claye (France) (23); Eagle Range and Foundry Company (24); Ebner, Joseph F. & Co. (Austria-Hungary) (30); Farmiloe, Thomas & William, (21) gold medal, two silver medals, and one bronze; Field, J. C. & J. (26 and 31), two gold medals; Galloway & Sons (33); General Gas Heating and Lighting Apparatus Company (Limited) (24); Geneste et Herscher (France) (23, 25, 35, and 41) four gold medals, (31A and B) silver medal, and (9) bronze medal; Glenfield Company (21), two gold medals, and (22) silver medal; Glover, George & Co. (26); Haibara, N. (Japan) (30); Hitchins' Fireproof Plastering Company (28); Improved Industrial Dwellings Company (20); Indestructible Paint Company (Limited), (29); Jackson & Graham (30); Jameson's Patent Cooking Company (24), gold medal, and (26) silver medal; Jeffery & Co. (20 and 30), two gold medals; Jennings, George (21, 23, and 31), four gold medals, (21, 22, and 23) six silver medals, and (22) bronze medal; Jones, Frederick & Co. (28); Keith, James (24), gold medal, (26) silver medal, and (12) bronze medal; Kent, George (21), gold medal, (20) silver medal, and (12, 21, and 26) four bronze medals; Kite, C. & Co. (25), gold medal, and (22) silver medal; Knight, John & Sons (31); Kutsutani, T. (Japan) (30); Lawrence & Co. (Limited) (21) gold medal and (12) silver medal; Le Grand & Sutcliffe, (21) one gold and one bronze medal; Lefevre, J., Belgium (29); Lyon, Washington, (23) gold medal, and (33) silver medal; Mackey, Mackey & Co. (23); McDougall Brothers, (23) gold medal, and (31) bronze medal; Maignen, P. A. (21), (31 A and B) two gold medals, (11 and 42) two silver medals, and (31) bronze medal; Manufacturers' and Millowners' Mutual Aid Association (22); Moule's Patent Earth Closet Company (23); Musgrave & Co. (24); Native Guano Company (Limited) (22); Nobel Brothers (26); Ota, M. (Japan) (30); Owen, Henry & Co. (23) gold medal, (23) silver medal, and (22) bronze medal; Parkinson, W., & Co. (26) gold medal, and (21) silver medal; Porter, John H. (21), gold medal, and (33) silver medal; Price's Patent Candle Company (Limited), (26 and 33) two gold medals, and (31) silver medal; Quirk, Barton & Co. (21) gold medal, and (28) silver medal; Rimmel, E. (31) gold medal, and (23) silver medal; Rottmann, Strome & Co. (29) gold medal and (30) bronze medal; Rowe & Co. (31); Salmon, David (31); Sanitary Appliance Company, (23) gold medal, and (20) bronze medal; Schaeffer, F. (Belgium) (24 and 35) two gold medals; Shanks & Co. (21 and 31) two gold medals; Sharp & Co. (21), gold medal, (22) silver medal, and (21, 22, and 25) four bronze medals; Simmons & Tullidge, (33) gold medal, and (45) bronze medal; Simpson & Co. (21); Spencer, J. (21); Starkie, Gardner & Co. (30); Steel & Garland, (24) gold medal, (24) silver medal, and (30) bronze medal; Stidder, J. G., & Co. (22) gold medal, (21 and 23) two silver medals, and (21, 22, and 23) seven bronze medals; Stones, John (20); Sugg, W., & Co. (Limited), (26) gold medal, and (24) silver medal; Thompson, H., & Co. (29); Thompson, Henry, Canonbury (24); Treutler & Schwurtz (Germany) (25); Tubouchi, A. B. Ya (Japan) (30); Tylor, J., & Sons, (21 and 31) three gold medals, (21 and 23) two silver medals, and (21, 22, and 23) eleven bronze medals; Yamamoto, S. (Japan) (30); Yates & Co., (29) gold medal, and (30) silver medal; Wadsworth, Henry & Son (22); Waller, Geo., & Co. (22) gold medal, and (22) bronze medal; Walton, F., & Co. (30); Wardle & Co. (30); Warner & Ramm (30); Warner, John, & Sons, (21) gold medal, (21 and 23) three silver medals, and (21 and 23) three bronze medals; West Central Sanitary Engineering Company, (22) gold medal, (21, 23, and 31) five silver medals, and (23) two bronze medals; White, William, Abergavenny (28); Wilcock & Co. (20 and 30) two gold medals, and (20 and 22) two silver medals; Wilkes Metallic Flooring and Eureka Concrete Company (28); Woollams, William & Co. (29); Willesden Waterproof Paper and Canvas Works (Limited), (20 and 29) two gold medals, and (30) silver medal.

## LEGAL.

### High Court of Justice, Oct. 28.

(Before Mr. JUSTICE MATHEW.)

COLEMAN v. GITTINS.

ARCHITECTS' CERTIFICATES.

This was an action to recover the balance alleged to be due on a building contract, and one point raised was of interest. The contract, which was made in August 1883, was to erect part of the refrigerating apparatus for the South London Fish Market. By the contract payments were to be made at the rate of 80 per cent. on the value of the work done as it proceeded, and the balance was to be payable in two months after the architect should have expressed his satisfaction with the completion of the work. By another clause of the contract the final balance was not to be payable until the architect should have given his final certificate. By a letter in September 1883 the architect expressed his satisfaction

with the work, but the final certificate was not given until January 1884, and the action was commenced within two months of the delivery of the final certificate.

His Lordship was of opinion that the intention of the parties, as expressed by the contract, was that the satisfaction of the architect was to be expressed by his final certificate, and that as the action had been commenced before the expiration of two months from the delivery of the final certificate the defendant was entitled to judgment. The defendant, however, had not paid the amount at all, and His Lordship said that as the defence was technical and devoid of merits he should direct that the judgment be entered without costs.

**Court of Session, Edinburgh.—Outer House.**  
(Before LORD ADAM.)

SIR ALEX. JARDINE v. HOPE JOHNSTONE AND OTHERS.

In this action Sir Alexander Jardine, of Applegarth, Bart., sought to have the heritors of Applegarth and Sibbaldie, Dumfriesshire, interdicted from removing from the parish church of Applegarth the gallery, which he was entitled to occupy with his family, and from interfering with it when making the necessary repairs on and reseating the church. He further sought to have the respondents ordained to restore the gallery so far as removed by their orders. For the repair of the church estimates had been accepted to upwards of 1,000*l.*, a third of which falls upon Sir Alexander Jardine. The repairs did not include any structural alteration of the fabric, but were principally alterations on the roof and the raising of the level of the floor, the latter involving the heightening of the gallery. It had been suggested that the complainer should bear the expense of heightening the gallery, but as he did not desire any alteration he refused to incur any individual liability. The heritors, however, resolved to remove the gallery, and in these circumstances the complainer made the present application, pleading that he was entitled to interdict, that the gallery had been allocated by his predecessors, and had been possessed by them and himself from time immemorial. The respondents allege that the beams and part of the gallery were going to decay and entirely unfit to be used again, and that it had always been their intention to re-erect the gallery according to plans agreed on by the complainer himself and the other heritors; and that the cost of taking it down and re-erecting it is the only matter in dispute; and that consequently the action was unnecessary.

The Lord Ordinary closed the record, and continued the case to allow of parties arriving at an extra-judicial settlement.

**The Decoration of the Dome of St. Paul's.**

SIR,—I shall be glad to be allowed to enter a little more into detail than I did in your issue of the 18th ult.

It is clear, I think, that in deciding upon the character of the decorative treatment of the dome, the key must be sought in the work actually existing, and which will always exist. What—described in general terms—is this?

First, at the base, there are eight great piers and eight great arches, surmounted by an unbroken cornice sweeping over the tops of the arches, and marking, in a striking manner, the curve and vast dimensions of the dome. Then comes the drum or wall, in which the twenty-four windows are placed, divided by pilasters on its periphery into thirty-two equal parts. Above this is another unbroken cornice crowning all these details of Wren's architecture, and marking distinctly, and with an unbroken line, the base of the dome. Now, if there be one principle of architectural design in all this more striking than another, it is horizontality. Once free from the piers at the base, the determination of the great architect to get as soon as possible to straight unbroken horizontal lines is perfectly obvious. The first cornice is unbroken. The curve of the drum is interrupted only where absolutely necessary for light—for the twenty-four windows. The surmounting cornice is unbroken. And in consequence of the circular plan of these details, they all mark in the most effectual manner the grand sweep of the dome. Wren seems to have been determined to avoid vertical interruptions, seems to have been anxious to make the periphery of his majestic dome the striking feature. And he succeeded. If, then, this is a correct general description of the existing design below the dome which it is intended to decorate, we are in a good position to ask—What should be the character of the decorative treatment of the dome itself?

For my own part, it seems strange to think of a lofty vertical arrangement, such as is proposed, surmounting this—in principle—almost Greek design. I cannot think that anyone whose opinion would be entitled to consideration would hesitate to say that the horizontal principle of treatment should be continued upwards to

the very crown of the dome; that the decoration of the dome should be in zones, and that the attempt to imitate solid architectural construction (as in the proposed vertical ribs) should be abandoned. Such vertical lines as are necessary might be very subdued, and should plainly indicate their purpose of dividing the pictorial subjects by being purely ornamental. Ancient and modern examples are abundant. There are the beautiful borderings of the Nasoni mausoleum, Raphael's frescoes at the Vatican, Peruzzi's at the Farnesina, and many others. Delaroche's great hemicycle at Paris is without marked vertical divisions, although the subjects embrace centuries of time. The work of Sandro Botticelli, recently placed in the National Gallery, is an example of the arrangement of a circular zone on the flat, and history records the sensation it created after it was first exhibited. And although on the dome of St. Peter's at Rome there are vertical ribs, they are so subsidiary as not to interfere with the zones of prophets, of apostles, and of the heavenly host. Under these circumstances I venture to think that if the attempt to connect the dome with the architectural details below it by means of sham architectural ribs were abandoned, a better result would be secured. There would be greater scope for artistic treatment on a grand scale—a scale suited to the distant point of view on the floor below.

I am, yours faithfully,  
AN OLD ARTIST.

**Commercial Arbitration.**

SIR,—In connection with the late Arbitration Conference held under the auspices of this Chamber, I would ask your permission to state one or two facts with a view of informing the commercial public as to what machinery has been provided by the London Chamber for the more satisfactory and rapid settlement of disputes by arbitration.

In the first instance, an agreement of reference has been carefully prepared after consultation with the most experienced solicitors and counsel, which will, I have every reason to believe, render awards absolutely binding. Under this agreement the London Chamber of Commerce only consents to exercise its jurisdiction when both parties agree, under its by-laws, to make the award a rule of court of the High Court of Justice. This stipulation renders it impossible to upset the arbitration award on the merits of the case itself, but only if the procedure of the arbitrator or arbitrators, or the conduct of the case, should prove to have been in any way faulty. It will be the particular function of the Arbitration Committee of the Chamber to watch that no such faulty procedure shall be possible.

The second important step taken by the Chamber to provide machinery for arbitration cases, has been by the nomination (by its various trades' sections) of the leading members in the principal branches of trade, to act as arbitrators for cases arising in matters connected with their particular specialities. Lists of arbitrators have now been compiled by the Textile, Chemical, Leather, Coal, Printing, and allied and West African Trade Sections, and there is every reason to believe that the other sections of the Chamber will, on the recommendation of the Council, provide similar lists.

It will thus be possible for the first time for disputants in commercial cases to select arbitrators or umpires from a list of nearly one hundred names connected with the largest and most respected firms in the City of London. The by-laws of the Chamber provide for the most rapid action immediately upon the signing of the Agreement of Reference by both parties, and the costs of the Chamber are merely nominal. The arbitrators' fees, also, are as low as is consistent with the employment of first-class and independent experience.

There is thus every reason to believe that the commercial community have now at their disposal, if they choose to avail themselves of it, a reliable, cheap, and rapid means of satisfactorily terminating business disputes.

I am, dear sir, yours faithfully,  
RICHARD MURRAY, Secretary.

The London Chamber of Commerce (Incorporated),  
84-85 King William Street, E.C.:  
October 23, 1884.

**WORKS IN PROGRESS.**

**Messrs. Oldis Bros.**, builders, of 20 Finsbury Pavement, and 35 Wilson Street, Finsbury Square, are rebuilding the extensive organ factory close to St. Pancras Station.

**The American Elevator Company**, 38 Old Jewry, E.C., have just received an order from Messrs. Elliott Bros., Sydney, N.S.W., for the erection in their new warehouses of a large goods lift of the "Standard" hydraulic pattern, which is to run from the basement to the fourth floor, a distance of over 60 feet, and capable of lifting 20 cwts. in addition to the weight of the cage. The lift is to have the same safety appliances as are attached to the passenger machines, so that the workmen may ride up and down with their load with perfect safety.

**A New Illuminated Four-Dial Turret Clock**, with the Cambridge or Westminster chimes, and five large bells, have been supplied and fixed in the new town hall, Hyde, Cheshire, by Messrs. William Potts & Sons, clock manufacturers, of Guildford Street, Leeds. The clock and bells were formally set going by the donor, Mr. Joshua Bradley, of Godley, on Saturday last. The opening day was observed as a general holiday. Mr. Bradley's gift adds greatly to the appearance of the fine building, which has been erected by Messrs. Beaumont, architects, of Manchester.

### NEW BUILDINGS.

**Airdrie.**—The Airdrie Working Men's Reading and Recreation Rooms having been found insufficient, the club have decided on building new premises in Broomknoll Street. The plans have been prepared by Mr. George Arthur, architect. The new premises will comprise a billiard-room for six tables, a large reading-room, and committee and janitor's rooms, as also three bath-rooms. The building will extend 106 feet back, and will have a frontage of 52 feet.

**Extension of Newcastle-on-Tyne.**—The new town at the west end is progressing, and about a hundred houses are completed or nearly completed. They are built in flats, according to specifications insisted upon at the time the ground was sold to the contractors. Each upstairs flat is divided into four rooms, and there are three rooms to each lower flat. The bricks of which the houses are composed are made on the spot by Mr. A. Murray. With the machinery at his command, he can turn out in a week about 80,000 bricks. These, by arrangement with the architect, are sold at the rate of 22s. per 1,000 to the contractors. Up to the present time about 18,000 superficial yards have been sold for the purpose of building, and besides this, 2,000 are reserved and virtually sold. The estate was laid out by Mr. William Glover, architect, 16 Market Street, Newcastle-on-Tyne.

### CHURCH BUILDING AND RESTORATION.

**Abbotskerswell.**—The parish church of Abbotskerswell, about two miles from Newton Abbot, has been reopened after restoration, which has cost about 1,400*l*. The contractors for the work were Messrs. Luscombe & Son, of St. Sidwell's, Exeter, and the architect was Mr. W. Butterfield.

**Blackburn.**—The corner-stone of St. Barnabas Church was laid on Saturday last by Mr. Randle F. J. C. Feilden, of Witton Park. The church comprises chancel, nave, side aisles, transept, clergy and choir vestries, and, owing to the fall of the land, a large parish-room has been provided under the chancel. The works have been let to Messrs. Marshall & Dent, of Blackburn. The tender of Messrs. Mercer Bros., of Blackburn, has been accepted for the hot-water apparatus. The number of sittings, which are all free, is 722, and the amount of the contracts is upwards of 6,000*l*. Mr. Varley, of Blackburn, is the architect.

**Derby.**—The foundation-stone of the new church of St. Barnabas has been laid. The architect is Mr. A. Coke Hill, and the builders are Messrs. Walker & Slater. The total length will be 138 feet, and the width 61 feet, and accommodation will be provided for 726 persons. Only the nave and aisles will be erected at present.

**Northampton.**—St. Crispin's Church, built for the shoe operatives of Northampton, has been opened. The work has been carried out by Messrs. Reynolds & Son, of Derigate, Northampton, from the plans of Mr. M. H. Holding, A.R.I.B.A., Market Square. The exterior walls are of rich brown Northamptonshire stone and Westwood Bath stone dressings. The lower portion of the interior of the edifice is finished in fine chopped-face Duston stone, and the whole of the upper portion plastered and prepared for a scheme of decoration in figure-work illustrating the life of St. Crispin.

**North Tyne.**—Birtley Church, North Tyne, has been reopened after restoration. The total cost of the work executed has been 1,300*l*. Mr. Arthur B. Plummer, A.R.I.B.A., of Newcastle, is the architect; Mr. William Welton, of Birtley, the contractor for the masonry, &c.; and Mr. William Knox, of Consett, for the carpentry. The east end has been rebuilt. A new rose window has been inserted in the west end. The reredos, communion rail, choir pews, pulpit, &c., are in oak; the nave pews in pitch pine, varnished. The old flat ceilings have been removed, and a pitch pine moulded panelled vaulted roof, with trefoil piercings, inserted. During the work an aumbrey and many other ancient remains were discovered. The original church dates from about 1100, and the sash windows of more recent years have been replaced by triplet Early English windows. The tiles in the chancel have been laid by Messrs. W. B. Wilkinson & Co., of Newcastle, and the ironwork is by Mr. Smith, of Hexham. The former barn-like outline of the building has been broken by terminal crosses, footstones, and buttresses.

**Skelton-in-Cleveland.**—This church, which was commenced in 1881, has been completed at a cost of nearly 15,000*l*. It consists of nave, with north and south aisles, choir, chancel, organ-

chamber, and vestry. The style is Early English. The walls are composed of hammer-dressed freestone, principally obtained from a local quarry, the south front, the windows, doors, piers, and arches, being of freestone, from a quarry at Glaisdale. The expense of the building has been met by money in the hands of a Building Committee, arising from the sale of church lands and subscriptions. Mr. J. T. Wharton has defrayed the cost of the tower.

**Stoke Newington.**—The church of St. Andrew, which has been erected for the use of a new district, has been consecrated. The building is Early English in style, and consists of nave, transept, with a hollow recess in lieu of chancel. Mr. A. W. Blomfield, M.A., is the architect.

**Sunderland.**—The new chapel, entrance lodge, and gates at the Southwick Cemetery, near Sunderland, have now been completed, from the designs and under the superintendence of Mr. H. T. Gradon, architect, of Durham. The whole of the works have been carried out by Messrs. Walter Scott & Son, contractors, of Sunderland, at a total cost of 1,544*l*.

### GENERAL.

**M. Antonin Proust** is likely to be appointed Commissioner-General for the National Exhibition which it is intended to hold in Paris in 1889.

**An International Exhibition** is proposed in Edinburgh, to be held during the summer of 1886.

**Mr. Ruskin** states that he has not seen the water-colour drawings which have been found in Exeter and are ascribed to Turner.

**The Executive Committee of Truro Cathedral** report that since February a sum of 11,500*l*. has been promised, but that nearly 9,000*l*. more will be required to complete the transept, lantern, stage, clock-tower, and other works, as payments have been made in excess of the estimates to the amount of 5,000*l*.

**The Art Collections** in the Corporation Galleries, Glasgow, have been again in danger of destruction, owing to a fire in a baker's shop which forms a part of the premises. The loan collection, which includes the Bute pictures, is worth 120,000*l*.

**An International Chalcographical Society** is in course of formation, its aim being to promote the scientific study of the history of engravings. Application for membership may be made to Mr. Thibaudeau, 18 Green Street, S.W.

**Mr. G. R. Strachan**, who has been for a short time surveyor in Chiswick, has been appointed surveyor of Chelsea, in succession to Mr. Stayton. There were eighty-two candidates.

**The Prince of Wales** proposes to lay out about one hundred acres of his estate at Roche, near Padstow, in building plots. They will be disposed of on such terms that everyone desirous of building will be able to erect a house and make it a freehold.

**The Surplus** left after paying expenses at the Health Exhibition is expected to amount to 30,000*l*., or double the sum left by the Fisheries Exhibition.

**The Manchester City Council** on Wednesday decided to invite the British Association to hold its meeting for 1886 or the following year in Manchester.

**The Manchester Architectural Association** opened its tenth session on Wednesday evening by a conversazione in the Memorial Hall. A number of drawings contributed by members of the Association were exhibited. There was a large attendance of members and their friends.

**The Value of Property** erected within the burgh of Greenock during the past year has been 95,000*l*., as compared with 87,000*l*. in 1882-83.

**The Blackpool Town Council** have resolved to recommend electricity as the motive power for the new tramways about to be laid on the promenade.

**The Esk Viaduct**, which carries the new line of the Scarborough and Whitby Railway over the river Esk, is practically completed. The viaduct, which is constructed of red brick, is 913 feet long and 125 feet high, with twelve piers and thirteen arches of an average span of 60 feet.

**The New Liverpool Waterworks** have cost during the past three months as follows:—The Llanwddyn embankment, 20,158*l*., or a total of 246,855*l*.; the quarry cost 9,281*l*. in the same period, or a total of 84,327*l*.; the aqueduct 32,178*l*., or a total of 519,957*l*.; and the land and easements 554*l*., or a total of 230,560*l*., making a grand total of 1,081,700*l*. 19s. 7d.

**The Construction** of the first street cable-tramway in Scotland is just about to be begun on the north side of Edinburgh, where the gradients are very steep. The continuous wire cable will be about six miles in length.

**Messrs. W. B. Wilkinson & Co.**, granite concrete paviors, of Newcastle and London, announce that Mr. W. D. Curzon, of 5 Westminster Chambers, S.W., who has been their agent for the last few months, is no longer a representative of their firm.

**Messrs. Archibald Smith & Stevens**, of Queen's Road, Battersea, have just completed a new hydraulic cylinder and crane for Southwark Wharf, Bankside. This forms another set of machinery worked in connection with the Hydraulic Power Company's mains.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, NOVEMBER 1, 1884.

### EDITORIAL NOTICES.

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested as much as possible to make their communications brief.*

*The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

### TENDERS, ETC.

\* \* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 3 p.m. on Thursdays.

\* \* Correspondents, when writing to notify an extension of time, or an alteration of the date of sending in Competitions or Contracts, are requested in their letter of advice to write at the head of the required change—  
“Contract Supplement to THE ARCHITECT.”

### COMPETITIONS OPEN.

**BOMBAY.**—Nov. 6.—The Municipal Commissioner of Bombay invites Designs and Estimates for a New Municipal Hall and Offices, which must be sent to his Office by Twelve noon, on Nov. 6. A Premium of 5,000 rs. will be given for the Design most approved of by the Commissioner, with the assistance of a Committee of the Corporation; 3,000 rs. for the second, and 2,000 rs. for the third. The total cost of the buildings is not to exceed 5 lacs (5,00,000 rs.). Mr. E. C. K. Ollivant, Municipal Commissioner's Office, Bombay, or at Messrs. E. W. & R. Oliver, 1 Corbet Court, Gracechurch Street, London.

**SOOTHILL.**—Nov. 6.—Plans are Required for a Board School proposed to be Erected in Gregory Street. Mr. J. D. Good, Market Place, Dewsbury.

GRUNDY'S PATENT  
WARM-AIR  
VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

TESTIMONIALS.

"9 Victoria Chambers, Westminster, S.W.

"June 10, 1884.

"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it.

"Yours, &c.

"JAMES WEIR, F.R.I.B.A.

"To Mr. Grundy."

"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square.

"February 15, 1884.

"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool,  
July 1884.

"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.

"Mr. John Grundy."

# BELL'S ASBESTOS.

## BELL'S ASBESTOS FLOORING FELT.

This article is manufactured from specially prepared Asbestos fibre, and by its use any building can be rendered comparatively fireproof at a very small cost. This material should be used as a substitute for brown paper under the carpet, and it can be taken up and relaid as often as required; it may be laid between the flooring boards, on the ceiling before plastering, and on the walls. Doors of pine or other wood should be so constructed as to have a sheet of the felt in the centre, so that either side being burned the other remains intact. In houses so protected fires would be localised to the rooms in which they originate. Asbestos felt, being a non-conductor of heat, is superior to any other sheathing, and used under slates has no equal. It yields no dust, lies quite flat, is soft to the tread, and its low cost places it within the reach of everybody. Made in rolls of 36 inches wide.

## BELL'S ASBESTOS BOILER AND PIPE COVERING COMPOSITION

for coating every class of steam pipe and boiler. Non-combustible, and easily applied when steam is up; adheres to metals and preserves them from rust; prevents the unequal expansion and contraction of boilers exposed to weather; covers 50 per cent. more surface than any other coating, and is absolutely indestructible. It can be stripped off after many years' use, mixed up again with 20 per cent. of the composition is supplied dry, and only requires to be mixed with water to the consistency required for use.

A horizontal boiler, 17 ft. 6 in. long, 15 H.P., gave the following results:—

Temperature on Plates .. .. .	186 deg.
“ “ Covering .. .. .	94 “

One ton of coal was saved per week, and, although the fire was raked out every evening 20 lbs. of steam were in the boiler next morning.

The following testimonial refers to this covering:—

Offices of Wimbledon Local Board, Wimbledon, Nov. 23rd, 1883.  
Dear Sir,—It may interest you to know that we save exactly 40 per cent. in fuel through using your covering.—Yours truly,  
W. SANTO CRIMP, C.E., F.G.S.

**BELL'S ASBESTOS PAINT**, for floors, stairs, and all interior woodwork, to prevent the spread of fire. This paint is especially useful in cotton mills, and in fact in all factories and buildings exposed to risk from fire. It is quite free from poisonous ingredients, and is both easily and cheaply applied. Bell's Asbestos Paint has, on several occasions, done great service in preventing the loss of life and property. The great fire in Buchanan Street, Glasgow, in November last, produced the following testimony to the value of this material:—

Offices of the *Glasgow Herald*, the *Weekly Herald*, and the *Evening Times*, Glasgow, Nov. 14th, 1883.  
Mr. John Bell,  
Sir,—As one of the means that helped to save our buildings extending from Buchanan Street to Mitchell Street from the recent great fire, I think it fair to say that your Asbestos Paint, which was applied to the outside hoist of the *Evening Times* case-room and other portions, gave valuable proof that it materially aided in resisting the flames from the immediately adjoining tenement while the fire was rapidly destroying it and threatening us in the most serious form. Since the fire, and to assure myself further of the value of the Asbestos Paint as a fire-resister, I placed a piece of wood, with your paint put on more correctly than in our case, into one of our furnaces, with the result that it was brought out without a fibre of the wood being touched, while similar pieces of wood, thrice coated with Irish Lime, at once got into a flame.—Yours truly,  
(Signed) ALEX. SINCLAIR.

**BELL'S ASBESTOS SASH-LINE CORD** is unaffected by heat and damp, and renders unnecessary the use of metallic wire and chains. Ropes made in the same form have great tensile strength, and being indestructible by fire are of incalculable value for fire escapes.

## BELL'S ASBESTOS.

The goods of this house are of the highest quality only, and no attempt is made to compete with other Manufacturers by the supply of inferior materials at low prices. All orders must be sent direct to the undermentioned depots, and not through agents or factors.

**BELL'S ASBESTOS AND INDIA-RUBBER WOVEN TAPE AND SHEETING** for making every class of steam and water joint. It can be bent by hand to the form required, without puckering, and is especially useful in making joints of man-hole and mud-hole doors on boilers; also for large "still" joints, where boiling fat and steam have to be resisted. It is kept in stock in rolls of 100 feet, from 1/4 in. to 3 in. wide, and any thickness from 1/4 in. upwards. Manhole covers can be lifted many times before the renewal of the jointing material is necessary. The same material is made up into sheets about 40 in. square, and each sheet bears the trade mark, without which none is genuine. It is very necessary to guard against imitations of this useful material, and to secure themselves against being supplied with these less useful articles at my price, users are recommended to see that every 10-ft. length of the Asbestos Tape purchased by them bears the trade mark.

**BELL'S ASBESTOS CEMENT** for the backing of firebricks and furnaces. The use of this fireproof material saves the expense and annoyance occasioned by the repairs so constantly required in the firebricks and kitchen ranges of private houses. Any labourer accustomed to handle other cements can apply this.

**BELL'S ASBESTOS BOILER PRESERVATIVE**.—This useful mixture, by absorbing the free oxygen that is in the water, entirely checks pitting and corrosion. It also disintegrates incrustation so immediately as to prevent its adhering to the plates. Not only is a great economy of fuel effected by keeping boilers clean, but the risk of having the plates burned is thereby obviated. It has been computed that 1-16th inch thick of incrustation causes a waste of 15 per cent. of coal; 1/4 inch thick, 60 per cent.; and 1/2 inch, 150 per cent. Thus the Preservative avoids the great risks which are inseparable from scaled plates, lengthens the life of a boiler, and covers its own cost a hundredfold by economy of fuel. It is entirely harmless, and has no injurious action on metals. It can be put into the feed tank or boiler, as may be most convenient. Sold in drums and casks bearing the trade mark, without which none is genuine.

**BELL'S PURE ASBESTOS CLOTH**, for protection against the spread of fire. Iron curtains warp, and in the great emergency of fire will often be immovable. Asbestos cloth, being incorruptible, will remain strong and flexible for an indefinite period, and will stay the progress of a fire and the passage of smoke longer than any other known material. This cloth is also extensively used in Maignen's unequalled water filters, for which a gold medal and diploma of honour were awarded by the Special Commission appointed by Her Majesty's Government to receive the reports of the International Juries at the Fisheries Exhibition. By special arrangement with Mr. Maignen, his filters for houses, factories, and towns are supplied by this firm.

**BELL'S ASBESTOS BLOCK GAS FIRES**.—The Asbestos Block Gas Fire is formed by placing inside the ordinary grate a hollow block (burner), composed of Asbestos, and perforated. An iron sole-plate, with a single gas burner, is fixed at the bottom of the block. After being lighted a short time, both the block and asbestos fuel throw out intense heat.

**BELL'S ASBESTOS FUEL** for gas fires. This genuine Asbestos Fuel is composed of the finest hand-picked Asbestos, and its weight is about half that of any other Asbestos fuel.

**BELL'S SPECIAL LONDON-MADE ASBESTOS MILLBOARD**, for dry steam joints, made of the best Asbestos fibre, is well-known for its toughness and purity, and is absolutely free from the injurious ingredients frequently used to obtain an appearance of finish, regardless of the real utility of the material. Made in sheets measuring about 40 in. square, from 1-64th in. to 1 in. and 1/2 millimetre to 25 millimetres thick. Each sheet bears the Trade Mark.

# The Architect.

## THE INSTITUTE OF ARCHITECTS: THE PRESIDENT'S ADDRESS.

NEW session of the Royal Institute of British Architects was opened last Monday evening with the usual presidential address. The meeting was well attended, and the presence of two distinguished visitors had been very appropriately secured as chief speakers upon the usual vote of thanks, namely, Mr. SHAW-LEFEVRE and MR. MITFORD, the First Commissioner, that is to say, of Her Majesty's Public Works, and the Secretary of the same department.

Mr. EWAN CHRISTIAN, as President for the year, may be said to represent two principles; privately he is one of the few survivors of the last generation of Gothic enthusiasts who are still in earnest; while publicly he is identified with the desire to administer professional affairs on liberal and perfectly sincere grounds, without any prejudice to his own Gothic feeling, of course, but without any compromise of his sense of impartial duty. Accordingly, on this occasion the assembly had the double pleasure of listening to a sound and sensible inaugural address upon the policy of the Institute, and hearing afterwards an excellent defence of the late Mr. STREET against whatever objections might be made, or might be supposed to be made, against the design of the Law Courts.

The defence of Mr. STREET came about in this way. Mr. SHAW-LEFEVRE, in a remarkably common-sensible speech which he made after the conclusion of the President's address, and in which he "turned a good many awkward corners" with great dexterity, happened to suggest a hope that the selection of the Classic style for the new Admiralty and War Offices would be acknowledged to fall in with the public taste of the moment, seeing that only four or five out of more than a hundred and twenty designs sent in by the profession at large were of a Gothic type. This led him to go on to observe that the Law Courts might perhaps prove to be the last effort of the Gothic revival, referring of course to its secular or municipal as distinguished from its ecclesiastical form. No one could blame Mr. CHRISTIAN for taking up such a challenge with all that remains now of the old militant spirit of his order. Cynics may probably say that the admissions he so frankly made to the disparagement of the arrangements of the edifice left only one thing more to be done to consummate the acknowledgment of its failure, and that his doubtful expression of a hope that some future generation might appreciate the merits which the present is too dull to discover was that one thing; but be this as it may, the latest apology for the Law Courts is at least a generous one, and an honest.

In dealing with the position and prospects of the Guild of Architecture of which he is for a time the official head, Mr. CHRISTIAN adopted a simple course. Just fifty years ago it was founded. The objects in view, as he well said, were excellently set forth and accounted for in the charter. As an instance of the carelessness and apathy which had since prevailed amongst men who ought to know better, he himself had never till now read that charter. But something at least had been done during the last half century in the way of a vague fulfilment of the founders' aspirations; and there was now being developed an intelligent desire to do a great deal more. Fifty years ago the provisions for academical study were of little account; libraries there were virtually none; there was no professional press; no publication of current designs; little indeed of professional fraternity; and still less of artistic liberty. Now there are Royal Academy classes, University classes; weekly newspapers rivalling each other in the profuse display of illustrations and the earnest discussion of affairs; libraries of value, and one of the very greatest value; prizes, medals, and travelling scholarships, whose practical utility it is not easy to overrate; almost too large a variety of professional societies; and withal an individualism of artistic merit and of style which may be called the boast of our generation and our country. The question then is what we are to do with all this; and the answer is that we have resting upon us a peculiar responsibility to do more than we appear to think.

Mr. CHRISTIAN is sanguine about the obligatory examination for the Associates of the Institute; indeed he is one of those who would extend the application of the test—under judicious restrictions, he is careful to say—to the Fellows. At the same time his fancy is not to be led away by the showy policy of ultra-academical education in France. In one word, he is a practical man. Pupilage, here and there so much contemned, he regards to be the strong point of our English system. In early youth the scholar of the art attaches himself to an acknowledged master, and grows up in the practical acquisition of his manner and the gradual discovery of his mysteries. He studies elsewhere in the abstract; at the Royal Academy, at college classes, in architectural societies, in the library, and in the press. In due time he travels, and of course sketches profusely; and then at length (for this is the worthy President's plain meaning) he enters upon a career of competition and fights his way to fame—to a happy combination, that is to say, of the airy trumpet and the substantial leg of mutton. There is one thing, however, adds the President in his kindly but candid way, which is essential to success upon this principle, and that is "genius." No doubt this is the fact, provided we put not too fine a value upon so fine a word. At any rate, most English architects of experience will for the present be disposed to believe that a good office may turn out a better architect than a good *atelier*, if everything else be only as it should be.

The ordinary meetings of the Institute, Mr. CHRISTIAN seems to think, are not sufficiently lively. He would have sprightly papers read by the younger men, and free and easy debate thereon especially encouraged. But in this he surely forgets himself a little in his excess of liberality. The aim of such an association—a Royal Institute of Architects—ought to be very different from this. It is not a debating club for young men at all; but an artistic and scientific or "learned" society, to which the very best men, in the plenitude of their skill and experience, are to bring from day to day the best of intelligence and ripest of wisdom, for consideration on the highest ground. Insufficiently as this great purpose may now be served, it is the sense of how it ought to be served that, as a rule, keeps the younger members silent. One can imagine them waiting with appreciative patience for better pabulum, even when they scarcely hope to receive it. The quaint regulation which is from time to time referred to for mere pecuniary purposes—that a new member is expected either to supply a paper or pay a donation to the library—is not only a shabby and sordid artifice, but, far more seriously, a perversion of intellectual principle.

Great reforms are in contemplation at the Institute. Amongst other demonstrations of a radical character, the Associates have been in some odd way encouraged to meet together and memorialise for "a share in the management of affairs." The Council, whose hair we nevertheless may suppose to stand on end, have set a special committee to work, in communication with the honorary solicitor, to reconsider the terms of the charter of WILLIAM THE FOURTH, and to entertain the idea of procuring a new charter. It was but the other day, as we noted at the time, that a recommendation to permit provincial Fellows merely to vote in writing was almost discourteously scouted by the Council; now it is proposed, not only that this should be allowed, but that the Associates as a body shall vote with the rest. Truly the times are changing; and perhaps it is not more than the strict truth to suggest that as the times change the Presidential influences change. Revolution, Mr. CHRISTIAN tells us, he detests, but judicious reform he favours to the utmost. It is high time, at any rate, that such sentiments should be expressed, and, if possible, acted upon. But one question, easily asked, and as we think no less easily answered, is this:—If the spirit instead of the letter of the old charter were acted upon, what need would there be for a new one? It is not the law that is wrong, but the new-fangled way of interpreting it.

The recent competition of designs for the Offices of War and Admiralty was made the subject of anxious explanations, not only by Mr. CHRISTIAN, as one of the adjudicators, but still more by the First Commissioner of Works, following him. The remarkable success achieved by "two young men, unknown to fame, who have scarcely ever been away from a small town in Yorkshire," was made much of. The determination to entrust to their professional charge a great national building was spoken of with confidence. The other young men at the back of the meeting-room cheered vociferously, and

their elders more in front had to join in the applause, if only for chivalry's sake. But, chivalry apart, what does this mean? It simply means that everybody is to rejoice because a great prize is won unexpectedly. Lotteries are illegal in England, and this is one of the many ways in which the love of hazard, native in all lands, delights therefore to find exercise. Far be it from us to grudge to Messrs. LEEMING personally the success they have so suddenly attained, but does not this very success itself illustrate the practical futility of architectural competitions? If Mr. NORMAN SHAW or Mr. WATERHOUSE had been the successful competitor, as Sir GILBERT SCOTT used to be, nothing would have persuaded the less thoughtful mass of the profession—and, indeed, of the outside public—to be satisfied with so unromantic a result; but if it had been Mr. NORMAN SHAW's clerk, or Mr. WATERHOUSE's pupil, or a schoolboy from the South Kensington Art Classes, the whole country would have rung with generous but foolish acclamations. The recent competition, says Mr. CHRISTIAN, is shown by its outcome to have been "absolutely and entirely fair." So be it; but there is this at least to be said:—If architectural skill is no better than a thing in which unpractised youth can enter the lists with age and experience of the best, and beat them hollow, then it is a pity it is not something in which such a catastrophe would be as impossible as it is in other professions. But, says Mr. CHRISTIAN, such competition is "inevitable in this age." Perhaps it is; but the rejoinder of many prudent persons in all walks of life will be—The more's the pity.

#### AUTUMN EXHIBITIONS.

THE fall of the leaf is again the signal for that show of pictures in some half-dozen galleries which greet the visitor with sights and associations of all seasons, under the magic sway of art, independent of changeful time. In the region of Pall Mall Messrs. WALLIS at the French Gallery, Messrs. McLEAN and A. TOOTH in the Haymarket, present an admixture of foreign and English productions as usual. A point is made at the French Gallery of the landscape of CARL HEFFNER, who has been commissioned by Messrs. WALLIS to paint a series of large compositions from Southern Italy. These, with a number of his delightful small sketches, fill the entirety of the long wall. HEFFNER has brought his Northern temperament into contact with the Southern sun, and it has remained unwarmed. These impressive tableaux of grand desolation, on the Appian Way, at Ostia, in the Campagna before the aqueduct of CLAUDIUS, at Baïæ, beside the Temple of VENUS—poetic, studious, scenic, as they are—differ no whit in tonality from the humid, chilly brilliance of those pictures of marsh pools and shaggy moorland and stretches of luminous shallow water, for which the artist has taught us to look with expectant pleasure. The skies, always a strong feature in the painter's programme, are here less eventful than usual, with the exception of that mustering in clouds over the Place of Tombs on the Via Appia. There is a fine passage in this picture, where the mass of pine and cypress foliage strikes the sky, and a low line of silver light runs quivering along the level horizon under the lifted cloud-curtain.

Probably, if translated into black and white, the moon-rise at Ostia, called *Desolation*, would come out the best in composition and balance, and the engraver might add a touch of texture and solidity to the pillars of JUPITER's temple which is wanting to all HEFFNER's treatment of masonry. The beautiful detail put into the distance in the large study on the Campagna is lost from the point of view at which the picture tells best as a whole. It is in management on points like this that the clever artist shows a lack of technical training. On the whole, we think that this Bohemian painter has been moved but not filled with the peculiar characteristics of Italian scenery. He has sought for aspects which had appealed to him, and which he has learnt poetically to portray under other skies, and his brush has obeyed the unconscious impulse of the mind to impress the old stamp on the new mould.

It is in this gallery that one meets with the masterly works of the Viennese Professor L. C. MÜLLER, and *Tric-trac Players in a Cairene Café* is one of his consummate studies. A certain artificiality of tone, and a lack of texture in the draperies out of keeping with the realistic treatment of the subject must be looked for, but the drawing and grouping of the figures are beyond praise for character, precision, and

picturesque appeal. The study of the young, long-robed attendant, superintending with Oriental dignity the boiling of his coffee-pots on a stone stove, is a complete picture by itself, delicious in colour.

Herr BRANDT, the Hungarian, is a famous man, and especially renowned for wild scenes of local custom, wherein horses and brilliantly-costumed figures are thrown together in a *mêlée* of violent action, after what might be called a learned hazardous fashion. *The Horse Fair in Bessarabia* is such an opportunity for displaying the painter's power, his abrupt, rather ragged, but masterly touch, command over difficult material. Perhaps he has not in this large canvas brought his separate and many groups so well together as sometimes; but very few men could give cohesion and a definite impression to this confusion over an extended perspective of struggling animals and gesticulating men, strange booths and sheds covered with fluttering draperies and thatch, gaunt windmills, and bare poles. The colour is a general tone of dusky browns and greys, upon which scintillate flicks and spots of brilliance.

A fresh incident of rustic life by Mr. W. H. BARTLETT, called *A Cornish Drying-ground*; further, an old canvas dating from the days when Mr. FRANK HOLL, A.R.A., painted pathetic *genre* on a large scale with dull tone and obvious means, *Want—her last Resource*, a married girl, with baby on her breast, pawning her wedding-ring; also a study of an *Oriental Water-Carrier*, in the romantic manner of the late A. ELMORE, R.A., are notable English pictures.

In the miniature *genre* for which the gallery has always been known, the exquisite bits by C. SEILER and ALLAN-SCHMIDT should be looked out. A decorative composition, in which the warm olive tints of a girl's skin, her blue drapery and the blue distant landscape, a red water-jug, the pearly whites of a fountain and open portico, and the silver white of blossoming trees, form a delicious if artificial scheme of colour, is by a Professor at Düsseldorf—not at Paris, despite of appearances—by name C. WÜNNENBERG.

Mr. McLEAN has gathered a brilliant and various roomful of Continental and British easel pictures. Among the former, the Spanish scenes by B. GALOFRE, busy, scintillating, full of *chic*, are very notable in the school of FORTUNY. Mr. BOUGHTON, R.A., is interesting and characteristic in the *Going to Church* of his young New England couple, mid brown leaves and snow; and yet more in the capital interior, with the incident of stalwart *Wouter van Twiller's Judgment*. Charming and fresh is an English girl, fair and slim in white draperies, standing at a window, entitled *The Betrothal*, a piece of gentle grace not altogether after the usual fashion of Mr. R. MACBETH's rather aggressive picturesqueness.

But the "feature" of the gallery is of course the exhibition of the three pictures of children, painted for Mr. WERTHEIMER by Mr. MILLAIS, R.A., and noted by us in our columns on the spring studios. *Little Miss Muffet* is to be engraved by Mr. ATKINSON, and must inevitably be a most popular print, although black and white cannot give the charm of her wonder-stricken blue eyes and sweet flesh tints. The Normandy fisherman child, who reads a *Message from the Sea* she has found in the bottle washed up on the strand, is pleasanter and more interesting than the young *Mistletoe Gatherer* in the snow. Both pictures have, of course, the painter's vigorous ease, and, be it said, some technical deliberation also.

The interest of Mr. TOOTH's exhibition, in so far as foreign art is concerned, rests much with the pictures of M. L'HERMITTE, who is not seen so often as a colourist as in the charcoal drawing for which he stands absolutely in the first rank. In these MILLET-like rustic subjects, the *Midday Rest* and *Harvest*, the artist grasps his subject matter in sterner manner than is his wont, but brings charm of atmosphere and significant intention to beautify and to ennoble. His oil technique is less happy than in coal or wash. The brilliant palette of LUIS JIMENEZ is in full sport in his *Competitions* at a flower show. VAN HAANEN and LEPAGE, and other men of note are represented, also the English sea painters BRETT and HOOK.

The Dudley Gallery Art Society, and the Nineteenth Century Art Society, are founded to meet the necessity of exhibitors whose productions outrun in quantity the capacities of the many galleries already in existence. The second named is supposed especially to encourage juvenile talent, and in so far as it is helpful (and the committee put forth a promising statement) one must wish the Society success. The

show of pictures is not enlivening, however. We noted for commendation in figures Mr. GOTCH, Mr. GUARDABASSI, Mr. YEEND KING (not a tyro), in outdoor *genre* Mr. ALFRED CONQUEST, in landscape pure STUART LLOYD, W. SIDNEY COOPER, of course not to the exclusion of others. Among the water-colours, clever Oriental studies by G. LEKEQUIAN, a bit of Swedish figure subject by LEON ZORN, the architectural essays of SOPHIE D'OUSELEY, again the landscape of Mr. LLOYD, and again an interior, this time with piquant French LOUIS QUINZE costumes, by YEEND KING.

At the Dudley Gallery certain assured artists are members, of whom some care to send, Mr. EDWIN ELLIS, for example; while others are conspicuous by absence. It would be unfair to miss noting the very great advance shown in the *News from the Sea*, by Mr. GOTCH, a picture of incident, with figures talking at the door of a house above the quay, while the wind blows furious up a narrow passage and fills the air with drift of foam and rain in the distance, where rows of watching figures tell the tale of ships struggling in an angry sea. HILDA MONTALBA'S Venetian sketches are pleasant if blurred images, very true in colour. A picturesque view, with children of *Truant Disposition*, loitering on way to school, by W. G. DAFFARN, has much promise and some performance; it is dainty in execution and picturesquely planned. Mr. BLOMFIELD shows vigour in single-figure studies. ALICE MILLER has looked at Mr. CLAUSEN'S work to good purpose before painting the strong girl's head—*Troubled Thoughts*. The exhibition, as a whole, can hardly be considered to rank as an indispensable event in the art season, but people who have much leisure will find ground on which to spend it pleasantly in this gallery.

### CAST IRON IN BUILDINGS.

IF any building material can be said to have fallen under a cloud it is cast iron. Unless in the form of columns and stanchions it is seldom used, or only when no material can be substituted. Cast iron is supposed to be treacherous, uncertain, incapable of sustaining tensile strains, liable to flaws which are concealed from all eyes, and equally puzzling to operators in the blast furnace and the foundry. How many of its defects arise from imagination may not at first sight be apparent. Constructive science is not without its prejudices, and a good many of them surround cast iron. Why that material should be slighted is easily explained. At the time when exceptionally large railway bridges were projected, a Royal Commission was appointed to inquire into the use of cast iron and wrought iron for the purpose. The risks arising from the vibration of cast iron caused by the constant passing of trains, and from the occasional derailment of a locomotive or a line of carriages, were considered, and it was supposed that cast iron in those contingencies was less suitable than wrought iron. The Britannia Bridge, on the other hand, made it plain that an immense structure could be constructed of plates and angle-irons with as much ease as a house was built of bricks, and of a strength that was equal to every reasonable test. The engineers of that bridge, STEPHENSON, FAIRBAIRN, HODGKINSON, and CLARK, became, as it were, the lawgivers on iron construction, and as they were supposed to be in favour of wrought iron exclusively, it was made the favoured material. A little inquiry would have shown that STEPHENSON, who was the chief among them, had no partialities. If he used wrought iron to cross the Menai Straits, in a no less remarkable work, the High-Level Bridge at Newcastle-on-Tyne, he gave the preference to cast iron. FAIRBAIRN, however, found it more convenient to undertake contracts for wrought-iron girders, and, as he was a rather productive writer, his literary influence was widespread, and was employed in advocacy of the material. Wrought iron was also supposed to offer more facility for designing new types of bridges, and in consequence a great many engineers were attracted by it. During the last thirty years very few cast-iron bridges of any importance have been erected in England, while the varieties of those in wrought iron are almost countless.

FAIRBAIRN was better known as a practical engineer in connection with mills than with railways, and as soon as, by a piece of sharp practice, he had patented a rivetted girder, he was able to introduce a great many of them into buildings. About the same time another influence came into operation against cast iron. In 1846 the carpenters of Paris organised a general strike, and architects and builders were in consequence

compelled to substitute iron for wood in floors and roofs. Various sections of rolled girders were tried, and eventually the I girder was evolved. The employment of one with a bearing of 18 feet in a house in the Boulevard des Filles du Calvaire, in Paris, about 1849, was among the most memorable events in the history of modern building construction, and cast-iron beams were henceforth superseded. They had been in use from 1801, when BOULTON & WATT arranged the ironwork for PHILLIPS & LEES' mill in Manchester.

There is no denying the convenience and advantages of wrought iron, whether in the form of rolled joists or rivetted girders. But let us be just to beams in the other material. When cast iron lost its position little was alleged about deficient strength or liability to collapse through invisible flaws. The experiments on it produced remarkable results. Thus, for example, it was ascertained by the Royal Commission on the Application of Iron to Railway Structures that when cast-iron bars were exposed to successive transverse blows, each blow producing one-third of the ultimate deflection (or deflection immediately before breaking), they bore four thousand such blows without having their strength impaired. It was likewise found that when bars of cast iron were exposed to successive deflections by means of a revolving cam, they bore one hundred thousand such deflections without any impairment of strength. These figures show that cast iron does not so readily succumb even under variable loads, which are frequently applied and removed.

The bridges which were constructed in days when wrought iron was not recognised as a building material are also evidence of the endurance of cast iron. The Coalbrookdale Bridge over the Severn, designed by ABRAHAM DERBY, was constructed in 1777. TELFORD'S bridge, near it, at Buildwas, was finished about twenty years afterwards, and his Waterloo Bridge at Bettws-y-Coed in 1815. The big Sunderland bridge, 236 feet span, dates from 1796, and bids fair to last long, although it is only the work of an amateur engineer. It was designed by the rebellious staymaker, TOM PAINE, and was originally put together at the Yorkshire Stingo in Lisson Grove. Southwark Bridge has sustained the wear and tear of metropolitan traffic from 1819. All those bridges are in positions which are exceptionally trying, and their existence is a refutation of the suspicions which some people have entertained respecting the strength of cast iron. If the material can withstand the variety of loads which pass over Southwark Bridge, and all variations of atmospheric condition, there need be no fear about its security within a building.

With such precedents, the Corporation of Middlesbrough may have full confidence in the fitness of cast iron to support the floor of their great hall, no matter how crowded it may be. Nevertheless a good deal of credit is to be given to Mr. HOSKINS for the experiment, which has been so well carried out by Messrs. DENNETT & INGLE. It would have been possible to have used wrought-iron beams for the purpose, but apart from questions of expense and headway, the appearance of the room must have been very different. Experience has shown that it is almost impossible to give an architectural character to rivetted or rolled girders. The utmost that can be done is to decorate them with painted ornament, or to perforate the web-plate with patterns. But cast iron is more tractable and lends itself to design. There is of course a risk that it can be made into forms which are more applicable to wood or stone, but in good hands there need be no want of fitness in the ornamentation. The material has been so little used, it is not surprising that occasionally there should be a doubt about the artistic treatment that is most appropriate to it. The late OWEN JONES did a good deal towards the creation of a style that was adapted to cast iron. He seemed to keep in view the crystalline nature of the material as a fundamental idea, and to have restricted himself to geometrical patterns which would be in keeping with extreme rigidity and power to resist compression. On the other hand, there are structures of cast iron which are so profusely ornamented with imitations of carving as to suggest only the ease with which the metal can be melted and run into moulds. The spandrels of railway bridges might be cited as examples which show that more was thought of the flowing curves of the "filling in" than of lines which might express construction.

It is not to be inferred from what we have said that we propose a substitution of cast for wrought iron in buildings. All we venture to imply is that both kinds of girders have their

uses, and that by restricting himself to horizontal beams in wrought iron the architect very often adds to his difficulties in his endeavours to produce effect; while cases often arise, like the Middlesbrough Town Hall, where cast iron demands a preference before all other materials.

### THE RIGHT TO THE ELGIN MARBLES.

THE evidence which was given by Mr. Newton in the treasure trove case in the Thames Police Court, appears to indicate that there are doubts about the title to property in the sculpture of the Parthenon, now in the British Museum. It is not impossible hereafter that a claim may arise for the restoration of the works, and that it may be made a subject of international adjudication. That England bought the sculpture from Lord Elgin for 35,000*l.* is plain, but whether it would be possible to satisfy a council of lawyers about the rights of the vendor is another matter. His lordship's account of the acquisition would not, it is to be feared, be in accordance with the strictest notions of equity. His ownership was the subject of investigation by a Parliamentary Committee, and in the end appears to have been taken on trust. Other nations have been enriched by artistic spoils, but England and Bavaria stand apart as purchasers of sculpture which was torn from the walls of temples. In order that a couple of galleries might be made more attractive two buildings must for ever lose the treasures which gave them character. It is not surprising that among Lord Elgin's contemporaries there were many who condemned his energy in bringing the marbles to England. Byron probably expressed what was a very general opinion in those days when he said that a man "adores the plunder, but abhors the thief." The question we have now to consider is whether the removal of the statues was plunder, for, if so, one's enjoyment of the Parthenon Room in the British Museum cannot be unalloyed. The history of the transaction must accordingly be given.

The Earl of Elgin was appointed ambassador to the Ottoman Porte in 1799. Before he left England his lordship appears to have entertained a belief that he could do something for the arts while absent. He consulted Thomas Harrison, the architect who designed the single span bridge over the Dee, St. Nicholas' Tower, Liverpool, and Lord Elgin's house at Broomhall. Harrison had lived for a few years in Rome, and his opinion was that drawings, however accurate, could not take the place of casts as a means of artistic education. Lord Elgin thereupon endeavoured to persuade the Government to appoint a staff of modellers, draughtsmen, and architects to produce copies and drawings of Greek work, but the ministers were afraid of the expense. His lordship was too poor to undertake the cost of engaging English artists, but in Italy he secured the services of Tita Lusieri, who was described by Byron as a painter of the first eminence; Signor Balestra, an architect, and an assistant named Ittar, together with a Calmuck figure-draughtsman and a couple of modellers. Permission was obtained for the artists to establish themselves in Athens, and for three years they were engaged on casts and drawings, Lusieri being the superintendent. The firman was drawn up during the absence of the Grand Vizier from Constantinople. This document is addressed to the *cadi*, or chief judge, and the *vaivode*, or governor, of Athens. As it forms the title-deed to the sculpture, it will be well to give the most important passage:—

He (Lord Elgin) hath also at this time expressly besought us that an official letter may be written from hence ordering that as long as the said painters shall be employed in going in and out of the said citadel of Athens, which is the place of their occupations, and in fixing scaffolding round the ancient Temple of the Idols (Parthenon), and in moulding the ornamental sculpture and visible figures thereon in plaster or gypsum, and in measuring the remains of other old ruined buildings there, and in excavating foundations when they find it necessary, in order to discover inscriptions which may have been covered in the rubbish, that no interruption may be given them, nor any obstacle thrown in their way by the *disdar* (or commander of the citadel) or any other person, that no one may meddle with the scaffolding or implements they may require in their works, and that when they wish to take away any pieces of stone with old inscriptions or figures thereon that no opposition may be made thereto.

It is evident that the pasha who drew up the firman did not contemplate any other work being done than the taking of casts of the sculpture. The "pieces of stone" must have meant something very different from the great frieze, the metopes, and the pedimental figures. Lord Elgin maintained that the firman was only expressed in general terms, because it was well understood

that a permission issuing from the Porte for any of the distant provinces was little better than an authority to make a bargain with the local authorities. A similar permission was given to other explorers, but from want of means they were unable to operate on the judges and governors. How far the statements are accurate it is now impossible to determine. Lord Elgin admitted that his original plan was to bring away nothing but casts, and the meaning of the firman as an authority to model and measure becomes clear. Afterwards, on seeing the indifference of the Turks to the sculpture, statues being sometimes converted into mortar, his lordship's intentions were altered, and a very liberal interpretation was given to the word "removal" in the firman. It is remarkable that no official information was given by Lord Elgin to the Turkish Government respecting the extent of his devastation. "The chance is," he said, "that I have done it five hundred times, but I cannot answer specifically when or how." A more extraordinary statement was never uttered by a diplomatist, unless it was when Lord Elgin said that he could not decide whether the permission was given to him in his capacity of ambassador or as a private collector. The terms of the bargain with the officials have never been known. Lord Elgin's agent said he was unable to conjecture the amount of the bribes, but he admitted the presentation to the *vaivode* of cut-glass lustres, firearms, and other articles of English manufacture.

From what we have said it will be seen that the entire transaction is surrounded by the indefiniteness which is always dangerous in a law case, and an ordinary tribunal would probably hesitate to accept the title on which England holds the sculpture. The English ambassador obtained privileges from the Grand Porte, which he chose to interpret as being a concession to Lord Elgin, the connoisseur. The Turkish officials at Athens were influenced by means of bribes in money and gimcrackery, and in consequence did not interfere. The high authorities in Constantinople, after the manner of an English circumlocution office, declined to know anything of the operations, as they had received no official information. It was easy for the Earl of Elgin, under those circumstances, to remove as much sculpture as he cared to possess. The real difficulties were those attending the voyage to England.

### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE first ordinary meeting of the Institute was held on Monday evening, the President, Mr. Ewan Christian, in the chair.

#### Obituary.

The decease was announced of Mr. John Holloway Sanders, of Derby, on the 16th ult., in the 59th year of his age, elected a Fellow of the Institute in 1872. The death was also announced of the French architect, M. Paul Abadie, Hon. Corresponding Member of the Institute. This gentleman became an Architect Academician in 1875. He was Inspector-General of Diocesan Edifices, member of the Commission of Historical Monuments, and architect of numerous churches in Bordeaux, Angoulême, and Périgueux, and architect of the church of the Sacred Heart, Montmartre, Paris, chosen in the International Competition for that work.

#### Donations.

Professor Meldahl, rector of the Academy of Copenhagen, sent a folio work on 'Mediaeval churches and other historical monuments in Denmark.' Herr Schneider, of Berlin, the third part of his illustrated work on the "Decoration of Interiors," a work begun by the late Herr Gropius, Corresponding Member of the Institute. M. Ruprich Robert, the second part of his new work on Norman architecture. Other donations were also announced, and among them drawings and designs of the late Viollet le Duc reproduced in facsimile. M. Lucas sent a pamphlet with the proposed rules for an association of architects for the defence of professional interests in matters such as responsibility of architects, public competitions, artistic copyright, &c., an association the president of which was M. Questel, Senior Architect-Academician. It was proposed to establish a fund for affording pecuniary assistance in judicial and administrative cases.

On the motion of the President a cordial vote of thanks was awarded to the donors.

Professor Raschdorf paid a visit to this country during the recess. He was about to erect a new English church at Berlin, and the Crown Princess of Germany, the Princess Royal, sent a request that he might be assisted in his inquiries in London by some of our English architects. Accordingly the President, Mr. Gruning, Mr. William Simpson, and others accompanied in his various visits of inspection.

**Studentships and Scholarships.**

Mr. F. R. Farrow, the holder of the Godwin Bursary, had been kindly received in Vienna, and the objects of his visit forwarded by Herr Leonhardt, secretary of the Guild of Architects, and others, and among them Baron von Hausen, son of the late Baron von Ferstel, and Herr Schmidt, gold medallist of the Institute, who gave him every facility to study points of construction in some of the new barracks and a hospital.

The hon. secretary intimated that it had been decided that the Pugin prize should be accompanied by a medal, by way of giving the winner an enduring memorial of the honour he had taken, and the medal was in course of preparation. The Council thought it would add to the prestige of the Godwin Bursary if a medal were given with that also. Mr. Godwin had notified his acquiescence, and sent a cheque as his subscription towards the cost of preparing the die, and the amount of the donation would go a long way towards defraying the cost of the medal.

Miss Hannah Jane Jones, the only surviving relation of the late Owen Jones, had intimated her desire to establish a scholarship, the special object of which would be to enable the holder to travel in Europe and elsewhere for the cultivation and improvement of his knowledge of architecture, the scholarship to be tenable for two years, and to be designated the Owen Jones Travelling Scholarship; the nomination to be in the hands of the Council of the Institute, and the nominee to be a present or former pupil of some member of the Institute, or of the Professor of Architecture in University College, London, or Birmingham and Midland Institute, and to be deemed eligible by reason of his proficiency in the leading subjects treated of by Owen Jones in his "Grammar of Ornament."

On the motion of the PRESIDENT, a hearty vote of thanks was given by acclamation to Mr. Godwin and Miss Jones.

**Memorial of the Associates.**

Mr. RICHARDS JULIAN read and presented a memorial signed by the Associates to the following effect:—"We, the undersigned Associates of the Royal Institute of British Architects, desire respectfully to direct your attention to the fact that, although professional members, Associates under the existing charter and by-laws are debarred from taking any part in the affairs of the Institute, and to urge the following considerations:—Every step which renders our Institute more truly representative will add to its influence and popularity, and any change which improves the position of the Associates will add to the dignity of Fellowship. Moreover, the authority of the Council will be enhanced by making the electing body consist of all the professional members. It should be borne in mind that at present the Associates subscribe about one-half of the total amount contributed by professional members, and yet have no control over the expenditure. A large number of the Associates are actively engaged as principals, and are therefore equally interested with the Fellows in questions of professional practice. In the Institution of Civil Engineers, and in the Surveyors' Institution, professional Associates vote on the same terms as Fellows, and in these kindred societies the practice is found to work satisfactorily. We therefore most strongly urge you to determine the best method of giving to professional Associates the right of voting on all matters relating to the regulation of the affairs of the Institute, and suggest in the interest of country Associates that the votes be recorded by means of voting papers transmissible by post."

The memorial was signed by 453 Associates—viz., by 308 in London, and by 145 in other parts of the United Kingdom; and Mr. Julian explained that last year's list contained the names of 685 Associates, since which 25 had been elected, making in all 710. Of this number five had ceased to be Associates, some others were abroad, or had no address, and deducting these to the number of forty-five, 665 copies of the memorial were sent out. Some of these were returned through the dead-letter office, eleven for various reasons, not, however, because they did not sympathise with the objects of the memorial, declined to sign, and this left 90, from whom no reply had been received.

The PRESIDENT replied that it gave him great pleasure to receive the memorial, which should be laid before the Council at as early a date as possible. He sympathised with the wishes expressed by the Associates, but he would not anticipate what he had to say on the point in the address he was about to read.

**New Members.**

Mr. Josiah Conder and Mr. George Rackstraw Crickmay were elected Fellows, and Mr. Charles Harvey Henrich Cazalet was elected an Associate.

**The President's Address.**

The PRESIDENT then delivered the address, which will be found in another part of *The Architect*.

Mr. MITFORD, hon. member, and Secretary of Her Majesty's Office of Works, moved a vote of thanks to the President for his address, saying that owing to the absence of a more worthy member the task had fallen to him of asking them to thank their President for his extremely interesting and remarkable address. It was evident that they were to be congratulated on the flourish-

ing state of their affairs. The statements made by the secretaries showed that the Institute had a very long arm, and that men came to them from every quarter of the globe for their certificate fellowship. For a young institution, only just reaching its jubilee, it was no mean measure of success. There had been also read a long list of benefactions showing that men appreciated them, and were ready to back their appreciation in a solid way. The admittance of new members proved the Institute was alive. The examination for admittance was no dead letter, for the honour was obtained only by labour, and that of a most severe kind. The Institute might now indeed be said to confer a degree of an academical character. As to competitions, especially the recent great competition for the Admiralty and War Offices, alluded to by the President, perhaps he might be allowed to say it was a matter of great satisfaction to him to hear the well-deserved and graceful compliment paid to the young architects who had so suddenly and so unexpectedly come to the front as the winners. Mr. Mitford concluded his remarks by alluding to the satisfactory relations of the Office of Works with the Institute.

Mr. SHAW-LEFEVRE, First Commissioner of Works, spoke of the services rendered by the President of the Institute and Mr. Hardwick to the Government when acting as judges in the competition. Few, he said, knew the labour and the conscientious zeal they brought to the task of adjudicating in so important a matter. The competition had involved two novelties. In the first place, in previous competitions for public buildings architects had been asked to act as assessors, but not as judges. On the present occasion two eminent architects, the President and Mr. Hardwick, in connection with the Chancellor of the Exchequer, Mr. W. H. Smith, and himself, had acted as judges, and in this respect they would, he thought, agree that a proper and due position had been accorded to the profession. In the second place, it was the first example of a Government competition taking the form of a double competition—the first open to all the world but strictly limited in its nature—that was to say, to sketch designs from which a limited number were selected for a competition of a more elaborate character. The profession responded freely to the invitation, and no less than 128 designs were sent in, which were of a fairly representative character, and included a certain number of the most eminent architects in the profession, and the result of the competition was in itself a voucher for the complete fairness with which it had been conducted. No one was more surprised than they were themselves when they came to see the names of those whose designs they had selected. A primary condition was, he need hardly point out, that the buildings should answer the purposes they were intended to serve, and that the plan interiorly should not be sacrificed for exterior effect, and he might add that many who failed, failed on this account, and of course could not be recommended for the second trial. As to style, out of the 128 designs submitted, not more than five, perhaps only three, were Gothic. The rest were Classic designs, either of the more severe Classic, or various forms of the Renaissance. One was designed in the more recent style, which went by the name of Queen Anne. It was a significant sign of the change in public opinion, that in previous competitions, as for the Home and India Offices, more than half the designs were Gothic; and again, in the limited competition for the Law Courts, the greater number of designs were Gothic, and in both cases a Gothic design was successful. They might then conclude that it was a principle generally accepted by the profession that to answer the purpose intended and harmonise with the surroundings, Classic style was more suitable than Gothic for the new offices. The verdict of the judges had, on the whole, been approved of by the profession and by the public. It was the intention of the Government, in the coming session, to submit a vote to Parliament to employ Messrs. Leeming to carry out the work. In the meantime those gentlemen were occupied in perfecting as much as possible their design, partly in deference to suggestions from the authorities, partly from the criticisms they had received elsewhere. Speaking of Westminster Hall, he said it had been his duty to clear away the old courts which had hidden the west front of the Hall, and when that was finished there came the question of what should next be done, and he bethought himself of taking advice of the architect most competent in that kind of work, and plans were now before the public, prepared by Mr. Pearson, suggesting a restoration of the work as it was in the time of Richard II. to the beginning of this century, when the courts were added to it. This involved the building of a double-storeyed cloister against the west front of the Hall, by which it would be possible to preserve the old Norman wall which was full of antiquarian interest, having the marks of the Norman workmen still upon it. Whereas if the front were left exposed to the weather, the atmosphere of London would take effect, and it would be necessary to reface the wall and absolutely and for ever to conceal the old Norman masonry. Differences of opinion as to the expediency of the work had been expressed, and as they had been expressed also in the House of Commons, the question would be brought forward in Parliament, and it would then be possible for any one to challenge the opinions of the Committee. Another important work was being carried on at the Tower of London. This was a work of demolition and of restoration, first, in the removal of hideous warehouses and structures which had so long intercepted the view

of the Tower from the river, and secondly, in the restoration of the inner ballium wall and the Lanthorn Tower. One block of warehouses had now been demolished, and a part of the ballium wall rebuilt. He hoped to begin the other half of the work in a few days. The work, he thought it right to say, had been carried out by Mr. Taylor, of the Office of Works, who was a member of the Institute, and of whose ability and the high services he had rendered to the Government Mr. Shaw-Lefevre could not speak in too high terms. These works were, he thought they would agree, of no small importance. There was, he believed, no other city in Europe like London, where there was to be found so long and unbroken a series of great buildings, showing every phase that architecture had passed through, from the Norman work as seen in the old Norman fortress of the Tower, the Norman Hall at Westminster, the beautiful Abbey, illustrating Gothic ecclesiastical work from Henry III. to Henry VII., the Tudor domestic work of Holland House and Charlton, the Renaissance work of Inigo Jones, the masterpieces of Wren and his successors, down to Sir Charles Barry and Mr. Street, in whom we had possibly the end of the Gothic revival—in secular buildings at any rate, for he thought it possible that it might still flourish in ecclesiastical buildings. No one could venture to say what the style of our buildings would be, even in the immediate future. That style was not due merely to architects, but to the taste, or the want of taste, and the requirements of the public. Public opinion compelled Sir Charles Barry to adopt the Gothic style for the Houses of Parliament against his own conviction; and again it was public opinion, in the person of Lord Palmerston, that forced Sir Gilbert Scott to abandon his Gothic design for the Home Office, and to erect a Classic building. Public taste was itself the result of influences so subtle and numerous that it was impossible to analyse. Though the profession had suffered severe losses of late years by the deaths of so many of its prominent members, he believed it held within its ranks men who were able to carry on the great traditions of English architecture, and who would leave behind them memorials as beautiful and as valuable as those we had had left us in the past.

MR. CHARLES BARRY seconded the vote of thanks to the President. The architect's duty, he said, was with the present essentially, with the past historically, and perhaps uselessly with the future. In devoting themselves to their art they hoped to earn the praise of posterity even as they were ready to accord it to the past. In reference to Mr. Shaw-Lefevre and Mr. Mitford paying them the compliment of being present that evening, he said he believed those gentlemen, with the profession, were to be felicitated in regard of the fairest competition that had ever been conducted.

The PRESIDENT in acknowledging the thanks of the meeting, said he did not agree with Mr. Lefevre that the Gothic style showed signs of dying. That gentleman, however, would agree with him, that if a plan had been found equal in merit to that selected, with a fine Gothic elevation, it would have received the greatest consideration. He hoped those who had taken up the study of Gothic thoroughly, and could design with freedom and treat it as it ought to be treated, would not let themselves be deterred from its practice by what the First Commissioner of Works had said. Than Mr. Street no man was more thorough in planning. That there were faults in his Law Courts was no fault of Mr. Street, but it was the fault of those who bound him in chains of instructions which he could not burst. It was not Mr. Street's fault that the noble hall of the Law Courts was rendered useless, for, in obedience to the most exact instructions, the hall was divorced from the Courts. This, and other defects in the noble pile of buildings, were not due to the great master, but to those who fettered him with instructions. A nobler front than that of the Law Courts could not be found. After-generations would call it a noble building and an honour to the century in which it was erected.

The proceedings then terminated.

#### EDINBURGH ARCHITECTURAL ASSOCIATION.

THE opening meeting of the current session of the Edinburgh Architectural Association was held on Monday, Mr. David McGibbon, President, in the chair. Mr. T. Fairbairn, the hon. secretary, read the secretary's report for the past year. The Council, it stated, were much gratified in reporting that the past session not only was the most useful in the history of the Association, but also was one that held out abundant promise for its future development. The Council, during the session, felt it their duty to memorialise Her Majesty's Government in regard to the present state of the hall in Edinburgh Castle, and attention has been promised on the part of the Government to the subject. The report referred with satisfaction to the work in progress of repairing Craigmillar Castle by the proprietor, which would be of great value in tending to preserve what remained of a building rich in architectural features and historical associations. The Association was again placed under obligation to Professor Baldwin Brown, who had obtained an ordinance from the University Court, to the

effect that members of the Edinburgh Architectural Association be permitted to attend the fine art class next session on payment of a very modified fee. The membership of the Association continues to increase. It now numbers 270, which shows an increase of thirty-five during the year. The report by the treasurer, Mr. John Whitelaw, showed that the balances in bank and in hand amounted to 105*l.* 1*s.* 11*d.* The ordinary income during the year was 135*l.*, and the expenditure amounted to 101*l.* 6*s.* The reports by the conveners of the Sketch-book Committee and the Work-class Committee were also regarded as satisfactory. In moving the adoption of these reports, the chairman very warmly congratulated the members on the growing prosperity and the growing usefulness of the Association. A considerable number of new members were proposed for election. Mr. G. Washington Browne was appointed president for the current year; Mr. David McGibbon was elected vice-president; Mr. Hippolyte J. Blanc and Professor G. Baldwin Brown were elected vice-presidents; Mr. T. Fairbairn was re-elected honorary secretary; and Mr. John Whitelaw was re-elected honorary treasurer. The retiring President, in course of his address, anticipated that the coming session of the Association would prove a most interesting and useful one, and he was most happy to find that the Association was increasing in membership, and had made gratifying progress during recent years.

#### MR. RUSKIN'S LECTURES.

IN the third of his series of lectures on "The Pleasures of England," which was delivered on Saturday afternoon, Mr. Ruskin discoursed on "Alfred to Cœur de Lion—the Pleasures of Deed." He said it had been his endeavour in the preceding lecture to vindicate the thoughts and arts of our Saxon ancestors from whatever scorn might lie couched under the terms applied to them by Dean Stanley—fantastic and childish. That day his task must be carried forward, first, in asserting the grace in fantasy, and the force in infancy, of the English mind before the Conquest against the allegations contained in the final passage of Dean Stanley's description of the first founded Westminster; a passage which accepted and asserted more distinctly than any other equally brief statement he had met with to his mind, the extremely disputable theory that the Norman invasion was in every respect a sanitary, moral, and intellectual blessing to England, and that the arrow which slew her Harold was indeed the arrow of the Lord's deliverance. Having quoted the passage, he said there must surely be some among his hearers who were startled if not offended at being told that the minds of our Saxon fathers were, although fantastic, dull, and, although childish, stagnant; that further, in their stagnation they were savage, in their dullness criminal, and that the future character and fortune of the race depended on the critical advent of the didactic and disciplinarian Norman baron, at once to polish us, stimulate, and chastise. At the very moment when the faith, innocence, and ingenuity of the Saxons were on the very point of springing up into their fruitage, came the Northern invasion. The Northman could not in the nature of him become a Christian at all; and he never did—he only became, at his best, the enemy of the Saracen. What he was, and what alone he was capable of being, he would that day try to explain, with the consequent influence, on each side of the Channel, of this mountain and ice-bred race on the great southern one—influence, however, which virtually ended for both Frank and Saxon with the death of Cœur de Lion, as for the Italians with that of Robert Guiscard. He would advise them that in all points of history relating to the period between A.D. 800 and A.D. 1200 they would find M. Viollet le Duc incidentally, throughout his "Dictionary of Architecture," the best-informed, most intelligent, and most thoughtful of guides. His knowledge of architecture carried down into the most minutely practical details—which were often the most significant—and embracing over the entire surface of France the buildings even of the most secluded villages; his artistic enthusiasm balanced by the acutest sagacity, and his patriotism by the frankest candour, rendered his analysis of history during that active and constructive period the most valuable known to him, and certainly in its field exhaustive. He then read M. Viollet le Duc's description of the Normans on their first entering France, mentioning that as soon as they were established on the soil they became hardy and active builders. Within the space of a century and a half they had covered the country on which they had definitely landed with religious, monastic, and civil edifices, of an extent and richness then little common. They set themselves to build impregnable military walls, and sublime religious ones, in the best possible practical ways; but they no more made books of their church fronts than of their bastion flanks, and cared, in the religion they accepted, neither for its sentiments nor its promises, but only for its immediate results on national order. As he read them, they were men wholly of this world, bent on doing the most in it, and making the best of it they could—men to their death of deed, never pausing, changing, repenting, or anticipating more than the completed square of their keep and roof of their nave. Soldiers before and after everything, they learned the lockings

and bracings of their stones primarily in defence against the battering-ram and the projectile, and esteemed the pure circular arch for its distributed and equal strength more than for its beauty. They would find in all his previous notices of the French continual insistence upon their natural franchise; and they would find also, if they took the least pains in analysis of their literature down to this day, that the idea of falsehood was to them, indeed, more hateful than to any other European nation. To take a quite cardinal instance. If they compared Lucian's and Shakespeare's Timon with Molière's Alceste, they would find the Greek and English misanthropes dwelt only on men's ingratitude to themselves, but Alceste on their falsehood to each other. He had said that the Normans valued religion chiefly for its influence of order in the present world, being in this as nearly as might be the exact reverse of modern believers, or persons who endeavoured to be such—of whom it might be generally alleged, too truly, that they valued religion with respect to their future bliss rather than their present duty, and were therefore continually, in spite of themselves, doubtful of its direct commands, with easy excuse to themselves for disobedience to them. Whereas the Norman, finding in his own heart an irresistible impulse to action, and perceiving himself to be set with entirely strong body, brain, and will in the midst of a weak and disorderly confusion of all things, took from the Bible instantly into his conscience every exhortation to do and to govern, and became, with all his might and understanding, a blunt and rough servant—knecht, or knight, of God—liable to much misapprehension, of course, as to the services immediately required of him, but supposing, since the whole make of him, outside and in, was a soldier, that God meant him for a soldier, and that he was to establish by main force the Christian faith and works all over the world so far as he comprehended them; not with the Mahomedan indignation against spiritual error, but with a sound and honest soul's dislike of material error, and resolution to extinguish that, even if perchance found in the spiritual persons to whom, in their office, he yet rendered total reverence.

Having alluded to Sismondi's account of the founding of the Norman kingdom of Sicily, which was virtually contemporary with the conquest of England, he asked his hearers to read with it the sketch in Turner's History of the Anglo-Saxons, of Alfred's war with the sea-king Hasting, pointing out to them, for a foci of character in each contest, their culminating incidents of naval battle. Guiscard, in his struggle with the Greeks, encountered the Venetian fleet, under the Doge Orseolo. The Venetians were at that time undoubted masters in all naval warfare, but on the third day the tired and amazed Italians were defeated. The sea-fight between Alfred's ships and those of Hasting ought to be still more memorable to us, as the Normans were thoroughly worsted. But before he could illustrate further either their deeds or their religion he must for an instant meet the objection which he supposed the extreme probity of the nineteenth century would feel acutely against these men—that they all lived by thieving. Without venturing to allude to the *raison d'être* of the present French and English Stock Exchanges, he would merely ask any of them, whether of Saxon or Norman blood, to define for himself what he meant by the "possession of India." He had no doubt that they all wished to keep India in order, and in like manner the Duke William wished to keep England in order. If they would read the lecture on the life of Sir Herbert Edwardes, which he hoped to give in London after finishing this course, they would see how a Christian British officer could, and did verily and with his whole heart, keep in order such part of India as might be entrusted to him, and in so doing secured our Empire. But the silent feeling and practice of the nation about India was based on quite other motives than Sir Herbert's. Every mutiny, every danger, every terror, and every crime occurring under or paralysing our Indian legislation, arose directly out of our national desire to live on the loot of India, and the notion of English young gentlemen and ladies of good position falling in love with each other without immediate prospect of establishment in Belgrave Square, that they could find in India, instantly on landing, a bungalow ready furnished with the loveliest fans, china, and shawls, ices and sherbet at command, four-and-twenty slaves succeeding each other hourly to swing the punkah, and a regiment with a beautiful band to "keep order" outside all round the house.

Describing the men who lived at the date of his lecture, Mr. Ruskin said they were men who took pleasure in deed. They did not suppose—they, British boys—they overthrew Napoleon when their Prime Minister folded up the map of Europe at the thought of him. Not they; but the snows of heaven, and the acts of Him who dasheth in pieces with a rod of iron, who casteth forth His ice-like morsels, who could stand before His awe. Mr. Ruskin exhibited a handsomely illuminated leaf from the Bible of Charles the Bald, grandson to Charlemagne, which bore in the centre a yellow lion. It bore out the religion expressed in the prayer of Alfred, which he had read at the last lecture. The motto on the Bible leaf was:—"This lion rises, and by his rising breaks the gates of hell; this lion never sleeps, nor shall sleep for evermore." That was the inscription round the first authentic lion which they got. The Professor remarked that he must here leave the lecture for that day, because, as they chose to spend their University money

in building ball-rooms instead of lecture-rooms, he could not remain any longer in that black hole with nineteenth-century ventilation. Before concluding, however, he exhibited several specimens of art, tracing the development of the lion from that in Alfred's time to the present day. Holding up a framed cartoon from *Punch* of two illustrations in that journal on August 19 last, he said they had there the modern British lion, drawn by themselves, and also the peculiar product of the nineteenth century, idealised and realised in the same copy of *Punch*. The one cartoon represented "Jones and Smith at two different stages of the same sumptuous dinner," and the other was Mr. John Bright as a lion, with a lordly coronet beneath his paw. *Punch's* explanation of the picture was "The Old Lion Roused." Mr. Ruskin had changed the word old to "new," and that of roused to "stuffed." The subject for next Saturday is "Cœur de Lion to Elizabeth—the Pleasures of Fancy."

## EARLY CELTIC MONUMENTAL INSCRIPTIONS.

THE sixth and concluding lecture of the Rhind lectures in archæology has been delivered by Sir Samuel Ferguson, Q.C. The lecturer described all the Oghamic monuments of Scotland as belonging to the scholastic variety, in which digits constituted vowels as well as consonants, and the notch was unknown. The Scottish Oghams might therefore be considered the more modern, and in them they might be prepared to find more of that studied obscurity which appeared to have originated in the pedantry of later ecclesiastical scribes. The monuments were about equally distributed over the mainland and the islands, all the examples of the former being allied with peculiar Picto-Scottish forms of sculpture. Beginning with the Shetland Islands, the most distant point northward at which Ogham inscriptions had yet been found, Sir Samuel described the Lunnestaing monument, which was clearly, almost elegantly, cut on a smooth flag, retaining the traces of every character, yet the artist had succeeded in making it one of the obscurest Oghams with which he was acquainted. One of other two Oghams in Shetland was the Bressey monument, which afforded further evidence of the Ogham having been in use among a mixed Celtic and Norse population, and was a most welcome and well-assured standing ground in chronology. He knew not whether to regard the Bishop of Limerick's identification of the St. Olan monument in Ireland or of that record of the descendants of Naddodd, the discoverer of Ireland, as the more brilliant critical achievement. The stone was of considerable size, covered on both faces with Christian ecclesiastical sculpturings, set in a symbolical framework representing the swallowing and disgorgement of Jonah, and engraved on both edges with Ogham legends, which seemed to belong to about the middle of the tenth century. Having referred to the Orkney example, from North Ronaldshay, and now in the museum of the Royal Society of Antiquaries, which he considered the most minute lapidary Ogham hitherto found, the lecturer said it might exercise a good deal of speculation to know how that writing came into Orkney and the Shetlands. The more obvious idea would be that it had been introduced by the Columban clergy. But the question might be asked, with much cogency, how it happened that there were no traces of Ogham at Iona, or Derry, or Durrow, or Kells, or at any of the centres of Columban missionary activity on the Continent? The pre-Columban Christianity of Scotland was that of Galloway and Strathclyde, but these districts were destitute of Oghams. Pictland alone on the mainland of Scotland possessed them, in like manner as it alone possessed its particular lapidary symbolic sculptures. Pictland, certainly, would be the highway to the Northern Islands and to Iceland, and it might be worth consideration whether the Christian monks called Papæ, whom the discoverers of Iceland found there in the ninth century, were not the representatives of some such pre-Columban influence from the Scottish mainland; for Papa, although it had lingered in the Breton Church, was certainly not Columban nor Irish, but characteristically Eastern. Coming to the mainland of Scotland, Sir Samuel said the monument which in its general aspect most resembled the old Irish and Welsh examples, was that at Newton, in the Garioch, Aberdeenshire. The remaining four in Scotland were at Logie and Aboyne, Aberdeenshire; Scoonie, in Fife; and Golspie, in Sutherlandshire. The Fifeshire monument offered an animated representation of a stag hunt, and, if they accepted as an analogy the sculptured slab of the stone coffin of St. Andrew, these hunting scenes pointed to the pursuit of salvation in Christ. The mystical chase, however, was but one of a great number of lapidary devices of an extraordinary kind which occurred as well on Ogham as on other stone monuments throughout the old Pictish part of Scotland. Dr. Joseph Anderson, Edinburgh, had the distinction of having demonstrated the Christian character of several of these monuments, independently of the crosses engraved on them. A cross, indeed, did not absolutely and of necessary inference show a monument to be Christian; but the general presumption in favour of the Christian symbol being of Christian times was so strong, that one could not

but think those antiquaries over-fastidious who declined to accept its evidence on the monuments of an ancient Christian country, because it was accompanied by unexplained forms of animals and other devices of crescent moons, circles, and sceptres, with which Dr. Stuart in his magnificent work had made the learned world familiar. These objects accompanied the cross on several monuments of this class, which Dr. Anderson had demonstrated to be Christian by comparing one of their sculptured features with the Jonah and whale of the Catacombs, and of Mediæval metal-work. He had also identified other objects on the same monuments with what might be called scenes in natural history, drawn from a peculiar kind of literature which still, the lecturer believed, rested in MS. in the Bestiaries of the latter Middle Ages. A further proof of the entirely Christian nature of all those objects was to be found in the Norrie's Law symbol, which existed in several varieties of form throughout the Picto-Scottish field. The general outline presented the neck and head of an animal, equine or canine, as in the examples from Wemyss Cave and Norrie's Law. That outline was, so to speak, transfigured into a branch-like contour by a conventional floriation of the lines of the head. In one of the Scottish figures, that of the elephant, the terminal convolutions, which in the Swedish symbolic creature were confined to the face and jaw, were extended to all the extremities. The Clavis ascribed no special meaning to the elephant; but in the Bestiaries it was treated as the emblem of chastity. Whether it was a type merely of a particular virtue, and so referable to the Mother of our Lord, or was a symbol having a more universal meaning, this device of the transfigured elephant had a proved antiquity, carrying back its use in Scotland, where alone it had been found, into the age of urn-burial and of the use of bronze weapons. That it was always of Christian import he inferred from its always being found in Christian emblematic company; and if it were so, it carried back Christianity in Scotland to a surprisingly early date, and tended powerfully to set up the old traditions of a pre-Ninianite conversion. Looking back on the entire series of his lectures, Sir Samuel said there appeared to be two questions of primary importance for the historian and philologist:—Was this method of writing of Pagan or of Christian origin? and was the language in which these names and formulas were expressed a quasi-hieratic dialect, not trammelled by the ordinary laws of Celtic speech, or was it the vernacular language of those who carved the inscriptions? No treatment of the first question was likely to be satisfactory which did not fully investigate a class of quasi-Oghams and pseudo-Oghams in both countries, of which he had not time to speak, as well as all the remains of inscriptional figuring on the Pagan sepulchral monuments of the Boyne and Slieve-na-Calliagh districts. As regarded the second, he was content to leave it in the hands of those who had made the philosophy of language their study, claiming only the credit of having supplied their researches with authentic data in the texts he had presented. His hope was that, from the material he had assisted in supplying, future investigators might derive larger and surer conclusions, which might give to Ogham literature a well-ascertained place among the aids to the early history of our islands.

#### LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE annual meeting of the Leeds Architectural Society was held on Monday at the Institution, Leeds. The President (Mr. E. Birchall), after a few preliminary remarks, in which he congratulated the Society upon its progress, handed the rewards to the two prize-winners. Mr. J. H. Greaves, Pontefract, received a silver medal, awarded by the Society, together with five guineas from the President, for a set of drawings and details illustrating Woodsome Hall, near Huddersfield, whilst Mr. C. E. Tute received the sum of two guineas, given by Mr. J. B. Fraser, F.R.I.B.A., for a design for a church tower and spire. The President then delivered his address. It might, he said, be of advantage to the Society and to the profession at large if the Society were affiliated with the Yorkshire College, where there might be instituted a Chair of Architecture both constructive and artistic. Such an alliance would be of assistance in guiding administrative work, and might lead to the formation of a collection of plans, sections, and elevations of remarkable buildings drawn to a uniform scale, to the supervision of the building by-laws of the borough, to modifications in legislation affecting the erection of buildings, and to the testing of patents and new materials. The preservation of civic buildings and public monuments might well come within the purposes of architectural associations generally. He would suggest the appointment of a Committee of Advisers, whose duties should be to report on the condition of theatres, baths, markets, and similar buildings, to superintend the erection of buildings fronting public streets, and to examine buildings in course of demolition, unhealthy and dangerous establishments, and premises injured by fire. The President went on to express the opinion that the architect was not sufficiently appreciated by the employing world. Hasty criticism and condemnation of designs, that had taken weeks of professional

study by men of special learning, was too frequently bestowed upon such work by awarding committees of competitions; and the result was that architects were beginning to show an indifference towards entering such competitions. Frequently the committees found out their mistake when it was too late. To remedy this anomaly the President suggested the appointment of professional assessors, whose awards should, as a rule, be final. One encouraging sign of a more appreciative taste for architecture, and of a desire for real professional art and science, was that architects were becoming more generally consulted on designs for decorating and furnishing the interiors of houses and other buildings. The articles that had recently appeared in certain journals on the subject of house drainage had increased public alarm rather than helped to remedy the evil. The defects of drainage generally he traced to the workmanship of speculative builders, who stood aloof from professional assistance; but sometimes it was traceable also to the laxity of former sanitary authorities. He urged that house buyers and occupiers should have the properties more frequently examined by competent surveyors so as to insure the premises being kept in a satisfactory sanitary condition. Local authorities, he suggested, should be armed with additional summary powers to compel landlords to repair and maintain their houses in a habitable and cleanly condition, and to prevent the demoralising influence of over-crowding; in default of which the buildings should, after due notice, be demolished. Sufficient power should be given to the inspectors to enable them to go about their work fearlessly. Alluding to the subject of the dwellings of the poor, the President pointed out the prospects of several companies formed for erecting artisans and labourers' dwellings. Some of them were paying on an average a dividend of 5 per cent. The arrangement of town houses on flats for the "better" classes had had a short trial, but he did not think this system was growing in popularity. An outbreak of infectious disease would, he thought, be very disastrous in such buildings. As to the smoke abatement question, he did not think the smoke nuisance was to be overcome simply by appliances or alterations of chimneys. A good deal of help could be rendered by the exercise of greater economy at the domestic firesides, and by a more thorough sweeping of the streets. It would be of advantage if Mr. Pridgin Teale's system of economising fuel could be adapted to furnaces.

A vote of thanks to Mr. Birchall, for the address, was proposed by Mr. W. H. Thorp, A.R.I.B.A., and seconded by Mr. Harry May, A.R.I.B.A. Having been supported by Mr. G. B. Bulmer (hon. secretary) and by Mr. Simpson (of Wakefield), it was cordially agreed to.

The Secretary next read a code of new rules, to facilitate the election of members at any time during the year, instead of, as now, only during a session. These having been adopted, the question of the affiliation of the Society with the Yorkshire College was referred to a committee for consideration.

#### THE INTERNATIONAL HEALTH EXHIBITION.

THE following report from the executive council of the International Health Exhibition was presented to the Prince of Wales on the last day of the exhibition:—

May it please your Royal Highness,—We have the honour to report that the International Health Exhibition was closed this evening, the attendance on this the closing day having been 37,168. The exhibition has been opened 151 days, being five days less than the Fisheries Exhibition in 1883. The fact that 4,167,683 admissions have been registered during the hours this exhibition has been open incontestably proves the public approval of its objects, and also demonstrates the great value for exhibition purposes of the ground at the disposal of the Commissioners of 1851. Even this site, however, extensive as it is, was found in practice very restricted for the full accommodation of the recent exhibition and the comfort of the numerous visitors. The close attention given to the various exhibits, together with universal good order, has been a characteristic feature of the exhibition throughout. Notwithstanding the large numbers, as high as 71,884 in one day, which have thronged the gardens and buildings, no injury has been done, no loss sustained. The exhibition has comprised the exhibits of 2,109 exhibitors, supplemented by the Chinese exhibitions and the collections forwarded by the Japanese and Siamese Governments, and also by some exhibits which we deemed it proper to form, or to assist in forming, as being beyond the scope of ordinary exhibitors. Such were—1, the historical series of dress exhibits; 2, the display of the power of electric light for external and internal lighting, as also for ornamental display; 3, the Tartar mares from Orenburg and the preparation of koumiss on the spot; 4, the sanitary and insanitary houses; also, as having a special scientific educational value, 5, the hygienic laboratories, biological and physical; and, 6, the formation of a library of sanitary works and papers. Of these it is hoped by many persons that the library and the laboratories may have more than an ephemeral existence. The library, containing already a valuable collection of publications and Government papers on sanitary matters from all parts of the world, would—if made accessible free of charge throughout the year to the many who

take an interest in sanitary questions, and supplied with the various publications and papers from time to time issued on such matters—doubtless be of very great utility. It would enable those interested readily to ascertain recorded facts, and thus remove misapprehension on matters of vital import to the well-being of the nation. The maintenance of the laboratories would insure a means of sanitary research and teaching for the future which England has not had in the past. In these laboratories studies could be carried on, and teaching could be given of a kind similar to that which is afforded by various foreign institutions which have been established in the interest of the public health. These studies have a direct bearing on the solution of health problems, which not only affect the well-being of communities, but exercise an important influence on agricultural and commercial interests. With your Royal Highness's permission, we would propose to consider further these matters, and perhaps make suggestions for your Royal Highness's consideration. The educational division of the exhibition, mainly displayed in the City Guilds Institute, contained a very good representation of the most important educational movements, and deserved the close study given to it by those specially interested in education. It would be impossible to enter into details about the various elements of this exhibition; but the gymnastic exercises for boys and girls conducted under the guidance of the educational division of the exhibition met with approval from the public and from educational authorities. In order to make this undertaking as useful as possible for advancing knowledge, arrangements were made for holding a series of conferences and for the delivery of lectures on subjects connected with public health and education. These conferences were conducted under the superintendence of various societies. They dealt with many subjects of public interest, and it is believed that much useful information was thereby diffused, and that in some instances practical results of value to the public health may be expected. We have the honour to transmit a complete set of the literature of the health branch of the exhibition, comprising, in volume form, twenty-eight handbooks and the reports of fourteen conferences and thirty-eight lectures. Those connected with the educational branch will accompany our further report. The expenses of the exhibition, both in its organisation and maintenance, have been heavy. The magnitude of the work which was done will be fully demonstrated in our final report, which we shall shortly make; but we are already enabled to state that no call will have to be made upon the guarantors, and that we shall be in a position to return the several deeds of guarantee. For and on behalf of the Executive Council, BUCKINGHAM and CHANDOS, Chairman.

#### PETERBOROUGH CATHEDRAL.

A LETTER has been written by Dr. Walker, of Peterborough urging the claims of the cathedral to be preserved, restored and beautified at the public expense. Describing the work of the past two years he says:—The great central Decorated tower, with the defective and crumbling Norman piers on which it was supported, has been carefully taken down, and the work of restoration has progressed as far as the rebuilding of these piers up to their capitals. During the preliminary work of demolition several points of great antiquarian interest have come to light, not the least important being the discovery, among the materials of which the tower was constructed, of a sufficient number of the wrought stones of its predecessor to enable the architect, Mr. Pearson, to restore, on paper, many of the details of that magnificent, lofty, three-storeyed, but probably badly built Norman tower. No one familiar with our cathedral can forget the want of height in the central tower, which has just been removed. To cancel its stunted appearance, the original or contemporary architects raised an octagon wooden structure; and when this was removed in 1798, Dean Kipling, with the same object, built at his own expense the four corner turrets which have received much invidious notice since his time. The question has now arisen whether in rebuilding the tower the defect which was inevitable in the fourteenth century, since the weak piers could carry no loftier structure, should be repeated, or whether, now that pillars of perfect solidity resting on stable foundations have replaced the feeble ones, it is not the duty of the custodians of the edifice—of those who are building for future centuries—to reconstruct the tower, so that while it shall retain the beauty of the fourteenth century design it shall lose the very palpable defect of its dwarfed proportion to the building of which it forms a part, a defect which is believed by some to have been intentional in order that the eye of the observer might not be attracted from the western front. Mr. Pearson has prepared a design in which, by inserting one stage of the old Norman arcading, he raises the base on which the decorated tower is to be replaced 30 feet. This in itself would give to the tower that dignity which was aimed at by the device of the wooden octagon, and later by Dean Kipling's four turrets; but what is of almost greater importance is that it would give the opportunity at any future time for those who had the means at command to erect a central spire which would be proportionate to its base and to the glorious building of which it

would be the centre. In the fourteenth century the height of the tower was of necessity regulated by the weight which the piers could carry. The tower then erected was, almost certainly, only a compromise between that which the genius of the architect conceived and that which the feeble foundation demanded. If now the Dean and Chapter are driven, either by the cruel pressure of impecuniosity or by the dread of diverging from the compromise of the fourteenth century, to retain inch for inch the former dimensions, and again to bury the tower among the high-pitched roofs of the nave and transepts, they not only perpetuate a defect, but they, the custodians for the moment of this national building, place an impregnable barrier in the way of any future efforts to give dignity to this main feature of the edifice. At a recent meeting of the restoration committee, who represent the subscribers of the funds, a resolution was passed recommending Mr. Pearson's plan to the Chapter, and I trust that this recommendation of the committee may be backed by further expressions of public opinion, and that to these expressions may be added such further pecuniary aid as may provide the 5,800*l.* required to carry out the design.

#### GREEK TREASURE TROVE.

THE case of the three Greeks, Jean Frango, and Antonio Frango, farmers, and Nicolas Nicolaine, a pilot, who were charged with being in unlawful possession of two pieces of statuary worth 15,000*l.*, and belonging to the Greek Government, was again heard at the Thames Police Court on Friday in last week. According to the Greek laws, the prisoners were under very heavy penalties for removing the statuary from Greece without the permission of the Government. Chief-Inspector Greenham said that he kept observation on the prisoners after their arrival from Smyrna on board the *Ardmelle*. On October 1 he saw the three prisoners, and had some conversation about the statuary. Witness was first shown the head, and Nicolaine said that he would take 110*l.* for it. Next the statue was produced, and Nicolaine said that he wanted 10,000*l.* for that, which would be the lowest, as they had had that amount offered for it in Paris. Witness said that he would give 1,500*l.* for the statue of the female, but Nicolaine said that would not do at all. A fireman on board the steamship *Ardmelle*, said that on the voyage from Smyrna he had some conversation with the two Frangos about the statuary. They said that they wanted to take it back to Greece, but that Nicolaine would not let them. Afterwards one of them said that they would give him 100*l.* not to say anything about the things.—Mr. C. T. Newton, C.B., Keeper of the department of Greek and Roman antiquities, British Museum, said that he had examined the two pieces of statuary. As far as the head was concerned that was undoubtedly antique. It was probably of the time of Augustus. With regard to the female figure witness also believed that that was antique, but he could not speak so positively as to that. He should like to compare it with other antiques, and have it washed. The statue probably represented the Greek Diana. Witness would prefer not to name any value for either the head or the other figure.—By Mr. Abrahams: I have never heard of the Elgin marbles being claimed by the Greek Government. I believe that Lord Elgin obtained a firman from the Sultan for their removal. I have purchased Greek antiquities at Paris and elsewhere, but I certainly have never been charged in connection with such purchases.—Mr. F. Whelan, dealer in antiquities, said that he had examined the statuary. He believed that they were genuine. With regard to the head, in witness's opinion it would be worth about 5*l.* With regard to the female figure, the market value of that would be 200*l.* or perhaps 300*l.* In witness's opinion 10,000*l.* would be an absurd sum to ask for it.—The Secretary to the Greek Consulate said there was a special law passed relative to the discovery of antiques. By it the finder was bound to give notice within three days, under penalties, to the Government of his discovery. The property then became his and the Government's, a kind of co-partnership in fact. He could get permission of the Government to sell it to any one in Greece, but he had to hand over half the purchase-money to the National Museum. If he attempted to remove it from the country without permission he was liable to be fined from 50 frs. to 500 frs. If he did take it or sell it out of the country, he would be liable to be dealt with under the ordinary penal code for theft of partnership property. After a long discussion between the legal gentlemen on both sides, Mr. Wontner said that he would ask that the men might be discharged and the statuary remain in the hands of the police. Mr. Abrahams said that he should object to that. If the men were to be discharged the things should be restored to them; the police had no right to detain them. Mr. Saunders said that he thought that this was reasonable enough; if he discharged the men he thought that he should make an order for the police to give up the things. Mr. Wontner said that he should contend that his worship had no power to make such an order. In the end Mr. Saunders discharged all three prisoners, and appointed a day, in about a fortnight's time, when the question of ownership should be argued, the statuary meanwhile to remain strictly in the hands of the police.

## NOTES AND COMMENTS.

MR. COLE ADAMS, in his presidential address, had to call attention to the absence of competition for the essay prize. The Académie Royale de Belgique is, as regards literary composition, in the same difficulty as the Architectural Association. A prize was offered in the class of architecture for an essay upon Flemish architecture in the sixteenth and seventeenth centuries, but only one student made an effort to gain it. His essay was not, however, considered to be deserving of the reward.

M. GARNIER, the architect of the Paris Opera House, has obtained the appointment of a committee representing the Société des Amis des Monuments Parisiens, for the purpose of conferring with the authorities of the city on the best means of preventing the ruin of the sculpture of the Porte Saint-Denis. The gate was erected as a memorial of the victories of LOUIS XIV., in Flanders, from the designs of FRANÇOIS BLONDEL, who was Maréchal de Camp as well as an architect. The reliefs were designed and partly executed by F. GIRARDON, Inspector-General of Works of Sculpture, and were completed in 1674 by MICHEL ANGUËR. One of the objects of the society is the preparation of a catalogue of the principal architectural works in Paris. It is now proposed to extend the field of operations by including remains of old work which may still exist in nooks and corners, and, by forming a Committee of Taste, to aid in securing the amenity of the City.

M. GUSTAVE CHAUVET announces the discovery in a tumulus known as the "Gros Guegnon," on the right bank of the Charente, of a bronze chariot, curiously ornamented, and similar to those which have been found in Scandinavia and Mecklenburg. The body lay in a vaulted recess, and on either side were wheels with detached circular and spherical ornaments, bronze and iron nails, with two Gallic urns. The discovery of another chariot-bier is reported from Septaulx (Marne). The skeleton of a boar, with a knife embedded between the ribs, was found in front of the right wheel. The weapons, horse-bits, and rings enclosed in the tumuli appear to indicate their Gallic origin.

THE last number of the *English Illustrated Magazine* has an interest for architects on account of the illustrations to the article on Eton, which are by Mr. HERBERT RAILTON, A.R.I.B.A. A year or two since Mr. RAILTON was an assistant in an office in Blackburn; he is now recognised as one of the best draughtsmen for newspapers and periodicals. His Eton sketches show a love of the picturesque and a mastery of light and shade, together with skill in expressing the style and character of old work. In their way they are almost unique. They are the drawings of an artist who has had the great advantage of architectural training. With so much skill there is no reason why Mr. RAILTON should not gain eminence in painting, and etching on copper.

THE programme of the Leeds and Yorkshire Architectural Society includes the following papers:—"The Royal Institute of British Architects," by Mr. J. W. CONNOR, F.R.I.B.A.; "A Conversational Address on Fireplaces," by Mr. T. P. TEALE, M.A., F.R.C.S.; "English Homes in the Seventeenth Century," by Mr. J. A. GORCH; "Lightning Conductors," by Mr. SAMUEL VYLE, M.I.C.E.; "An American Frame House," by Mr. G. BEAUMONT, A.R.I.B.A., Chicago, U.S.A.; "Architectural Competitions," by Mr. C. A. ADAMS, F.R.I.B.A.; "The Architecture of the Last Half-Century," by Mr. WALTER SMITH (Technical School, Bradford). Mr. T. G. JACKSON will also read a paper. The Society has a class of design in working order, and offers several prizes to students.

IN his address at the opening of the Class of Engineering in Edinburgh University, Professor FLEEMING JENKIN referred to the present position of electric lighting. It was popularly considered a failure; but according to the professor that arose because, in the first place, an absurd rush had been made on every electric invention brought forward, whether meritorious or not, and large quantities of money had been lost on them, so that now the whole commercial world simply hated the word "electricity;" and, in the second place, because of mistaken

legislation, which must before long be modified. But the present standstill with regard to that use of electricity was, he felt convinced, really only temporary.

THE disaster at the Star Music Hall, in Watson Street, Glasgow, on last Saturday evening, by which fourteen people were killed, is a startling comment on the returns which were lately made to the Dean of Guild showing the relation between accommodation and means of exit in the public buildings of the city. There were about 1,300 people in the pit and gallery on Saturday—or 500 less than the house can hold—while the exit capacity is only equal to 980 people. There was a gate in the passage, and by a fatality, which is not uncommon, it is supposed to have been closed, and thus to have formed a barrier against the egress of the excited crowd. The staircase from the gallery is somewhat spiral, and in parts is only about 3 feet 6 inches in width. Under the circumstances it might be said to be providential that the destruction of life was not greater.

THE Record Society has held its annual meeting in the Chetham Hospital, Manchester. During the year two volumes have been issued to members. One is entitled "The Rolls of Burgesses at the Guilds Merchant of the Borough of Preston, 1397 to 1682, from the Original Rolls in the Archives of the Preston Corporation," and has been edited by Mr. W. A. ABRAM. The rolls for the eighteenth century will form another volume, to be published hereafter. The second volume issued during the year is "A List of the Lancashire Wills proved within the Archdeaconry of Richmond, and now preserved in Somerset House, London, from A.D. 1457 to 1680." It has been edited by Lieutenant-Colonel FISHWICK, F.S.A. Mr. JAMES HALL has undertaken to edit for the Society an original document of great local interest relating to the Civil War in Cheshire, written by Mr. THOS. MALBON, of Nantwich, who was living in or near that town, and died in 1658. The original MS. is preserved at Condover Hall, county Salop. It has also been suggested to the Council that a volume containing a full account of the various MSS. relating to Lancashire and Cheshire contained in the various public libraries in the two counties, with an analysis of the contents of each volume, would be a very suitable publication for the Society to undertake. This would include and be an index to the 45 folio volumes of the Raines MSS. (now in the Chetham Library), the Picope, Palmer, Barritt, and other local MSS. there, as well as those in the free libraries of Manchester, Liverpool, Salford, Warrington, Preston, Wigan, &c., many of which are full of very valuable local information, but owing to the want of indexes are but little known, and not nearly so frequently consulted as they might be.

A REMARKABLE circumstance in connection with the history of railways has lately come to light. In September 1809 the first experimental railway in the United States was laid out by JOHN THOMSON, civil engineer, of Delaware County, Pennsylvania, and constructed under his direction by SOMERVILLE, a Scotch millwright, for JAMES LEIPER, of Philadelphia. It was 60 yards in length, and graded an inch and a half to the yard. The gauge was 4 feet, the sleepers 8 feet apart. The experiment with a loaded car was so successful that LEIPER had the first practical railroad built in the United States constructed for the transportation of stone from his quarries on Crum Creek to his landing on Ridley Creek, Delaware County, a distance of one mile. It is of interest in this connection to know that, previous to the introduction of canals or railways into the United States, ROBERT FULTON, a native of Pennsylvania, went to England, where he spent some years, and in 1795 he contributed some essays on the subject of canals to the London *Morning Star*, and in the spring of 1796 published in London his treatises on the improvements of canal navigation, profusely illustrated with drawings showing his designs for boats, bridges, aqueducts, elevators, &c. With this treatise he published a letter to the Governor of Pennsylvania, pointing out the advantages of canals over turnpike roads, in which he predicted that "the time will come when canals shall pass through every vale, wind round every hill, and bind the whole country in one bond of social intercourse." He sent a copy of his work to President GEORGE WASHINGTON, who returned him a flattering acknowledgment; and he continued to urge this subject on public attention.

CAST-IRON ARCHED RIBS FOR MIDDLESBROUGH TOWN HALL AND MUNICIPAL BUILDINGS.

WE have already illustrated the design for the new public buildings in Middlesbrough, and this week we publish a copy of a photograph showing the remarkable cast-iron arches which have been adopted in preference to wrought-iron girders to carry the floor of the great hall.

The size of the hall is 118 feet 6 inches long by 60 feet wide. The whole of the space underneath is intended to be used as a police drill hall. The floor of the lower hall is about  $4\frac{1}{4}$  feet below the general pavement level, and the floor of the Town Hall is  $10\frac{1}{2}$  feet above, thus leaving a height of 14 feet 6 inches from the basement-floor line to that of Town Hall.

It was a *sine quâ non* that the floor space of drill hall should not be impeded by columns, and as the width of the floor which had to be carried was 60 feet, a difficult problem presented itself as to how to accomplish the result desired without unduly lessening the height of the drill hall by using girders of great depth. It may be remarked that it was not permissible to increase the height of the storey either by lowering the basement or raising the level of the floor of Town Hall. If ordinary wrought-iron girders had been used for so wide a span as 60 feet, it would be necessary, in order to insure the rigidity that was demanded for so important a public room, to have their lower flanges not less than  $4\frac{1}{2}$  feet below the Town Hall floor level. The net headway in the drill hall would therefore be only  $9\frac{1}{2}$  feet. The effect of a succession of main girders of such a depth across a room 120 feet long would have been utterly ruinous to its appearance, so far as architectural effect was concerned, and in consequence it had almost been decided to give up the idea of dispensing with columns, with a view of lessening the depth of the girders, when an alternative scheme was suggested of constructing each main girder as a cast-iron arched rib. This scheme was carefully worked out in detail, and it was found to be decidedly more economical than the first proposal of large wrought-iron girders, and, in fact, not more costly than the objectionable alternative of using smaller wrought-iron girders supported by columns.

There were other advantages in favour of the arched plan. The total headway in the centre of the drill hall is 12 feet 3 inches, or 3 feet more than was possible with wrought-iron girders, while even at the abutments there is ample height to allow of the marching of men with fixed bayonets close to the wall. The whole of the floor space can therefore be used without any obstruction or inconvenience. The architectural appearance of the drill hall is no less improved than its utility. The perspective of light cast-iron traceried ribs will have a most pleasing effect.

The general section of the ribs is 18 inches deep by 12 inches wide, the upper and lower flanges being less in width than the middle one, and the thickness of metal varies from 1 inch to  $1\frac{1}{2}$  inches. The upper part of the rib, however, at crown, is concealed in floor, so that the apparent depth of the rib below the ceiling line at that point is less than a foot. The spandrels of the arches are filled in with an effective arrangement of tracery in circles, enriched by quatrefoils. The larger circle will be further embellished with shields, displaying the arms of the Corporation.

The estimated distributed load on each of the arch ribs is about 40 tons, while the lateral thrust at each external abutment under the load will be about 50 tons. As the point of abutment is several feet above the level of the external ground it was necessary to make some special provision for buttressing the arch, and an ingenious arrangement for doing this was designed, which insures absolute security without in any way disturbing or modifying the architectural treatment originally proposed for the external and internal piers. The photograph shows the form of casting designed for this purpose, and it is sufficient to say that before the abutment can be moved the whole weight of the wall of the Town Hall must be lifted.

The architect for the building is Mr. G. G. HOSKINS, F.R.I.B.A., of Darlington.

The engineering work above referred to (as well as the fireproof floor) was entrusted to Messrs. DENNETT & INGLE, of

Whitehall and Nottingham, and has been successfully carried out by them. The castings are of very superior quality, notwithstanding their great size, which is no less than 32 feet by 8 feet for the half ribs, and they have been cast without a flaw. The floor of the Town Hall, which the ribs are designed to carry, is to be of Messrs. DENNETT & INGLE's well-known method of fireproof construction. In this case it will consist of rolled iron joists resting on the upper or horizontal flanges of the arched ribs, and gypsum concrete arches running lengthwise of the room, in spans of about 7 feet.

The engineering details of the work were designed for Messrs. DENNETT & INGLE by Mr. R. M. ORDISH, C.E.

The buildings are making satisfactory progress under the large staff of workmen employed by Mr. E. ATKINSON, of Bradford, who is the general contractor for the works. Mr. JOHN HINDMARCH is the clerk of the works.

FOXWOLD, BRASTED.

THIS house is now being erected for Mr. H. N. PYM on an elevated site in the beautiful valley lying between Sevenoaks and Westerham. Very extensive views are obtained from the house, and the building has been specially planned to obtain these views from all the principal rooms. The contract for the house has been taken by Mr. R. DURTNELL, of Brasted.

All the external walls on the ground-floor are built hollow, and faced with red bricks obtained from Lord STANHOPE's brickfield at Chevening. All the stone has been obtained and worked at Mr. SUMSION's Monk's Park Quarry, Bath, and sent up ready for fixing. The timber framing of the first floor will be executed in oak, filled in with rough cast, and partly weather-tiled. The roof will be covered with dark local tiles from the Bat and Ball Brickworks, Oxford.

In addition to the mansion, an entrance lodge has been built, and a carriage drive formed up to the house.

The whole of the work is being erected from the designs and under the supervision of Mr. ALEX. R. STENNING, F.R.I.B.A., 121 Cannon Street, E.C.

Our illustrations are taken from the drawings that have been exhibited in this year's Academy.

## MR. EWAN CHRISTIAN'S ADDRESS.

THE following address was delivered by the President at the meeting of the Institute on Monday evening:—

Gentlemen,—On bidding you farewell at the closing meeting of last session I expressed a hope that in the beginning of this you would come here refreshed both in body and mind after rest from your labours. I trust that hope has been fulfilled, and though it has been said that the enforced recess is a point on which the Institute requires reform, I must say for myself that I do not in any way agree with that opinion. We all work hard, and rest is needful; and to the officers of this Institute, who to their ordinary vocations add the labour of attending to its interests, I can assure you the vacation is uncommonly welcome.

As regards students, the library is only closed for one month, and that the month above all others in which they can be most usefully learning from nature and not from books; therefore, with an easy conscience, I bid you welcome to the work of the opening session.

The year has been a notable one, both as regards this Institute and the interests of architects. Fifty years of existence have had to be remembered and pondered on. Valuable papers have been read and discussed, especially one with reference to the question of education. Alterations in the government of the Institute have been suggested; an important competition has been entered upon and decided; a conference has been held between the members of our own bodies and others outside; and, lastly, we were asked to take part in a conference of importance at the Health Exhibition, on matters in which architects ought to be specially interested.

On each of these subjects I shall have a few words to say; and I trust you will bear with me in traversing the ground.

*The History of the Institute.*

First, then, in this our jubilee year, let us contemplate for a few moments that which, whether for good or for evil, is now irrevocably past, and then consider for a while whether in all respects we have fulfilled our duty on the lines laid down by the founders of this Institute. And, looking back on the fifty years of our existence, what a wonderful half-century it has been! It has witnessed almost the commencement and the great development of the railway system; the invention and progress of the electrical telegraph, the enormous expansion of postal facilities not yet fully developed, the bridging of the ocean by swift and safe steamers of

ever-increasing power and convenience, the introduction and development of photography, the conception and execution of some of the largest and most important works of engineering the world has perhaps ever seen; the great series of international exhibitions, commencing with that of 1851, of which the late Prince Consort was a most ardent and earnest promoter; besides almost numberless achievements in all departments of science literally fulfilling the prophecy that "many shall run to and fro, and knowledge shall be increased," in a manner that could only have been dimly imagined by the commentators of old; and, not to travel beyond the bounds of our own art and country, it has witnessed a most remarkable revival of ecclesiastical architecture; the rise and full development of the power, happily not yet extinguished, of the great art-critic whose fervid eloquence has done so much not only to open the eyes of the general public to the beauties of art in all its phases, and of the glories as well as the minutiae of nature; whose writings on the subject of our own particular art have had, and I venture to think will have, a wider influence on its study and practice than those of any other man who preceded him, for no nobler writings than those of John Ruskin have graced the half-century of which I have to speak.

It has witnessed almost the whole career of one of the greatest architects of modern times—Charles Barry—and of another man of genius, architect and writer, Aug. Welby Pugin; the whole career of George Gilbert Scott, and, unhappily also as regards their termination, those of George Edmund Street and William Burges, whose loss we have so sorely mourned as all but irreparable, not to speak of those who before its commencement had made their names famous, including our first professional president, the eminently learned and graceful Charles Robert Cockerell, nor of those whose careers, commencing within its area, are still happily amongst us.

#### *The Future of the Institute.*

What the next half century may produce if the world lasts so long, God only knows; but if I may compare the privileges now possessed by the young men of our fraternity with those with which the great men I have named were familiar in their youth, presuming there is in the rising generation as yet undeveloped genius equal to that which has preceded it, much ought to be expected.

I cannot but remember that in the year this Institute was founded I entered the Royal Academy as a student. In those days there was indeed a professor of architecture who gave a biennial course of lectures to students, read by the professor of painting, which, commencing with primitive huts, described all the dry bones of the art with but little allusion to its glorious beauties.

When there was only a small architectural library open one evening in the week, and no special architectural journal had as yet been started, when I compare this state of things with the advantages now possessed by students in the fine library of the Institute, almost always open, in the regular instruction at the Royal Academy of a professed teacher of architecture, supplemented by the personal supervision of eminent members of our profession; the courses of lectures given by able professors at the University College and King's College, which all pupils may attend at small cost, besides the very valuable assistance rendered by a special architectural press, which, commencing with the *Builder* more than forty years ago, has developed so largely, affording opportunities for the acquisition and discussion of every branch of knowledge connected with our art, almost always profusely and sometimes beautifully illustrated; not to speak of the host of other illustrated publications, bringing home to all of us an amount of knowledge of the scenes and buildings of far-off lands, often very valuable and almost always replete with interest to some of us. When I contrast, I say, these differences, what large results ought to be produced, if the industry of students is at all equal to their valuable privileges!

But notwithstanding this advancement, and in such a period of progress, it would indeed have been surprising had we all stood still. Let us turn to our charter and ponder awhile on the petition of those who asked for it.

It recites to His Majesty, King William IV., that his "right trusty and right well-beloved cousin and councillor, Thomas Philip Earl de Grey, hath, by his petition, humbly represented unto us that he and divers others of our loving subjects have associated together for the forming an institution for the general advancement of civil architecture, and for promoting and facilitating the acquirement of the knowledge of the various arts and sciences connected therewith, it being an art esteemed and encouraged in all enlightened nations as tending greatly to promote the domestic convenience of citizens and the public improvement and embellishment of towns and cities, and have subscribed and paid considerable sums of money for those purposes, and have formed a collection of books and works of art, and have established a correspondence with learned and scientific men in foreign countries for the purpose of inquiry and information upon the subject of the said art."

And I would ask, Is it certain that we have done all that in us lay "for the general advancement of civil architecture, and for promoting and facilitating the acquirement of the knowledge of the various arts and sciences connected therewith?"

Professor Cockerell, in his address of April 1860 (twenty-three years after the charter was granted), said:—"Hitherto we have looked to the Royal Academy, the Government Schools of Design, and more recently the museums at Kensington and the two colleges of the London University, for those means (of education) which they command and offer for our benefit. We hope to form schools of our own, together with those advantages, and to offer higher collegiate grades which would reward eminence and recommend by certificates to the public patronage. These last already established in the shape of diplomas in the Colleges of Law and Physic, and every learned society of the present day, prove the advantage of their being also adopted no less in the Institute of British Architects. Our funds, being of our own creation, are necessarily too moderate to embark in such increased means of instruction and usefulness as we have long contemplated, but the time is now approaching for the enlargement of these means to this effect." Whether this hope of the worthy Professor is ever likely to be realised, time alone can fully reveal.

That we as architects, absorbed in fulfilling all the arduous duties of a most laborious profession, can ever become a teaching community in the professional sense, I do not believe; and notwithstanding all that we have been told of the management of these things in France, I venture to think it is not altogether desirable that we should.

I am old-fashioned enough to put faith in the self-reliant qualities of individual Englishmen, and am afraid I must continue to think that the very eminent men whose names I have mentioned would hardly have attained their vigorous stature had they been drilled and organised in the days of their youth after the Governmental fashion, which has been so fully described to us by our secretary, Mr. White.

But those men were giants in intellect and industry, and difficulties for them would only add to the delight of final success; and it is not for such men that such systems are needed.

#### *The Examination Test.*

That the obligatory examination for Associateship with this Institution has been established is indeed a great fact in our history, and when it is made complete, as in all fairness it necessarily must, by extension, with certain exceptions, to those who, not having passed as Associates are seeking the rank of Fellows, one of the great results foreshadowed by Mr. Cockerell will, perhaps, in this most valuable sense have been accomplished.

But examinations necessarily presuppose preliminary instruction, and the question arises, Can anything be done by this Institute for its development or improvement?

Presuming that all young men proposing to enter such a profession as ours have received a complete and liberal education, I agree with the late Mr. Street in thinking that the system of pupilage which enables men to learn exactly how those who have succeeded in making their mark are in the habit of working, is no doubt the strong point of our English system; and, if it be only of sufficient duration, and is properly followed up by taking advantage during its continuance of the artistic instruction offered by the Royal Academy, and that more practical by the professors of architecture, and, more important perhaps still, the thorough study both at home and abroad of the works of the great masters of old, I believe that as much will be done as is really practicable in giving a man an entrance to what must necessarily be a course of life-long study.

But no instruction that can be devised will make men architects who have not the inborn genius to become so. It may, however, make them well-instructed practitioners, and everything that can be done towards raising the general standard of knowledge must necessarily be in the highest degree advantageous.

#### *The Architectural Association.*

Much excellent and highly commendable work has been and is still being done by our younger sister the Architectural Association, and if by any means the work of that valuable institution can be supplemented and aided by our elder body, in liberally sharing with them any advantages which our more matured status may enable us to supply, I think it would be desirable for both, and should by us be ungrudgingly given.

The President of that Association is now, happily, a member of our Council, and it is to be hoped we may always have one, at least, of its most influential members in that position, so that, while working on different lines, the elder and the younger may move harmoniously towards the common goal of each, the end so carefully foreshadowed in the preamble of our charter.

But while advocating, as I would very strongly, the utmost possible strengthening of this bond of mutual assistance, not less strongly would I advise the keeping of the two bodies thoroughly distinct.

Anything that would tend to depress the vigorous elasticity of the more youthful members would, in my judgment, be a thing to be deplored, but everything that we can do to aid them in qualifying themselves to take their places amongst us, first as Associates, and finally as Fellows, will prove, I hope, to be an un-mixed benefit.

*Papers and Meetings.*

But that, irrespective of direct teaching, the past years of the Institute have not been unprofitable in result cannot, I think, be denied by anyone who takes the trouble to peruse the record of its transactions. Mr. Eastlake's paper on this subject, read in 1860, was an exceedingly interesting and instructive *résumé* of what had occurred before that time, and I do not think the historian of the future will find the later proceedings, when carefully considered, at all less valuable.

As regards our ordinary meetings, we have been told that our proceedings are for the good of architects and not of architecture, which is true in a sense, though possibly not in that it was intended to convey. Solomon says that "Iron sharpeneth iron, so a man sharpeneth the face of his friend," and I heartily agree with what fell on a recent occasion from our friend William White as regards the knowledge to be acquired in that sense from attending our meetings; for many an observation, it may be, casually made in our rooms, has struck, and been valuable to myself for life. But while admitting that, and freely acknowledging the very great value of many of the papers read, and the discussions that followed them, there can be no doubt that in ours, as in every human institution, there is room for improvement, and it behoves each one of us, if we desire the continuance of our Society, to put his shoulder to the wheel.

Each member of the Royal Academy, when admitted within its ranks, has, I believe, to present, within the year of his admission, a work of his own, illustrative of his powers as an artist.

Would it be too much to ask of each of our Fellows or Associates, as they join our ranks, the contribution of an essay or paper on some subject connected with architecture or its practice of which he has made a particular study?

I well remember that, at the first meeting I attended as a visitor in the Institute rooms, Mr. George Godwin's valuable essay on "Concrete," which gained him a prize, was read, and I believe on that occasion, or very soon after, he was admitted an Associate. That essay stamped the character of the man, and we all know how ably and honourably it has been maintained throughout the course of a long and laborious life.

Are there none of our younger brethren equally anxious to show what they can do, and would it not be good for them and useful for us that they should take the opportunity offered by our meetings of testing their powers?

Good papers, and free and full discussions, must continue to be the life of our meetings, and the better the papers the more assured will be the reputation of those who read them; and the criticisms afforded by discussion will be alike useful both to writers and hearers.

Nothing is more important than that our meetings should be always made interesting, and if interesting they can scarcely fail to be instructive. Our aim, as members of this Institute, should be, in the words of our charter, "the general advancement of civil architecture, and the promoting and facilitating the acquirement of the knowledge of the various arts and sciences connected therewith in every possible way;" and so long as we act on these lines, our work will clearly show that the protection of our own material interests is not the great end of our corporate existence.

The honourable practice of a noble profession is what our charter requires, and should be one great object of our lives as architects; and, in my judgment, nothing is more likely to conduce to the attainment of this end than the free intercommunication of ideas, which must almost necessarily result from loyal association with one another as members of this Institute.

*Colonial Members.*

As regards our future. In the early days of the Institute, its correspondence was almost entirely limited to the Old World, and naturally so, because there alone are to be found the glorious structures of the architecture of the past; but when we consider the enormous expansion of the Greater England beyond our shores, and yet within such easy reach; when we see or hear of the wonderful cities that by the energy of our fellow-countrymen have been entirely built since this Institute was founded, it cannot, I think, be doubted that more active measures should be taken for enlarging the area of our sympathies and our correspondence, and to aid in the development of the work of those younger people, of whom so much may hereafter be expected.

Statesmen are turning their attention to the federation of the English-speaking colonies, and if the Institute of Architects can do anything to aid the bonds of union, it will, in my judgment, be a mutual benefit. Nothing is more remarkable than the clinging of the colonists of Canada, Australia, and New Zealand to the old country, and anything that can be done to foster this attachment must, I think, be a step in the right direction. Already there are in Australia and New Zealand members of our body, and we hope that their numbers may be increased, and that in India also we may be more strongly represented than at present.

While speaking on this point, I may remind you that, at our meeting of March 24 last, in response to application from abroad, a by-law was so altered as to provide that examinations can now be conducted with a view to the admission of any architects beyond the sea who desire to share in the privileges of membership.

*The Reform of the Institute.*

But, gentlemen, there is, as you are aware, a further question as to the future which requires to be faced. Hitherto I have spoken chiefly of our past and present existence as a body corporate under a charter, and have said but little as to internal government. I must confess that until I needed it for the purpose of this address, I had never very carefully studied that charter, and consequently did not know as I ought how much we were really indebted to the men who framed it. Only one of them now remains, the loved and honoured Nestor of our Institute, Professor Donaldson, and, therefore, we cannot now thank them for the pains they took in providing for its settlement. It is a very valuable document, and, for the times in which it was granted, everything that could be desired, and, as I hope I may have shown you, has been useful as a text for myself.

But times and practices have greatly changed since it was framed, and the bonds in which in some respects it holds us are hardly consistent with the expansion which in others has enlarged our view.

Whereas, in our older days, London architects were almost a class apart, and provincial men seldom wandered beyond their own cities or districts, it may now almost be said that there is no such thing as provincialism.

Our members are to be found everywhere, from the East to the West, from the North to the South, and it should be our aim to bind them all together in one strong brotherhood of mutual regard and confidence, and to make their privileges equal to our own.

Outside our ranks, also, there are able and honourable men who cannot join us, owing to minor technicalities, which we would willingly brush aside, were it not for the fetters which by our charter are imposed.

There is, further, a strong section of our body which feels—and, as I think, justly feels, now that the examination test has been finally settled—that Associates have a right to a larger share in the management of our affairs than by the charter is allowed them.

All these facts point to the necessity of change, and provided it can be prudently accomplished, I for one shall rejoice in the improvement. Naturally, as Englishmen, I hope we all detest revolution; but the best way of avoiding such catastrophes is by the timely institution of necessary reforms.

With this view, therefore, and for the purpose of meeting all questions that have lately arisen with reference to the points I have named, or otherwise, a special committee has been appointed, and is in communication with the honorary solicitor, first, as to the possibility of amending the existing charter, or of supplementing it by additions; and, secondly, failing the possibility of such changes, of ascertaining whether a charter with new provisions could be obtained without sacrificing the traditions of that which we at present possess.

These are important questions, which require time for safe solution; but I think you may rely on the desire of the Council to bring them as speedily as possible to a satisfactory termination.

A charter is undeniably a good thing. It gives to an institution like ours a breadth of base and solidity of structure such as we, as architects, ought greatly to prize.

Most of us, I hope, have some reverence for that which is old, when it has been proved to be valuable in the times that are past; and if without danger to the future we can amend and retain what we already possess, it will be the part of wise men not to let it slip.

*Competitions.*

On the subject of a recent competition you will probably expect me to say a few words.

On competitions in general, so much has been and so often said that I need not detain you by further remarks of my own.

That competitions are an inevitable characteristic of the age; that they were not altogether unknown in the earlier days of our art; and that when conducted on the strictly honourable principles such as should always characterise the practice of the architect, they are by no means the unmixed evil that some would represent has long been my own opinion, and it has not been shaken by what from time to time has been said on the other side.

I cannot myself see why, if we offer prizes to young men for the best designs or drawings produced by them as students, and which most of us think is an incentive to industry in acquiring a knowledge of their art, they should in after years be debarred from securing by similar means that employment in professional life for which their former efforts have been the best preparation.

But, be that as it may, competitions cannot be got rid of; and all we can do in this Institute is to use our best endeavours to get them conducted on sound and fair principles.

I think we are all agreed that no competition should be decided without the aid of a professional referee. This necessity is now much more frequently recognised than was formerly the case, and applications are not unfrequently made to the President or the Council for advice as to the appointment of architects as adjudicators; but it must rest with competitors themselves to insist on the adoption of this safeguard to their interests.

Human nature being constituted as it is, it is not to be expected

that any decision, however just, will satisfy all competitors; but if, instead of railing against the inevitable, men would take pains to search out the reason of their failure, we should perhaps hear less than we sometimes do as to corruption and unfairness where none may at any time have really existed.

As regards the Admiralty and War Offices competition, for the decision of which I had the honour to be selected as one of the professional judges, it would not become me to defend the action of the judges, or to criticise the views of those in authority, who prepared the instructions upon which their judgment was to be founded. I will only say this, which I believe may be taken as entirely true, that the sole object of the latter was to get the best possible building for the detailed requirements of the public service, and of the former to discuss, without fear or favour, the men best qualified to carry their instructions into effect. Whether that end has been accomplished it must be left to the future to declare; I can only say that no pains were spared by any of us for arriving at a just conclusion, and, whether our judgment was right or wrong, it was that which each one of us honestly believed to be right, and, right or wrong, it was absolutely and entirely fair.

It had been said that none of the designs selected were of a monumental character; but when a problem is put before architects, not chiefly for the production of a grand national edifice, but for the convenient accommodation in their everyday work of some fifteen hundred clerks of varying grades, all requiring the primary requisites of light and air, easy access and communications, and comparatively few of the higher officials and chiefs of departments; and practically no room needed for State receptions, and all to be got within a very limited area, it would be a difficult task indeed to combine so much of commonplace with an exterior of monumental character.

Truly, to my mind, the conditions of the problem were barely reconcilable with architectural magnificence, such as might possibly please outsiders, but be in many respects opposed to the everyday wants of the working bees to be accommodated within. Much has been, and much more will doubtless be, said in criticism of the selected design. I shall not add to those criticisms; but, to my mind, it is little short of wonderful that, whatever its faults of detail may be, so fine a plan, and so good an elevation, should have been entirely wrought out by men, solitary students in a provincial town, with no special advantages, untravelled, unknown to the world of art, and who have produced drawings of the most remarkable delicacy, which may have been equalled, but never, to my knowledge, surpassed for perfect execution. That such drawings as those submitted in each competition should have been prepared in so short a time, as I understand, by two men and a youth working together without extraneous assistance, excepting as regards perspective and figure drawing, whatever else may be said, is undoubtedly a very remarkable example of that "well-directed labour," to which, as the great first President of the Royal Academy said, "nothing is denied."

#### *Westminster Hall.*

I will not refer to any other case of competition, but it may not be inappropriate to say a few words on the treatment proposed for one of the noblest of our ancient monuments; and, just as the Chief Commissioner of Works deserves our thanks for his determination to see absolute fair play in the decision as to the new buildings, so, I think, is he to be congratulated on what he has done with reference to the opening-up and preservation of Westminster Hall.

The clearing away of the old law courts has revealed to us a picture such as we could hardly have anticipated, a vision of magnificent simplicity and proportion, which, having once seen, we can hardly bear to lose again.

The appointment of Mr. Pearson as architect for the restoration of the old building showed a wise discrimination and determination to do the best thing possible, and the very able and exhaustive report presented by him is a further confirmation of the wisdom of the choice.

But, while there can be no doubt whatever as to the necessity of the structural restoration of the great hall itself, it is permissible to regret that it should ever again be concealed from view by any new buildings, however correctly designed on the ancient lines, that may not be absolutely necessary for permanent sustentation.

I think in this case the action of Parliament is hardly to be regretted if it gives further time for the consideration of a subject of unquestionable difficulty, and one which so deeply concerns all who care, as we should do, for the preservation of the ancient monuments of this great city.

#### *Conferences.*

With regard to the conferences held in our rooms in the month of May, complete reports of which will be found in the volume of Transactions, it will, I think, be unnecessary to detain you with many observations.

Admirable memoirs were, as you will remember, read by Mr. Wethered on Viollet le Duc; Mr. Beresford Hope on Street; and Mr. Aitchison on Burges; each replete with interest for us as architects.

Valuable papers also on architectural practice were contributed and discussed by members of our own body, and visitors from various parts, the reports of which have been duly recorded, and will, I hope, be found profitable reading in the future.

Professor Kerr wound up the conference with a paper, which Mr. Beresford-Hope rightly termed "a very brilliant one," on English architecture thirty years hence; but although it was an essay of very great interest, I am not sure that the learned Professor has drawn aside the veil which covers the future so completely as he would desire; and he would indeed be a bold man who would venture to prophecy what is immediately in store for us.

I cannot but agree with him, however, in hoping and thinking, if I may quote his own words, that "it may not improbably be the destiny of England, at a period by no means remote in the development of the advancing scheme of Anglo-Saxon civilisation, to assume a leadership—such as she already possesses in so much besides—in the illustrious art which it is the pride and the joy of this assembly to represent.

I trust the gentlemen who visited us from the Provinces were not otherwise than gratified with the reception accorded them, and have taken back to their homes a pleasant and profitable recollection of this happy reunion.

The conference at the Health Exhibition stands on a different footing to that to which I have just briefly alluded, but as many of us took part in it, and a full report of its proceedings will shortly be published, I do not think I need refer to them in detail; most of the subjects treated on were familiar to us as architects, and it was rather for the benefit of the outside public than for our own instruction that the papers were prepared."

Let us hope that some few individuals out of the millions who visited the exhibition may have taken to heart a few grains of knowledge and common sense which may hereafter expand and bear fruit, and be useful to many besides those who were the immediate listeners. Perhaps, however, exception should be made in calling attention to the papers read by Mr. Aitchison and Mr. William White respectively; the former on "The Sanitary Aspect of Internal Fittings and Decorations," and the latter on "The Hygienic Value of Colour," both ably treated, and valuable alike to the architect and to the general public, if they care to profit by them.

The remarkable success of this Exhibition has indeed been one of the great features of the year now drawing to a close, and I think it may be gratifying to us as architects to know that the interesting work of one of our own members, Mr. Birch, in reproducing the picturesque features of the streets of Old London, which he has done so learnedly and well, has not been one of the least attractive features of the show.

#### *Obituary.*

Before concluding my remarks, it is right that I should say a few words on the losses we have sustained in the thinning of our ranks by death, and the position in which we now stand as regards numbers and financial prosperity.

In respect to the first, we, in common with the whole English people, have had to mourn the untimely removal of a prince pre-eminent alike in natural gifts and cultivated intelligence—one whom we had fondly hoped would not only have been an honour to our country, but of great service in all questions relating to our art—a hope, alas! not to be realised. The Council thought it their duty to present an address of condolence to our patron, Her Majesty the Queen, which in due course was graciously acknowledged.

We have also had to regret the loss, though in the full ripeness of years, of a most valuable member of our body, Mr. Knowles, a man who, having passed a most laborious life in the active performance of professional duties, might well have claimed in his declining years entire rest, but who preferred to remain amongst us as an examiner and member of Council, where I may safely say his presence was always as welcome as his opinions were valuable. His last appearance at the Council table only preceded by a few days that of his death.

In Edwin Nash we lost a most excellent man and an architect of no mean power, one always ready to help as a member of the Institute, and a genial and honourable practitioner in our craft.

He left an example in his will which may be usefully followed, in devising a legacy of 100*l.* to the insufficient funds of the Architects' Benevolent Society.

Charles Newman, less known to us, was one of my earliest professional friends; an able man who, if he had not been possessed of independent means, would probably have made his mark more strongly than he did. He has left two sons still happily numbered in our ranks.

Many of you will have known, though I did not, William Pettit Griffith, one of our Fellows, who, I believe, was very highly respected.

In Sir William Siemens not only we, but the whole civilised world, sustained the heavy loss of a prince amongst inventors, and a most genial man, always ready to impart to others, as he did to us at the Institute, some portion of that store of knowledge of which he was so largely possessed.

Amongst eminent foreigners our losses have been still more considerable; two gold medallists, Professor Lepsius, of Berlin, and Jean Baptiste Lesueur, of Paris, besides two other honorary and corresponding members, Paul Abadie, of Paris, and M. Clénard, of Lyons. And, lastly, our Honorary Associate, the eminent physician, Sir Erasmus Wilson, to whose munificence, I believe, we owe the bringing to our shores of the obelisk now standing on the Embankment.

#### Conclusion.

But, notwithstanding these losses, our numbers have increased, and we may be said, in that respect, I believe, to be in thriving condition. I believe, also, it may be very safely said that our financial condition is thoroughly sound.

Finally, gentlemen, although there are several other subjects on which I could have desired to speak, I think I have detained you quite long enough.

The past and the future of our own body is to us a theme of no little importance, and in this fiftieth year of our existence I have thought it better to confine myself mainly to its consideration rather than to wander on the wider field of survey, which might possibly, in some respects, have been more congenial both to you and to myself.

We have seen, I think, that the aims of the founders of this Institute were high and noble. Let their standard in the future be reared still higher. Their work was begun in weakness; let ours be continued in strength; and, putting aside all petty jealousies, let us combine, not for mere personal advantage, but in the truest and most literal sense, for the advancement of our art, and the establishment of its practice on that broad basis of honourable principle which alone is worthy of the noble profession to which we belong.

### AN ANGLO-ROMAN ALTAR.

A PAPER, by Mr. John Clayton, F.S.A., was read at the last monthly meeting of members of the Newcastle Society of Antiquarians, on "An Altar to Fortune Conservatrix, recently discovered at Cilurnum." The author said:—The Roman buildings recently discovered between the eastern rampart of the station of Cilurnum and the river North Tyne have been already partially excavated, and the further excavation is in progress; but the buildings are found to be more extensive and more important than was expected, and it is probable that the excavation may not be completed till the spring of next year, when a full description of the structures by an abler hand than mine, with an accurate plan of the whole, will be laid before the society. In the meantime, detached objects will necessarily be met with, which ought at once to be brought before the society. One of such objects is an altar inscribed to the goddess Fortune. The figure of the goddess is sculptured on the face of the altar. In one hand she holds a cornucopia, in the other a wheel—both of them appendages of the goddess, and generally found upon her statues. The following is an expanded reading of the inscription:—

DEAE FORTUNAE CONSERVATRICI  
VENENUS GERMANUS  
LIBENTER MERITO

The ravages of time, on the features and dress of the goddess, are apparent, but every letter is legible. The use of tied letters in this inscription indicates that its date was not earlier than the reign of Antoninus Pius, when the use of ligatures, or tied letters, was first introduced. Roman altars to Fortune are very frequently found, but the application to her of the epithet *Conservatrix* is almost unique. Only one more example is in existence in Britain, and this is at Netherby, in Cumberland, the seat of Sir Frederick Ulrick Graham, Bart. No. 763 in the *Lap. Sep.* gives an account of it. In Orellius a similar altar was described as having been found at Bath; but in the seventh volume of the "*Corpus Inscript. Latin.*" published in Berlin in the year 1873, No. 211, we are informed that the mention by Orellius of Bath as the place where this altar was found is a mistake, but that, in fact, it was found at or near Manchester, and was either lost or concealed. It is possible that the awakening of the spirit of antiquarian research in Lancashire and Cheshire may rediscover this altar, though German energy and perseverance fail to do so. The dedicator of this altar, like the dedicators of the two altars found last year at Borcovicus, is a German, serving in the Roman army—but the particular branch of the service to which he belonged is not stated—as is done in the case of the dedicators of the two altars of Borcovicus. In a postscript it was said:—After the transmission of the paper a communication has been received from Mr. Thompson Watkin of Liverpool, from which it appears that the suggestion of the rediscovery of the third altar in Britain dedicated to the goddess Fortune, with the epithet "*Conservatrix*," has been already accomplished, and has been announced to the world through the *Manchester Guardian* of June 10, 1884, in the following terms:—"Rediscovery of a Roman altar originally found at Manchester.—Mr. Thompson Watkin sends us the following:—The last certainly known of the Roman altar found at Manchester in 1612 prior to the publication of my '*Roman Lancashire*' was

that *circa* 1770 it was preserved at Hulme Hall; a pencil memorandum upon the inscription preserved at the Chetham Library states that it was afterwards in the Leverian Museum, but no trace of it appears in the catalogue of that collection. It was, therefore, with feelings of the greatest pleasure that, in going systematically through the collection of Roman inscriptions and sculptures preserved in the Ashmolean Museum on May 30 last, I came upon this identical altar. It seems that in 1875 it was presented to the museum by the Rev. J. W. Burgon, M.A., a well-known antiquary and author. How it came into his possession I am not aware. Inspection proved that Horsley's engraving of the stone was a very fair one. The inscription is exceedingly well preserved. On the right-hand side of the altar the *Petera*, in low relief, is well carved and well preserved also. On the left-hand side the *praefriculum* is plainly visible, though somewhat worn."

### GLASGOW ARCHITECTURAL ASSOCIATION.

A PARTY of members of the Glasgow Architectural Association lately visited Paisley Abbey, the new Sheriff Court Houses, and St. James's U.P. Church. Permission to visit the Court Houses was given by the architects, Messrs. Clarke & Bell, Glasgow, and under the guidance of Mr. Henderson, clerk of works, they were inspected with interest. The second of the series of lectures has been delivered in the rooms, 114 West Campbell Street, by Mr. Andrew Wells, decorator, on "*The Growth and Development of the Ornamental Arts.*" After describing the different characteristics of self-decoration, by southern savages applied to their naked bodies, and by northern ones to their garments, Mr. Wells reviewed all the historical styles, enforcing principally the necessity of understanding the influence religious symbolism has had on decorative art. Least seen in the Chinese and Saracenic styles, but very evident in the Indian and Persian, the Egyptian and early Christian, the geometric forms of the triangle, square, and circle, now the basis of most designs, even though only meant to appeal to the artistic sense, had at first a mystic significance, which must be understood ere the full value of these early decorations can be appreciated. At the conclusion of the paper, and after some remarks by Mr. Sellars, a vote of thanks was passed to Mr. Wells.

### BIRMINGHAM BUILDERS' ASSOCIATION.

THE annual meeting of the Birmingham Builders' Association was held on Monday at the Great Western Hotel. Mr. W. Sapcott, jun., presided. In the annual report of the committee regret was expressed that there was no marked improvement in the building trade. The committee further stated that in October last a notice was received from the stone-masons demanding an increase of wages; but on the representation of the committee the demand was withdrawn; and it was decided to refuse to accede to the request of the labourers for an advance of wages. The committee had terminated their engagement with Mr. W. Clulee, the late secretary of the Association, and in his place Mr. E. J. Bigwood had been appointed. A deputation from the Association had waited upon Messrs. Martin & Chamberlain with reference to the conditions of contract of the Birmingham School Board, and obtained some slight concessions. The balance-sheet showed total receipts 90*l.* 3*s.* 11*d.*, which, added to last year's balance of 65*l.* 18*s.* 11*d.*, made a total of 156*l.* 2*s.* 10*d.*, and the various disbursements amounted to 122*l.* 5*s.* 8*d.*, leaving a sum of 33*l.* 17*s.* 2*d.* to the credit of the Association. In proposing the adoption of the report, the chairman said he was sorry that the state of the building trade in Birmingham remained unaltered. It was impossible to report any improvement, for although some few large buildings were in progress, there was a general stagnation in the trade, and many men were short of employment. That the question with the stone-masons was satisfactorily settled might be gathered from the fact that they had not renewed their application. Mr. J. Bone seconded the motion. Mr. R. Mann commented upon the absence of any clauses in the Bankruptcy Bill by which sub-contractors might be protected. He was a member of the Association, and had during the last two years lost 1,600*l.* through the action of three other members. He thought that when a builder made over the value of a contract to some firm or bank, he should not be allowed to run into the debt of a sub-contractor without the latter having knowledge of that circumstance. One gentleman, a member of the Association, assured the speaker that he expected some four or five thousand pounds from a contract, and in consequence he (Mr. Mann) gave him credit, with the result that he afterwards found the money in question was due to a bank. The chairman, in putting the resolution, which was carried, coincided with the remarks of the last speaker, and urged that there ought to be in the Bankruptcy Act some clause by which any balance there might be due to a builder in connection with a contract should not be paid to anyone without some knowledge on the part of the sub-contractor. The election of officers for the ensuing year was then proceeded with.

## TEWKESBURY ABBEY.

THE restoration committee have met to consider the best means of carrying out the restoration to the Abbey Church of the chamber at the south-west angle of the nave, and the opening out an access to the south side of the church through the Abbey House property. The vicar and Mr. T. Collins presented a report embodying their proposals on both these points, which, with some little modification, was adopted by the committee. It is intended to carry these objects into effect as soon as money is forthcoming for the purpose. The work on the south side will involve considerable excavation of soil, which is now in places 4 feet 6 inches higher than the level of the nave floor, and will thus contribute materially to the permanent preservation of the fabric. The vicar and Mr. Collins were thanked for their report. The committee also expressed their opinion that steps should be immediately taken to raise the necessary fund to carry out such work (with such modifications as may from time to time be deemed desirable) referred to in the report. A sub-committee was appointed to carry out the resolution. The subject of providing a lightning-conductor was again discussed, and was ultimately referred to the churchwardens, with a hope that they would at once take steps to have one placed on the abbey tower.

## OAKLEY v. BOYLE.

ON Monday and Tuesday last, in the Queen's Bench Division of the High Court of Justice, the case of Oakley v. Boyle was heard. Mr. Bigham, Q.C., and Mr. A. C. Scott appeared for the plaintiff, and Mr. McClymont and Mr. Le Breton were for the defendants, Messrs. Robert Boyle & Son, of 64 Holborn Viaduct, and 110 Bothwell Street, Glasgow. The action was for commission said to be due under a contract of July 1881, by which the plaintiff in addition to his salary was to receive  $1\frac{1}{2}$  per cent. on all works ordered, executed, and paid for. The defendants replied first that no commission was due. Next they pleaded that, if due, the plaintiff was not entitled to recover because he entered their service by fraud, in not disclosing circumstances of his previous career, which might materially have affected their decision in appointing him their traveller in 1880. Thirdly, they alleged that while in their employ he took an agency for a patent gas-regulator (Bickerdyke's), and in attending to that neglected the defendants' work. For this damages were asked, in the form of a counter-claim. The plaintiff replied that he accepted the agency with Messrs. Boyle's consent, that he did not neglect their work, and that they were well aware of his antecedents long before he left them. On these pleadings issue was joined. The case was tried by Justice Wills with a common jury.

Mr. Bigham, Q.C., in opening the case, said the action was simple and plain in its nature, but there were painful circumstances connected with it which he would have to deal with. The name of the plaintiff, Richard Banner Oakley, was no doubt familiar to them, for many years ago he was convicted of fraud and sentenced to five years' penal servitude, the offence having been committed in connection with a bank, of which he was proprietor or manager, called the Co-operative Credit Bank. Oakley served his time of imprisonment, and purged his offence. He should not have had to go into those matters if the defendants had not chosen by their pleadings to rake up the past of the man to whom they were indebted, and to rely upon it for the purpose of finding an excuse for not paying what they owed him. When he came out of prison, he did what every man ought to do under such circumstances, he tried to get honest employment. He was fortunate enough to retain the esteem of such a man as Sir John Monckton, the Town Clerk of London, and Mr. Cartwright, well known in the City. With their assistance, he was successful in obtaining employment of a humble kind. It was under these circumstances that, in the year 1880, Mr. Oakley being then in want of employment, saw an advertisement in the *Daily Telegraph* for a town traveller. He answered it, secured an interview, gave Sir John Monckton and Mr. Cartwright as his references, and was eventually appointed at a salary of 3*l.* per week. It would be suggested that he suppressed his name, for he signed his letters R. Oakley. He commenced his duties in due course; he performed his duties so well, so efficiently, and so honestly, that he was appointed manager of the London office. So satisfied was Mr. Boyle with the way in which the plaintiff performed his duties, that he placed the control of the books in his hands, and allowed him to deal with confidential matters. Now, as to the suppression of name, he would call evidence to prove that before the plaintiff undertook these extended duties the defendants were well aware of his identity. Oakley was well known in the City before his conviction, and was not likely to escape recognition by many after his release from prison. It was therefore unlikely that the defence set up, that the plaintiff entered on the contract of employment by fraud, by concealing the fact of his conviction, was well founded, and such concealment was no excuse for not paying money which had been actually earned. It was alleged that he falsely represented himself to be Robert Oakley, but that was not so. It was true he did

not tell Mr. Boyle that his name was Richard Banner Oakley, and that he had been convicted; but surely there was nothing very wrong in that. Assuming that he had earned the money he now claimed, it would be a question for his lordship to say if the concealment of his full name was an answer to the action. When Oakley had worked for him about nine months, he had an opportunity of bettering himself by going elsewhere, and he gave notice to leave. That was in July 1881, and shortly afterwards Mr. Boyle wrote the plaintiff a letter, in which he said he should have much pleasure in bearing testimony to his high qualifications as a man of business, and also to his integrity and perseverance in whatever he undertook. Well, Mr. Boyle would not agree to part with Mr. Oakley, so a fresh agreement was entered into, in October 1881, appointing the plaintiff manager of the London office at a salary of 3*l.* per week, with  $1\frac{1}{2}$  per cent. commission on the gross amount of orders received at the London office, and executed and paid for. It was on that agreement that the present action was now brought. He would now draw attention to the pleadings. It was said first that no commission was due, but he should be able to disprove that. Next it was said that if any commission was due, Mr. Boyle was entitled to rely on the counter claim. He would deal with that shortly. But the third, and perhaps the most important plea, was that the defendant was induced to enter into the contract by fraud, and plaintiff was thereby excluded from recovering the  $1\frac{1}{2}$  per cent., having to lose that in addition to the punishment that the law gave him years ago for his offence. Now came the explanation of the defendant's conduct. In July 1882, Mr. Oakley had some overtures made to him by a company interested in some ventilating apparatus. Mr. Boyle had been asked to take over the business of that company, and had been advised by the plaintiff to do so; but for reasons best known to himself he declined. Overtures were made to the plaintiff then, and the consequence was that he gave three months' notice to terminate his engagement. Probably that vexed Mr. Boyle, but he concealed his annoyance, and seemed not to give Mr. Oakley the slightest idea that he would pursue the course he ultimately took. But just before the expiration of the notice the plaintiff applied for a renewal of the testimonial given him in the preceding year, and received in reply a letter asking what firm he proposed joining. No testimonial, in fact, was sent, and in due course the plaintiff left Mr. Boyle, but early in November Mr. Oakley paid a visit to his late employer, and was then told, in effect, that he had been guilty of fraud and all kinds of things, and that he (Mr. Boyle) would take care to let every architect and builder all over the country know who the plaintiff was. Mr. Oakley not unnaturally went to his solicitors, who thereupon wrote to the defendant threatening him with criminal proceedings if he printed libels or slanders upon their client. Mr. Boyle replied, saying that the letter much surprised him, suggesting that the account of the interview was absurd, and stating that if Mr. Oakley thought there was anything due to him (which he denied), he could put it to the test. Thus the matter stood. As to the counter-claim the plaintiff positively denied having taken the gas-regulator agency unknown to Mr. Boyle. He emphatically denied having ever neglected his ordinary work. The plaintiff was promised certain payment for the services he was to render; and on his behalf he (the learned counsel) had to submit that the defendants were not entitled to come there and say that, because of his previous character, regardless of the services he had rendered, he should be still further punished for a past offence by taking away from him his wages.

The Court then rose for the day.

On the resumption of the trial on Tuesday morning, Mr. Richard Banner Oakley was called, and gave evidence corresponding with the statement of his counsel.

The learned counsel was proceeding to examine the witness as to the confidence reposed in him by Mr. Boyle, when Mr. McClymont said they did not complain of the plaintiff's conduct while in their service; they complained that he suppressed his name when they engaged him.

Under these circumstances, Mr. Bigham said he would not continue that portion of his examination.

Mr. McClymont said that he did not think it necessary to trouble the Court with the counter-claim, and he also proposed that his client should agree on a reasonable sum for commission, providing his lordship held the plaintiff was entitled to recover.

Mr. Bigham: The main question is, are we disentitled to recover by reason of fraud?

The Judge: That is rather a question of law. It is suggested he ought to have disclosed the facts of his previous history, but I cannot see how that is an answer to a claim for commission earned.

Mr. McClymont: I have been trying to put myself in your lordship's hands.

The Judge: I cannot help thinking myself that if there is any moral blame in the matter it rests more with the referees than with the plaintiff, for he appears to have been advised by them.

Mr. McClymont: My point is this. My client says that the plaintiff came to him and represented himself as fit for a position of trust; he gave two references as to character and fitness, and

that is an implied representation that he was of the average fitness. My second point is, if a gentleman, who for any reason whatever changes his name, or, as in this case, drops a portion of it, there is an act of misrepresentation. Saying his name is R. Oakley instead of Richard Banner Oakley is what the law describes as fraud, because it is a suppression of a statement by a person when in a position in which he is bound to speak. If I can show that the referees knew who this gentleman was, knew that he represented himself to be R. Oakley, that my client spoke to and treated with him as R. Oakley, then I submit that this is a contract for commission to be paid upon orders executed, and it is not completed until they are executed. The essence of such a contract is this:—I am going to treat you as a person I can trust, confidence is the essence of the contract, and therefore I say that this suppression of fact is fatal to the contract. If that is so, then any claim under the contract is gone also.

The Judge: If there had been any serious damage alleged in consequence of the suppression, then nice questions would have been raised both of law and morals.

Mr. McClymont: You have not heard all about the morals. I have no desire to go into them.

The Judge: I am not using the word in reference to Mr. Boyle. I mean the conduct of the plaintiff and his referees. I think there ought to be good faith in any representation under such circumstances. It is quite clear that the plaintiff had the sanction for his conduct of his two advisers, Sir John Monckton and Mr. Cartwright, but I do not desire to express any opinion on it. In my opinion, with everything you can suggest there is no answer to the action.

Mr. McClymont: I could not ask anything but nominal damages on the counter-claim. I should like to know if I could succeed, in your lordship's view, in establishing my proposition that there was fraud, which voided the contract? If I cannot, I ought not to take up your lordship's time.

The Judge: I think you cannot.

Mr. McClymont: Then I will not press the matter further.

The Judge: There will be judgment for the plaintiff for 70*l.*, the amount agreed upon.

## AMERICAN TIMBER RAFTS.

TWO large rafts of pine logs have been lately brought to Cleveland, being the first floated from Lake Superior. One covers about five and the other eight acres. The larger raft contained about 3,000,000 feet of lumber, and the smaller a little over 2,000,000 feet. There were in both rafts about 16,000 logs, ranging from 12 to 16 feet in length. The rafts left a point on the south shore of Lake Superior, between Grand Marias and Grand Island, about 100 miles west of the Sault, and in a little more than two weeks reached Cleveland. They were made up in two sections each, pear-shaped, and enclosed in booms. Through the rivers the sections were towed separately, and they also went through the rapids in the same shape, without loss or damage. The run is about one mile in length, and the fall in the neighbourhood of 20 feet. The entire distance from start to destination is about 600 miles. The run from Detour was made in fourteen days, the average speed being about 1½ miles an hour.

## PHILADELPHIA.

IN the number of dwelling-houses, stores, shops, and manufactories, Philadelphia far surpasses all other American cities; and, in fact, no city in the world, says an official report, can rival it in possessing sufficient dwelling and tenement houses to afford every family one wherein to make a home. The growth of Philadelphia has been almost marvellous; the number of houses in 1683, one year after the laying out of the original plan by William Penn, was less than 100, while to-day the city contains over 176,000 buildings, to which number thousands of new buildings are being added yearly. The number of stores and dwellings erected in 1883 was over 4,000, or twice as many as were built in the previous year. Of three-storey residences, nearly 1,500 were built in 1883, an increase of 700 over the preceding year. The designs of the buildings are quite a change from the commonplace style of former years; eighty-one factories were also built during the same period.

To convey an idea of the size and importance of this city is almost impossible. It has about 1,600 miles of streets, of which over 900 miles are paved; 352 miles of tramways, 214 miles of sewers, over 700 miles of water-pipe, and about 750 miles of gas mains. Its system of sewerage is unexcelled, which is due in part to its location between the Delaware and Schuylkill Rivers. The healthfulness of the city may be attributed to cleanliness, excellent sewerage, and to the fact that the people are not huddled together as in other large cities.

The greater part of the city is built of the excellent brick for which it is noted. Philadelphia is remarkable for the abundance

of domestic comforts and conveniences, and no city of any considerable size in the world surpasses it in the home comforts it allows the people of the middle classes, many of whom occupy houses of their own. A large part of the city is built upon rented ground, the ground-rent plan as here developed affording excellent advantages to the builder. The construction of houses is also greatly stimulated by building associations, of which there are over 500 in Philadelphia. The value of real estate, according to the assessment of 1883, is 583,612,683 dollars. The city debt is about 67,200,000 dollars, for the payment of which there is a sinking fund of about 29,000,000 dollars.

The public buildings of Philadelphia are numerous, and many of them fine in architectural design. The city contains some of the finest specimens in America. The most prominent are the New Public Buildings or Departments of the Municipal Government, now nearing completion. They are of white marble and granite, covering an area of 4½ acres, exclusive of the courtyard, and will have cost when finished about 15,000,000 dollars, of which sum more than two-thirds have already been expended. The architecture is of the Renaissance, and they excel in beauty and magnitude any public buildings in America.

The new United States Post Office is claimed to be the largest structure of its kind in the world. It is a magnificent pile of granite, costing about 8,000,000 dollars.

The cathedral of SS. Peter and Paul (Roman Catholic) is built of brown stone, in the shape of a Roman cross, and is the finest structure of its kind in the country. The Masonic Temple, situated immediately opposite the new municipal buildings, is constructed of granite in Norman style of architecture, and cost about 1,500,000 dols. The University of Pennsylvania consists of a group of elegant and commodious buildings of green serpentine stone, quarried near the city. The curriculum of this institution is of the very highest grade, and its instructors the best obtainable. Among the other buildings worthy of special mention are—The United States Sub-Treasury and Custom-house, the United States Mint, the Academy of Fine Arts, the Academy of Natural Sciences, and others.

The Girard College, an institution for the free education and maintenance of orphan boys, was endowed by Stephen Girard, a citizen of Philadelphia. The college buildings, constructed at a cost of 7,000,000 dols., afford the best facilities obtainable for boarding and educating nearly 1,200 boys, who, having finished the course of studies of the college, are apprenticed to learn some useful trade or profession. The main building is a massive structure of white marble in Corinthian architecture. The total value of the residuary fund to date, with the par value of securities given, is 10,138,268 dol. 10 c., which includes college ground and buildings and all real estate owned by the trust. The Academy of Music, chiefly for grand operatic representations, is one of the most extensive and perfect buildings of the kind on the Continent, and the opera-houses and theatres of Philadelphia are capacious, handsome, and well constructed. The hotels are superior in their accommodations, and some of them unsurpassed in elegance.

Philadelphia is indeed "a city of homes." The unlimited territory open to improvement, the perfect system of tramways and steam railroad facilities for rapid transit to and from the suburbs, the straight streets extending for miles and constantly lengthening, combine to make it a delightful place of residence for all classes of people; and the productive and highly cultivated country surrounding it renders its markets equal to any in the United States. All these, added to its advantageous situation, have made it the great manufacturing centre of the Union. The rapid growth of Philadelphia and the march of modern progress has not been permitted to interfere to any extent with buildings of historic interest. The city to-day possesses more relics of the past, more edifices of historic fame, than any other in the Union. The oldest of these is Penn's Cottage.

The Old Swedes' Church is one of the most venerable edifices in America. The first church upon the site was erected in 1677, and served both for a place of worship and a block-house, being constructed with loopholes and other appliances of defensive warfare. The present edifice was built in 1700 to take the place of the old one. Christ Church is another relic of the colonial times. It was begun in 1727 and finished in 1754. Its chime of bells is among the oldest on this side of the Atlantic. On the tenor is inscribed, "Christ Church, Philadelphia. Thomas Lester and Thomas Peck, of London, made us all." When the British troops took Philadelphia, these bells were removed to prevent them falling into their hands and being cast into cannon. They were afterwards replaced, and have remained to peal forth music ever since. Washington was a regular attendant at Christ Church when President of the United States, and many of the heroes of the "times that tried men's souls" rest in its vaults.

"Independence Hall," wherein was considered and adopted, and from its portals read, the Declaration of Independence, is situated on Chestnut Street, between Fifth and Sixth Streets. This edifice, the "Mecca of American Freemen," was commenced in 1729 and completed in 1734. It is a rather modest-looking building of brick. Within recent years it has been restored, as far as possible, to the condition in which it was in 1776. The upper floors at present are occupied by the Select and Common

Councils of the city. The "Independence Chamber" contains the table upon which the Declaration was signed, and the portraits of the signers and other revolutionary heroes. The "National Museum" is in the opposite chamber; in it are collected many valuable relics of colonial days, including the original charter granted by Penn to the city of Philadelphia. West's celebrated painting, *Penn's Treaty with the Indians*, may also be seen here. There is no building of so much historic interest outside of this one. In it Washington received his commission as commander-in-chief of the American army, and in it the Articles of Confederation were adopted in 1787. Almost every name and every incident connected with the birth of the nation is associated with this edifice. It is a shrine which hundreds visit daily.

#### An Institute Diploma.

SIR,—May I ask you to insert this letter in your next issue, as the subject of it possess interest to many. I am desirous of agitating in order to obtain from architects generally a memorial soliciting the Royal Institute of British Architects to promote a Bill as early as possible in Parliament, which shall prevent all architects practising unless they have first received a diploma from the Institute, as the oldest recognised body of architects. Such a measure would in the first place further the interest of the Institute itself by giving it a more generally recognised position; secondly, it would materially improve the social position of architects; and thirdly, it would (and this, of course, is the weightiest reason of the three) preserve our English architecture from becoming more debased, by preventing men who have learnt to use their pencils in a carpenter's shop or elsewhere from setting up as architects, when they are ignorant of or at the best possess but a superficial knowledge of the science of architecture or the laws and ages that govern its styles.

Other arts are developing improvement, while this, which Mr. Ruskin justly ranks first, is yearly becoming more debased from allowing uneducated and unqualified men to usurp the name of architect, and erect incongruous, badly-proportioned, and oftentimes unhealthy buildings. Many of the men are ignorant of even the different styles of architecture, for we constantly find Classic and Gothic mingled in the same building. How can builders' clerks, small tradesmen, and, to my personal knowledge, even a railway porter, have received either the education necessary to understand or the means of obtaining such expensive books as are necessary to attain even a minimum of architectural knowledge? Yet these are allowed to adopt a profession equally with those who have received expensive educations, paid large premiums to acquire necessary technical knowledge, and afterwards probably read hard at a sacrifice of health, time, and means, in order to appreciate in some measure an art which embraces so many different kinds of knowledge, and calls into use four out of the five senses mankind is blest with.

Why should it be more necessary to preserve the few from unqualified dentists, than the many from unqualified architects? To quote Mr. Ruskin—"every man has, at some time of his life, personal interest in architecture. He has influence on the design of some public building, or he has to buy or build or alter his own house. It signifies less whether the knowledge of other arts be general or not: men may live without buying pictures or statues, but in architecture all must, in some way, commit themselves; they *must* do mischief and waste their money if they do not know how to turn it to account"—unless they employ competent men.

In this economising age, many who are ignorant of the art employ these so-called *architects and builders*; and, putting on one side the national question for a time, it is most unfair that these men should be allowed to monopolise work and money by encroaching on a profession which ought properly to be confined to those who have made it their especial study. Of course a Fellow of the Institute has some advantage over others who have not attained that standing, because many educated people in London recognise it as a diploma of efficiency; but although people in the provinces understand what M.D. means to a doctor or R.A. to an artist, most of them are ignorant of the meaning of F.R.I.B.A., or even of F.S.A. Country people are slow to understand that there are architects *and* architects, except so far as a display of wealth is concerned.

The suggested measure would *not* debar the really gifted men from attaining success, because the question of articles, which might prove a pecuniary difficulty to some, could be waived; but it *would* prevent men who neither possess a personal love or especial knowledge of the art from practising for the sake of pecuniary advantages.

The Institute has already taken a step in the right direction by

insisting on an examination. Why not follow the example of our continental neighbours, by obtaining an Act of Parliament which shall render it necessary that every architect should possess a diploma of efficiency? It would be a means of improving our national architecture, and at the same time give architects a definite position which at present they certainly do not possess. Of course the best men come to the top in time, but it often means such up-hill work as materially shortens life. How many of our best architects have died in the prime of life! If the work were confined to the profession, incomes would be increased, and the means of obtaining knowledge and experience by travelling more generally enjoyed. I have written at some length, but I hope more efficient and influential members of the profession will take the matter up, and endorse powerfully and tersely what I have so feebly aimed at.

Yours truly,

A. MORDON MOWBRAY,  
Architect, F.R.I.B.A.

Burton Villa, Eastbourne:  
Nov. 3, 1884.

#### Awards for Ventilators at the Health Exhibition.

SIR,—As we are informed that a *select* number of ventilators have been tested by the jury on ventilation, at the late Health Exhibition, for the purpose of assisting them in adjudicating the awards, we beg to state that we knew nothing of these tests until they were completed, nor was our air-pump ventilator included amongst those tested. It appears that our ventilator was not the only one excluded, as several other exhibitors of ventilators were also not invited to submit their ventilators to the tests. The result is that an old-fashioned and out-of-date cowl, which was patented some quarter of a century ago, has been awarded a gold medal; and a revolving cowl, which has proved a complete failure in a large number of cases, when practically applied, has been awarded a second prize. Now, it would be interesting to know *why* so many ventilators, ours amongst the number, were excluded from these tests, seeing that they were all sent to the exhibition for the purpose of competing for prizes.

We are afraid the jury have got themselves into a scrape they will have some difficulty in getting out of, for they may depend upon it that the matter will not be allowed to drop until it has been sifted to the bottom, and the individual or individuals responsible for these, the most extraordinary and unfair proceedings which have ever disgraced an exhibition jury, brought to book and made to account for their unexcusable and most reprehensible conduct.

We understand that the method of making the tests was a farce unworthy of the most ignorant child, the ventilators being placed inside a tube about 8 feet long by 3 feet square, and a blast of air driven on to them by means of a fan: the bottoms of the pipes attached to the ventilators were also inside the tube. It is scarcely credible that such gross ignorance amongst professed scientific men could exist in this the nineteenth century. And these are the men who are appointed as our judges!

Perhaps it may account for why we have been treated as we have, when it is mentioned that our old friend and well-wisher, Mr. J. P. Seddon, formed one of the jury, and this may also perhaps account for that gentleman's friend being awarded five medals.

Yours truly,

ROBERT BOYLE & SON.

64 Holborn Viaduct:  
Nov. 4, 1884.

#### LEGAL.

##### Supreme Court.—Oct. 30.

(Before LORDS JUSTICES BAGGALLAY, BOWEN, and FRY.)

CHATTERLEY v. NICHOLLS.

##### SALES OF LAND.

The question here was whether the informal terms of two letters constituted an enforceable contract for the sale of land. The defendant offered to sell the Westwood Park Estate, at Brentwood, in a letter, stating that he was prepared to offer it for 11,000*l.*, "subject, of course, to approval of the title and the terms of the contract," and to the estate comprising not less than 31½ acres; and in a postscript the defendant added that it must be understood that the offer must be accepted or rejected by a stated time. The plaintiff, in answer, accepted this offer in terms. In the course of a month the solicitors for the two parties agreed upon a draft contract. The vendor subsequently refused to proceed, and the purchaser brought an action for specific performance of the contract alleged to be contained in the letters. The action was tried by Mr. Baron Pollock, who gave judgment for the defendant. The plaintiff appealed.

Counsel for the appellant contended that the letters made a

contract with a condition which had subsequently been performed. The approval of the terms of the contract, which was conditional, was effected by the draft agreed upon by the solicitors.

Lord Justice Baggallay, after stating the facts, said the letters, even with the words "subject to approval of the title," might have made a good contract, but there was a material term left uncertain by the additional statement that the offer was subject to approval of the terms of the contract. Then was the uncertain term made certain by subsequent performance? The solicitors had approved the draft containing the terms, but they had no authority to bind their principals. His Lordship shared Mr. Baron Pollock's regret that advantage had been taken of a trifling want of formality, but as the respondent had not been heard, it was possible that there was a satisfactory explanation. The appeal must be dismissed, with costs.

Lord Justice Bowen very much regretted that he was obliged to come to the same conclusion. The respondent's explanation had not been heard, but it appeared as if he had either behaved badly to the other side or to his solicitor.

Lord Justice Fry was of the same opinion.

#### Sheriff Court, Perth.

BURKE v. TAIT.

EMPLOYER'S LIABILITY.

In this action the plaintiff, who was a labourer, sued a builder for 500*l.* for injuries arising out of the fall of a building on August 12, when there was a great storm. Several men, including plaintiff, were more or less injured while working at the foundation of the new building by the roof and wall of an old close immediately adjoining giving way and falling above them. It was alleged that the accident was occasioned through the close being undermined in the course of the operations, and left in a faulty condition. The action was defended on the ground that Burke was partly to blame himself, and that if the foundations from underneath had been dug out, they had been dug out with his knowledge; and further, that the accident occurred during a severe storm, and might have been occasioned by it. The defendant, however, on the action being raised, offered the sum of 120*l.* and expenses in full of all claims, or three years' wages, and since the case was called the pursuer had accepted that offer. A decree was accordingly given for that sum.

#### Supreme Court of Judicature.—Nov. 3.

(Before SIR JAMES BACON.)

FOSTER, PORTER & CO. v. COOPER.—COOPER v. FOSTER, PORTER & CO.

These were cross actions, the first brought by Messrs. Foster, Porter & Co., warehousemen, carrying on business on the west side of Philip Lane, in the City of London, the second brought by Mrs. Cooper, the owner of the Old Yorkshire Hotel, on the east side of the same street. Both actions asked for an injunction against the respective defendants, to restrain them from interfering with their ancient lights. The houses on both sides of the street were burnt down in the great Wood Street fire in December 1882. The surveyors on the plaintiffs' side were Messrs. Walter Greaves, J. P. Smith, Edmund Woodthorpe, Baker & Wilkinson, and Christopher & White; for the defendants, Messrs. Gruning, Skingle (of Messrs. Farebrother, Ellis & Co.), Chatfield Clarke, and Banister Fletcher.

After a trial which lasted for five days, the Vice-Chancellor dismissed Mrs. Cooper's action with costs, and Messrs. Foster, Porter & Co.'s action without costs.

#### Wandsworth Police Court.—Oct. 30.

(Before MR. PAGET.)

BUILDING IN PRIVATE WAY.

Mr. W. Beale, of Lombard Road, Totteridge Road, Battersea, builder, was summoned by the Metropolitan Board of Works for that, on or about July 26 at Lombard Road, he did unlawfully, without having first given three months' notice of his intention to the Board, and without the sanction of the said Board first obtained, form and lay out a road, passage, or way for building as a street in such manner as not to afford direct communication between two streets, contrary to section 7 of 45 Vict. c. 14.

Mr. Thomas Burton, solicitor, appeared for the Board, and Mr. Lyon, barrister, for the defendant.

Mr. Burton stated that the defendant had erected a block of buildings in Lombard Road, in a *cul de sac*, and, to avoid the above Act, had placed gates at the entrance. The Board contended that all ways formed must have a communication leading into another main street, unless dispensed with by the Board; and that although gates had been erected, the Act applied, and it had been so held in the case of the Board v. Hampton, heard at the July Surrey Sessions, and called the surveyor of the Board and Mr. Pilditch, surveyor of the district board, in support.

Mr. Lyon contended that the Act did not apply, that the way was a private one, and that, not having been dedicated to the public, who would be trespassers if they went over it, the Board had no *locus standi*.

Mr. Paget, in delivering judgment, said that the place being closed by gates, he should hold that this was not a street laid out for the purpose of foot traffic, and therefore that no consent to its formation was required, the more especially as it was not dedicated to the public, and he should dismiss the summons.

Mr. Lyon applied for and was allowed 5*l.* 5*s.* costs.

Notice of appeal was given by the Board against the decision.

### CHURCH BUILDING AND RESTORATION.

**Rishangles.**—The parish church of St. Margaret, Rishangles, has been reopened after restoration. The church is one of the oldest in the county of Suffolk. The work of restoration has been carried out under Mr. Arundell Tagg, architect, by Mr. Grimwood, builder, of Weybread.

**Chatham.**—The ancient parish church is to be pulled down and rebuilt in accordance with the plans of Mr. Blomfield, the cost of the work being estimated at 5,000*l.* The present church holds a congregation of 900 persons, but the accommodation in the new one will be for 750 only, as there will be no galleries in it. Care is to be taken for the preservation of the ancient monuments, of which there are several in the existing church.

**Pembury.**—A Wesleyan chapel has just been opened. The building has been erected by Messrs. Penn, of Pembury, the architect being Mr. S. M. Houghton, of East Grinstead. Accommodation is provided for about 150 persons.

**The New Parish Room** adjoining All Saints' Church, Clifton, Bristol, is fast nearing completion, and on Saturday next the corner, or memorial, stone is to be laid by the Right Hon. the Earl of Devon. The ceremony will be followed by a public luncheon. The architect is Mr. E. Henry Edwards, of Bristol.

**The New Buildings** in connection with the All Saints' Choir School, in All Saints' Road, Clifton, are all but completed, and during the week the ceremony of blessing the building was performed by the vicar, the Rev. R. W. Randall. There was a large attendance of clergy and laity. The architect is Mr. E. Henry Edwards, of 5 Clare Street, Bristol.

### ARCHÆOLOGY.

**Roman Antiquities in Germany.**—A series of excavations have been carried out, at intervals, during the last twelvemonth on the site of an old Roman castle, near Rottenburg, in the Black Forest. The ground plan of the castle has been, at least in its main features, opened up, the course of the outer walls, the position of the doors and gates, the chief portions of the interior buildings, and in some places very considerable remains of the old fabric have been brought to light. During the latest operations some extensive remains without the lines of the castle have been discovered, all the ground plan and foundations being perfectly preserved. Among them is a hypocaustum, or subterranean calefactory, which is in a state of completeness almost unprecedented.

**South American Antiquities.**—The Ethnological Museum at Berlin has been lately enriched by a fine collection of South American antiquities, which had been gathered during many years by Herr Mehring, a German resident in Brazil. The collection is almost wholly composed of objects which have been disinterred from burial mounds and similar places, and includes axes, arrow-heads, lance-heads, all of stone, and generally of most perfect workmanship; monumental stones, earthenware utensils, and some painted pottery. There are two pipes, evidently used for smoking, made of baked clay, the bowls representing caricature faces. Besides these ancient objects, Herr Mehring has also presented to the museum a very numerous collection of modern utensils, weapons, and ornaments, obtained from South American Indians.

**Competition.**—At a meeting of the Llanelly School Board, held on the 14th ult., Mr. E. H. Lingen Barker, of Hereford, was unanimously appointed architect, and his plans for the new school buildings in the Lakefield Road for 750 children accepted. Mr. Lingen Barker's design was placed first in the recent competition by Mr. C. H. M. Mileham, of Essex Street, Strand, the professional assessor appointed by the Board, the following being an extract from his report:—"This design is the work of a skilful planner. It is well arranged, the style simple, and is no doubt the most economical." There were sixteen other competitors from various parts of England and Wales.

## NEW BUILDINGS.

**Kilbarchan.**—A new hall for evangelistic purposes has just been erected, and will accommodate about 500 persons. The hall has been erected at the cost of Mr. Thomas Williamson. The architect was Mr. Louis Shanks, of Glasgow.

**National Liberal Club.**—On Tuesday the foundation-stone of this building was laid by Mr. Gladstone, which is at the Embankment end of Whitehall Place, opposite the Hôtel Métropole. The site has an area of 23,750 square feet, and has been leased from the Crown. From the main entrance, at the corner of Whitehall Avenue and Whitehall Place, a vestibule leads into the hall or principal corridor. To the left of this is a reception lobby, and beyond a postal and telephone office; a second hall leads into the conference-room, which is 38 feet by 34 feet in dimensions. A separate entrance from Whitehall Avenue gives members direct access to this room. A handsome elliptical staircase opposite the main entrance rises from the basement to the first floor. A passenger-lift will afford easy means of reaching the different stages of the building. Below the ground-floor is to be a spacious smoking-room, with a bar, and beyond under the terrace will be a range of billiard-rooms. In the basement also will be provided a boiler-room, an engine-room containing the dynamo machine for electric lighting, and a fresh-air chamber forming part of the system for ventilation. One other entrance is to be added from Whitehall Place under a tower in the north-east angle of the building, for the benefit of such non-members as may be privileged to use the Gladstone library, which will be placed in a room 102 feet in length, 35 feet wide, and 24 feet in height, with shelf space for 20,760 books. On a level with this apartment will also be a smaller members' library, a grill-room, 63 feet by 35 feet, and a dining-room, 38 feet wide by 108 feet in length. From the dining-room there will be access through an open loggia to a broad terrace 30 feet wide overlooking the Embankment. Reading and writing-rooms, private dining-rooms, and a committee-room are among other apartments on the first floor. Upon the second floor are the bedrooms. The structure will throughout be fireproof, the exterior entirely of Portland stone. The estimated cost is 120,000*l.* In style the building is to be Early Renaissance, the most noticeable feature being the tower, which will be 180 feet in height. The architect is Mr. Waterhouse, A.R.A.

## SCHOOL BUILDINGS.

**Stafford.**—The memorial-stones of Primitive Methodist new Sunday-schools, Snowhill, Stafford, have been laid. The site has been obtained by pulling down two cottages at the rear of the chapel, and here will be erected a commodious building, having on the ground floor three good class-rooms and an infant's school-room, and above them, on the first floor, a large school-room. Two vestries are being constructed between the chapel and the new building, and provision is also being made for the lengthening of the place of worship at a future time. The work is being carried out by Mr. W. Pemberton, from the designs of Mr. J. D. Mould, architect.

## ART WORKMANSHIP.

**Stained Glass.**—A window in the Late Decorated style has been inserted in the west gable of the south aisle of St. Margaret's Church, Uxbridge, and filled with stained glass in memory of the James family. The window was designed by Messrs. Charles J. & C. Herbert Shoppee, architects, of Doughty Street and John Street, Bedford Row, London. The stained glass is by Messrs. Clayton & Bell, of Regent Street, the subject being the Ascension. The window is in five lights. The glass to the lower part of the centre light represents the journey to Emmaus; the two to the left "Noli me tangere," and the angels and Marys at the sepulchre; and those to the right the charge to St. Peter and Pentecost. The stonework was carried out by Messrs. Fassnidge & Son, of Uxbridge.

## ENGINEERING WORKS.

**Gridiron Groynes.**—Two groynes, of a form invented by Mr. Dowson, are about to be constructed at Brighton in order to test the merit of the principle. They may be described as a fence of iron hurdles, each hurdle about 5 feet long and 3 feet high, secured to iron stakes or piles driven into the ground. With the exception of the top and bottom rails, the bars of the hurdles are all placed vertically, and have open spaces between them about an inch in width, which (where they are not buried with shingle), allow the water to pass through, and it is thought that by this means the backwash of the waves on the lee side of the groynes will be reduced. The gratings are nevertheless sufficiently close to intercept the travel of the shingle, and the intention is that when the beach has accumulated as high as the top of the hurdles, they should be dug out and drawn up so as to heighten the structure as much as may be thought necessary, the piles or stakes being also heightened or drawn up to a higher level, and this

process is to be repeated until the whole beach has been raised by the repeated accumulation of shingle to such an extent as may be desired. The groynes will be about 200 feet long, and are expected to cost 300*l.*

## GENERAL.

**M. Jacques Galland** has obtained the prize offered by the French Government for a design for a tapestry border to surround four panels, representing the Seasons, and to be executed at Beauvais. M. Galland is a pupil of his father.

**A Picture**, by Mr. G. F. Watts, R.A., *Rain Passing Away*, was purchased at the exhibition at the Manchester Art Gallery for 200 guineas.

**The Midland Arts Club**, Birmingham, opened the winter session, last week by a social gathering of the members. A large collection of works of art by members of the society and others were exhibited.

**The "Art Journal,"** which is to be reduced in price from 2*s.* 6*d.* to 1*s.* 6*d.*, will, in January next, appear in a new cover designed by Mr. Lewis F. Day, who designed also the present wrapper of the *Magazine of Art*.

**The International Exhibition**, in New Orleans, will not be opened until December 16. Applications for space will be received until November 25, and exhibits until December 10.

**A Cast of Aphrodite of Cnidos**, by Praxiteles, in the Vatican, has been added to the gallery of casts at South Kensington.

**The First Commissioner of Works** has stated, in the House of Commons, that the new buildings of the National Gallery are being pushed on as rapidly as possible. The trustees are not in favour of lighting up the galleries at night.

**The Royal Technical School** in Berlin was opened on Sunday. The main building is 665 feet long, 170 feet deep, and 80 feet high, and will accommodate 2,000 students. The total cost has been 340,300*l.*

**The Citizens' Association** of Chicago offer a prize of 500 dollars for the best practical essay on the "Main Drainage, Sewerage, and Water Supply systems of Chicago and its vicinity."

**Mr. Hicks**, architect, of Newcastle-on-Tyne, has prepared plans for an organ-chamber to be erected in the parish church of Newburn, with a new organ as a memorial of the late vicar.

**Mr. W. H. St. John Hope** delivered a lecture on "The First Norman Cathedral Church at Rochester," at the opening meeting of the Maidstone Philosophical Society.

**A New Franciscan Monastery** will shortly be commenced at Upton, Essex; the architects are Messrs. Pugin & Pugin, of Westminster.

**The Tynemouth Town Council** have decided to proceed with an extension of the Fish Quay eastward, at an estimated cost of 27,000*l.*

**The Waghorn Memorial Committee** have decided on erecting a bronze statue at Chatham, representing the pioneer of the overland route in his uniform as a naval lieutenant.

**Messrs. R. Pearse & Co.** have been awarded the silver medal for wrought-iron casements at the Health Exhibition.

**Mr. H. Mitchell**, of Bradford, has offered to contribute 3,000*l.* towards the erection of Sunday School buildings in connection with the Wesleyan Chapel at Manningham.

**The American Elevator Co.** have obtained the order for a second goods lift for the warehouses of Messrs. Elliott Bros., Sydney, N.S.W. It is to have a capacity of 15 cwt., and is to carry a load of nearly 80 feet.

**An Ancient Roadway** of oaken logs, supposed to date back to Saxon times, has been found in course of some excavations at Ipswich. The stratum upon which the oak logs rest is of peaty earth, apparently made up of furze, heather, broom, alder, birch, &c., matted together to the depth of about a foot, and there is probably little doubt that these were laid down to form a road over a swamp.

**An Extra Parliamentary Committee** has been appointed to elaborate the principal conditions of the Paris Exhibition of 1889, and to decide upon its site. The Committee includes the Under Secretary of State for Public Works and for the Colonies, and also the Governors of the Bank of France and of the Crédit Foncier.

**The Glasgow Town Council** propose to borrow 50,000*l.* for alterations and extensions of the Central Police Office, and for the erection of a new police office in the northern district of the city.

**Deep Artesian Boring.**—Chalk has been struck at the depth of 524 feet at a tube-well which Messrs. Le Grand & Sutcliffe, of London, are boring for Mr. R. L. Curtis, at Vange, near Pitsea, in Essex. Much uncertainty existed as to the depth necessary to go to reach chalk in this locality. The London clay extended to 395 feet, and the lower tertiaries are altogether 129 feet thick. It is expected the total depth to be bored to obtain a good supply of water will be somewhere over 600 feet, and at the present rate of progress it is anticipated this will be completed within the next three weeks.

# SUPPLEMENT

TO THE

# ARCHITECT.

## CONTRACTS, COMPETITIONS, AND TENDERS.

LONDON, NOVEMBER 8, 1884.

### CONTRACTS OPEN.

BRADFORD.—Nov. 10.—For Building Post Office. The Postmaster, Bradford.

BRADFORD.—Nov. 17.—For Extension of Thornbury School. Mr. E. P. Peterson, Architect, New Inn Buildings, Thornton Road, Bradford.

COCKERMOUTH.—Nov. 11.—For Rebuilding Brewery. Mr. R. S. Marsh, Surveyor, Cockermouth.

COLCHESTER.—Nov. 12.—For Building Branch Co-operative Store, New Town Estate. Mr. J. F. Goodey, Architect, Victoria Chambers, Colchester.

EBBW VALE.—Nov. 13.—For Building Master's House, Briery Hill School. Mr. L. P. Jones, Victoria Road, Ebbw Vale.

FORDINGBRIDGE.—Nov. 17.—For Building Lodge, Coach-house and Stabling at Highfield. Mr. Fred. Bath, Architect, Salisbury, and 342 Strand, London.

GREAT EASTERN RAILWAY.—Dec. 1.—For Works and General Repairs and Alterations for 1885. Mr. John Wilson, Engineer, Liverpool Street Station.

GREAT YARMOUTH.—Nov. 15.—For Building Two Cottages. Mr. W. B. Cockrill, Architect, Glencoe House, Gorleston.

HALIFAX.—Nov. 18.—For Building Mill and Construction of Reservoir. Mr. C. F. L. Horsfall, Architect, Lord Street Chambers, Halifax.

GRUNDY'S PATENT  
WARM-AIR  
VENTILATING FIRE GRATE.

The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.

TESTIMONIALS.  
"9 Victoria Chambers, Westminster, S.W.  
"June 10, 1884.  
"SIR,—I have much pleasure in testifying to the efficiency of your patent Warm-Air Fire Grate. It has been very successful, and given every satisfaction where I have used it.  
"Yours, &c.

"To Mr. Grundy."  
"Baptist Chapel, Clapham Common, London. Richard Webb, Pastor, 10 Grafton Square.  
"February 15, 1884.  
"DEAR MR. GRUNDY,—I have pleasure in testifying to the excellency and efficiency of your patent Fire-Grate. It is the most charming invention for heating a large room I have ever known. I shall have pleasure in showing it to anyone who wish to have their schools or rooms pleasantly and efficiently heated."

From James Garry, Esq., Architect, West Hartlepool, July 1884.  
"DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocon Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.  
"Mr. John Grundy."

# BELL'S ASBESTOS.

## BELL'S ASBESTOS FLOORING FELT.

This article is manufactured from specially prepared Asbestos fibre, and by its use any building can be rendered comparatively fireproof at a very small cost. This material should be used as a substitute for brown paper under the carpet, and it can be taken up and relaid as often as required; it may be laid between the flooring boards, on the ceiling before plastering, and on the walls. Doors of pine or other wood should be so constructed as to have a sheet of the felt in the centre, so that either side being burned the other remains intact. In houses so protected fires would be localised to the rooms in which they originate. Asbestos felt, being a non-conductor of heat, is superior to any other sheathing, and used under slates has no equal. It yields no dust, lies quite flat, is soft to the tread, and its low cost places it within the reach of everybody. Made in rolls of 36 inches wide.

**BELL'S ASBESTOS BOILER AND PIPE COVERING COMPOSITION** for coating every class of steam pipe and boiler. Non-combustible, and easily applied when steam is up; adheres to metals and preserves them from rust; prevents the unequal expansion and contraction of boilers exposed to weather; covers 50 per cent. more surface than any other coating, and is absolutely indestructible. It can be stripped off after many years' use, mixed up again with 20 per cent. of fresh, and applied again. The composition is supplied dry, and only requires to be mixed with water to the consistency required for use.

A horizontal boiler, 17 ft. 6 in. long, 15 H.P., gave the following results:—

Temperature on Plates ..	186 deg.
"          Covering ..	94 "

One ton of coal was saved per week, and, although the fire was raked out every evening 20 lbs. of steam were in the boiler next morning.

The following testimonial refers to this covering:—

Dear Sir,—It may interest you to know that we have exactly 40 per cent. in fuel through using your covering.—Yours truly,  
W. SANTO CRIMP, C.E., F.G.S.

**BELL'S ASBESTOS PAINT**, for floors, stairs, and all interior woodwork, to prevent the spread of fire. This paint is especially useful in cotton mills, and in fact in all factories and buildings exposed to risk from fire. It is quite free from poisonous ingredients, and is both easily and cheaply applied. Bell's Asbestos Paint has, on several occasions, done great service in preventing the loss of life and property. The great fire in Buchanan Street, Glasgow, in November last, produced the following testimony to the value of this material:—

Offices of the *Glasgow Herald*, the *Weekly Herald*, and the *Evening Times*.

Mr. John Bell, Glasgow, Nov. 14th, 1883.  
Sir,—As one of the means that helped to save our buildings extending from Buchanan Street to Mitchell Street from the recent great fire, I think it fair to say that your Asbestos Paint, which was applied to the outside hoist of the *Evening Times* case-room and other portions, gave valuable proof that it materially aided in resisting the flames from the immediately adjoining tenement while the fire was rapidly destroying it and threatening us in the most serious form. Since the fire, and to assure myself further of the value of the Asbestos Paint as a fire-resister, I placed a piece of wood, with your paint put on more correctly than in our case, into one of our furnaces, with the result that it was brought out without a fibre of the wood being touched, while similar pieces of wood, thrice coated with Irish Lime, at once got into a flame.—Yours truly,  
(Signed) ALEX. SINCLAIR.

**BELL'S ASBESTOS SASH-LINE CORD** is unaffected by heat and damp, and renders unnecessary the use of metallic wire and chains. Ropes made in the same form have great tensile strength, and being indestructible by fire are of incalculable value for fire escapes.

## BELL'S ASBESTOS.

The goods of this house are of the highest quality only, and no attempt is made to compete with other Manufacturers by the supply of inferior materials at low prices. All orders must be sent direct to the undermentioned depôts, and not through agents or factors.

**BELL'S ASBESTOS AND INDIA-RUBBER WOVEN TAPE AND SHEETING** for making every class of steam and water joint. It can be bent by hand to the form required, without puckering, and is especially useful in making joints of manhole and mudhole doors on boilers; also for large "still" joints, where boiling fat and steam have to be resisted. It is kept in stock in rolls of 100 feet, from  $\frac{1}{4}$ -in. to 3-in. wide, and any thickness from  $\frac{1}{16}$  in. upwards. Manhole covers can be lifted many times before the renewal of the jointing material is necessary. The same material is made up into sheets about 40 in. square, and each sheet bears the trade mark, without which none is genuine. It is very necessary to guard against imitations of this useful material, and to secure themselves against being supplied with these less useful articles at my price, users are recommended to see that every 10-ft. length of the Asbestos Tape purchased by them bears the trade mark.

**BELL'S ASBESTOS CEMENT** for the backing of firebricks and furnaces. The use of this fireproof material saves the expense and annoyance occasioned by the repairs so constantly required in the firebricks and kitchen ranges of private houses. Any labourer accustomed to handle other cements can apply this.

**BELL'S ASBESTOS BOILER PRESERVATIVE**.—This useful mixture, by absorbing the free oxygen that is in the water, entirely checks pitting and corrosion. It also disintegrates incrustation so immediately as to prevent its adhering to the plates. Not only is a great economy of fuel effected by keeping boilers clean, but the risk of having the plates burned is thereby obviated. It has been computed that 1-16th inch thick of incrustation causes a waste of 15 per cent. of coal;  $\frac{1}{8}$  inch thick, 60 per cent.; and  $\frac{1}{4}$  inch, 150 per cent. Thus the Preservative avoids the great risks which are inseparable from scaled plates, lengthens the life of a boiler, and covers its own cost a hundredfold by economy of fuel. It is entirely harmless, and has no injurious action on metals. It can be put into the feed tank or boiler, as may be most convenient. Sold in drums and casks bearing the trade mark, without which none is genuine.

**BELL'S PURE ASBESTOS CLOTH**, for protection against the spread of fire. Iron curtains warp, and in the great emergency of fire will often be immovable. Asbestos cloth, being incorruptible, will remain strong and flexible for an indefinite period, and will stay the progress of a fire and the passage of smoke longer than any other known material. This cloth is also extensively used in Maignen's unequalled water filters, for which a gold medal and diploma of honour were awarded by the Special Commission appointed by Her Majesty's Government to receive the reports of the International Juries at the Fisheries Exhibition. By special arrangement with Mr. Maignen, his filters for houses, factories, and towns are supplied by this firm.

**BELL'S ASBESTOS BLOCK GAS FIRES**.—The Asbestos Block Gas Fire is formed by placing inside the ordinary grate a hollow block (burner), composed of Asbestos, and perforated. An iron sole-plate, with a single gas burner, is fixed at the bottom of the block. After being lighted a short time, both the block and asbestos fuel throw out intense heat.

**BELL'S ASBESTOS FUEL** for gas fires. This genuine Asbestos Fuel is composed of the finest hand-picked Asbestos, and its weight is about half that of any other Asbestos fuel.

**BELL'S SPECIAL LONDON-MADE ASBESTOS MILLBOARD**, for dry steam joints, made of the best Asbestos fibre, is well-known for its toughness and purity, and is absolutely free from the injurious ingredients frequently used to obtain an appearance of finish, regardless of the real utility of the material. Made in sheets measuring about 40 in. square, from 1-64th in. to 1 in. and  $\frac{1}{2}$  millimetre to 25 millimetres thick. Each sheet bears the Trade Mark.

# The Architect.

## A DIPLOMA FOR ARCHITECTS.

HERE are certain questions in the architectural world, as elsewhere, which come up periodically for debate, and one of these is already well known, and ought by this time, one would think, to be well understood, by the name of the diploma question. It has been, indeed, so often considered that many will say it needs no further discussion. But nevertheless it is a subject which—at least up to the present time—however frequently and perhaps inconveniently it may claim to be taken up afresh, we cannot afford to treat with-

out respect; for the object in view, no matter what may be thought of its feasibility, is an honourable one. The urgent letter of a correspondent, which we printed last week, brings the proposal for a "diploma" once more before the profession, and perhaps may be said to do so in such a way as to represent, as well as ever has been done before, the practical rather than theoretical arguments which are relied upon by the advocates of the measure.

Our correspondent is an architect in practice at one of the most thriving of our popular seaside towns. He is a full member of the Institute of Architects, writing F.R.I.B.A. after his name for the last three years, and frankly claiming consideration for the title. Here is precisely the sort of person who is likely to complain of the want of such consideration, and to put the case in a way that is wholesomely suggestive of the attitude of those whose competition in business compels him to remonstrate. It is just in such a town as Eastbourne that the "architect and builder" flourishes to the advantage of the builder and the detriment of the architect. It is here that the cabalistic initials of Institute membership are emphatically not understood. It is here that "builders' clerks, small tradesmen, and even a railway porter" are "allowed to adopt the profession" of an architect, not only without rebuke, but, what is more, with "a fair field and no favour" in the rivalry of business. CARLYLE says somewhere that the King is the *canning* one, the man who can; and, in such a secluded little kingdom as this, what is to prevent the railway porter—once "at the bench" we should suppose—from asserting a right to be a king architectural *if he can*? Mr. MOWBRAY says "an Institute diploma," backed up by an Act of Parliament, ought to prevent him: and that is the question.

It is almost a pity that our correspondent goes so far out of his way as to quote Mr. RUSKIN; but it is fortunate for the present argument that the poet's observations are not very much to the point. Of all influences in the world, the advocacy of Mr. RUSKIN would probably weigh least with a hard-headed House of Commons in promoting the success of "a Bill which shall prevent all architects practising unless they have first received a diploma from the Institute." Neither is the writer so happy as could be wished in the too sober explanation which, in this Ruskinian connection, he gives of architecture, as "an art which calls into use four out of the five senses mankind is blessed with;" these being, if we may hazard a guess, the senses of sight as regards art, hearing as regards acoustics, feeling with reference to matters of bodily comfort, and smell in things sanitarian. But, apart from these trifling exaggerations of sentiment, the issue which is raised is a fair and intelligible one, and, as such, is entitled to be discussed once more.

Now there are two perfectly distinct questions involved in this issue, if not three, as our correspondent puts the case. First we are called upon to say why the works of building which are executed for the general public of a country like England should not be compulsorily graceful, in homage to that advancing taste which is now coming to be recognised as a public principle. Secondly, we are required to consider how far the same works of building should be allowed to be improperly planned, constructed, lighted, warmed, ventilated, and drained, to the detriment of the health, comfort, and convenience of the inmates. Thirdly—if such be intended—we are to say whether it is not for the advantage of the public interest that a profession of specialists, expensively educated for their

specialty, should be "protected" (as the phrase goes in economic science) in the practice of their business; but this we may pass by.

The general or miscellaneous answer to all such questions is that this is a free country, in which every man is allowed to earn his living as he honestly can. But (say the objectors) is it honest for one to earn his living, or rather another man's living, by pretending to know what he does not know? Speaking broadly, the answer is that, in the eye of the law, it is honest. But is not this particular eye of the law its blind eye; what, for example, of the doctors and the lawyers? Well, even the blind eye of the law has sight enough to see that a bad doctor will kill the body, and a bad lawyer kill, in a manner, the soul; and therefore these are exceptions excepted. Then what about dentists? Mr. MOWBRAY's argument about them is a mistake; the "railway porter" may change from architect to dentist to-morrow, no man but his patients daring to make him afraid. So also with the Church; any man may preach who can get a congregation. So also with the art of war; any one who will enlist, and is worth enlisting, may have his bellyful of fighting. And so, likewise, any one may paint portraits if he can find sitters; or produce statues if he can get people to buy them; or fiddle to his heart's content if any one will listen. Even in organ-grinding of a purely philanthropic character we draw the line in the most timid and dubious way.

To come to particulars, ought England, in the first place, to recognise architectural fine art—let us say some reasonable amount of academical grace in building—as a matter of public policy, so as to forbid the exhibition of that which is offensive to some sort of public taste? No doubt, if building affairs could be so managed in the interest of general enjoyment, that everything should be pleasing to the eye of the wayfarer, the sum of the national gratification would be largely augmented; and, if this happy consummation could be only but partially accomplished, of course the people would so far unquestionably benefit. Then (say the advocates of the diploma) let the Government at any rate do what can be done towards so good an end, and give to educated experts some kind of authoritative recognition or license which to uneducated inexperience shall be refused. That there is something in this no one can well deny. Accordingly, Government gives to the Royal Institute of British Architects a charter; the Institute gives to examinees a certificate; is it really affirmed that this certificate is worthless?

Secondly, how far can public authority interpose for the prevention of unintelligent construction? As regards health, we need not observe, a great deal is being already done. But it is only through the instrumentality of public officials; and the adoption of any scheme of personal license for professional practice seems quite impossible. Here again, academical examinations exist in plenty, sometimes almost in rivalry; and, amongst the rest, the Institute of Architects has recently begun to act up to the occasion.

But there is a wide difference in any case between a certificate of competency from an examining body, and a statutory license from the public authorities; and, under the policy of government which is universally accepted in England, this difference is even wider than it would be in some other countries of Europe. Perhaps it may be right to say that the apathy of the English public with regard to academical degrees is one of their weak points; and that the French, for instance, with their worship of distinction in the form of *gloire*, and the Germans with their appreciation of it in the more mathematical or quantitative manner, are so much in advance of us practically that the precise value of every man of any intellectual mark may be estimated by all about him from the diplomas he can produce. In other words, we may admit that a professional man in France or Germany is able to satisfy the public that he is an expert, as distinguished from a pretender, by referring to documentary evidence which is understood by all persons of education, whereas the same man in England would find his certificates, however numerous they might be, regarded as little else than ornaments to his character which he ought to be able to dispense with. It is the consciousness of this state of the English mind, probably, that forces the advocates of prohibitive legislation for the architectural profession to fall back upon such a resource. But it must be manifest to all who have their eyes open to what goes on in the Legislature that an Act of Parliament which would prohibit the employment of an architect who failed to

show a license to practice is a thing not to be thought of. The desired "diploma," therefore, must be identified with the certificates which we already possess, amongst which the title of membership in a professional guild is probably the most available of all; and the appreciation of such a guarantee must be left to the advancing intelligence of the public. People's apathy, after all, is not so very great as to render membership of the Institute of Architects, as a matter of rank, of no value whatever; and, for the rest, the possessors of such rank who wish to turn it to legitimate account must learn how to do so for themselves. The hint is at least worth offering that one of the best means of accomplishing the object is the establishment of local architectural societies, if only for the purpose of excluding pretenders; another is the encouragement throughout the provinces of the extension of Institute membership and Institute examination.

## M. ZOLA ON PAINTING.

[BY A CORRESPONDENT.]

IT would be vain to deny that the name of EMILE ZOLA is held in dis-esteem in England, and probably some apology is needed for recognising him as an authority on art, or on any subject that is not connected with the life described in his novels. The question, however, is what amount of truth is there in M. ZOLA's theory of art? and in considering it one is not called upon to condemn or to approve of the series of books in which the natural and social history of a family under the Second Empire will be found. Son Excellence EUGÈNE ROUGON is a personality partly drawn by the help of imagination, and we can compare the creation with those of other novelists; but EDOUARD MANET was a living painter, over whose works many a battle was fought in Paris. Even if M. ZOLA slandered Imperialism by showing its fruits in ROUGON, that is no reason why his eyes and his judgment should be at fault when he described the pictures of MANET which were kept out of the Salons. So many men have laid down the laws of æsthetics, we need not grumble if a French novelist adds a volume to the heap. Several men will follow his example who have given less thought to the subject.

M. ZOLA was born in Paris in the April of 1840, and eighteen years afterwards he began the battle of life on his own account in the city. His aspirations were towards poetry, and, strange to say, towards philosophical poetry. He was an embryo LUCRETIUS, and might be classed with the young men of genius whom he describes as having a love of the Enormous, a continual want of the Infinitely Grand. But even in Paris the Muse will not preserve her votaries from hunger, and M. ZOLA was sometimes forced to turn fowler in his garret and ensnare the sparrows on the roof. He had other expedients. There is no bread in the world that is so dry as the Paris bread when one is forced to make it the sole staff of life, but M. ZOLA got over the difficulty by steeping it in oil. Loaves must be paid for, and, like many a scholar from the days of CLEANTHES, he was forced to keep his bed when his coat was in pawn. If M. ZOLA had lived *au premier*, he might have persevered in efforts to reach a hazy sublimity; but the sight of the housetops of Paris is enough to make any man a realist, especially when the spectator has hunger for a companion. So M. ZOLA abandoned the Infinite, and resolved to be a *prosateur*. His first sacrifice to materialism was the acceptance of employment in a publisher's shop. Then he wrote stories and novels, and in course of time was made famous.

When M. ZOLA startled the decorous world there was a risk that French literature and art might fall into a stagnant condition. Respectability was advancing to so high a position in the State that even wit was afraid to meddle with it. But as Eastern poets have become wearied of the everlasting monotony of the heavens, and have expressed a desire to see the stars strewn in new ways, so in Paris and in sight of the Tuileries there were men who grew dissatisfied with the extension of authority, and were unthankful when they saw how authors and artists could be moulded into tools as easily as prefects. M. ZOLA was one of the disaffected. Fashionable painters who drew inspiration from the Court, and approved of imperial face powders and millinery professors, who taught the safest doctrines, juries, critics, the public itself were all condemned by him. Not only was the Emperor declared to be unqualified to become

the biographer of JULIUS CÆSAR (who, according to some, was a kindred genius with His Majesty), but the ancient and modern authorities who had so benevolently laid down the laws for artists were regarded with irreverence. "La science du beau," wrote M. ZOLA, "est une drôlerie inventée par les philosophes pour la plus grande hilarité des artistes." Is it any wonder that such a writer did not gain renown at once?

In the former generation the contest between the Classic and Romantic men was an effort to substitute one party for another. It did not follow that all the combatants were brave or were worthy to take part in the warfare. In those cases organisation becomes *la puissance des impuissants*. M. ZOLA has been as much opposed to one side as to the other. He is the champion of individualism in art, and therefore both Classicists and Romanticists are his enemies. A realist himself, he wishes to see realism in pictures; not, however, the photographic accuracy which goes under that name, but rather such a treatment of a subject as will denote fidelity to the artist's own conviction of what is true. A painting should, according to him, be characteristic of its author not by its mere mannerism (which might mean its departure from nature), but by its power to express the strength of his insight. No two men see things in the same way, and M. ZOLA would be the last to expect that the representations of inanimate, much less animate, nature by several artists should have the correspondence that would be seen in the plates produced by an equal number of photographers.

There are accordingly two factors in M. ZOLA's system of æsthetics, which allow of no meddling with them. They are Nature and Man. TENNYSON says that knowledge is but what we see, and M. ZOLA would give a similar definition for art. It is the world which is about the artist that should form his source of inspiration. Hence M. ZOLA is as much opposed as MR. RUSKIN to the system adopted by the late GUSTAVE DORÉ, whom he looks on as a magnificent improvisatore, who lived in an ideal world, and was always ready to produce work without a thought of nature. DORÉ abandoned the use of the living model, and eventually, however hard he might try, he could not be realistic. His drawings of London life are as far removed from nature as his scenes in fairy-land. He had more or less fitness to undertake the illustrations of DANTE and MILTON, but, according to M. ZOLA, he should have waited for a long time before undertaking the Bible. Giants and dwarfs, fairies and demons, vegetation of an ultra-tropical character, in a world which has been subjected to extraordinary convulsions, an architecture which is independent of laws of construction, all these things were produced without effort. But his hand could not embody a representation of any character for which a human being cared, and consequently there were many books which he was incompetent to illustrate. Scenes of pageantry, fables, and that class of subject which is described in the North as "uncanny," were all within DORÉ's range, but with MOLIÈRE or GOLDSMITH he was out of his element. M. ZOLA says that DORÉ's talent consisted mainly in his peculiarly picturesque dramatic imagination. By a rapid intuition he was able to seize the most interesting point of an event, and what was dominant in character. His mind was obeyed by his hand, which drew figures almost as quickly as they were imagined. But there was a limit to his dreamland. Things were either seen in an atmosphere of delicate, subdued light, or under sombre shadows. The infinite variety which realism affords was almost unknown to him. M. ZOLA, therefore, implored DORÉ to turn more to nature if he wished to do justice to his own genius.

The qualities in which M. DORÉ was deficient are strongly marked in the works of EDOUARD MANET, who might be called the god of M. ZOLA's idolatry. The founder of the Impressionist School found some admirers among picture buyers, but we doubt if any of them has been able to see the beauties in the artist's works which are apparent to M. ZOLA. In the first place, there was a sort of sympathy between the novelist and the painter. Both were described as black sheep. The story is told of a journalist who was introduced to MANET in a café, but who looked around, as he was unable to believe that the modest, somewhat dandified, little man near him was the terrible fellow who was supposed to shock the proprieties. Then, again, MANET was so often attacked that it seemed as if the whole established world of art was in arms against him. "It is a struggle," wrote M. ZOLA, "between an artistic temperament and the crowd, so I attack the crowd, for I shall be always on the side of the vanquished." In this case he was prophetic.

MANET obtained some followers among artists who were young and clever, and his influence has not died with him, but the pictures which draw the biggest prices are not in the Impressionist manner, and are not entirely realistic.

M. ZOLA maintains that, while the artistic temperament is variable in every individual, Nature remains constant. Why should the artist abandon truth for the sake of conventionalism? Every great artist should be, as it were, a translator, and express what he sees according to his own personality. What interests me as a man, says M. ZOLA, is humanity, and it is the recognition of humanity that gives interest to a painter's work. Accordingly we find him admiring MILLET, but turning aside from CABANEL. One had sympathy with his subjects, the other regarded them with the coldness of official eyes. M. MILLET was a peasant, who used the brush instead of the flail. M. CABANEL was the representative of a system which had emperors and kings for patrons. The *Venus of Milo* is a fine figure, but who would care for the statue if it had been produced by a machine? Is it not almost as mechanical if we know that the sculptor was only the product of a system of training?

M. ZOLA's teaching lies open to the objection that in his search after realism and individuality he is indifferent to beauty. He judges of pictures too often from a novelist's standpoint. Any one who has frequented the vapour baths of Paris, knows that there is a vast difference in physique between Frenchmen and Englishmen. In Paris there are far more figures which are badly formed. A corpulent shopkeeper might delight the eyes of a Japanese caricaturist, but a sculptor who had copied ordinary models would turn aside. Yet however ungraceful their contour may be there is plenty of character among those men, and consequently they are of interest to a novelist like M. ZOLA. It does not follow that traits which can be turned to account in verbal descriptions are equally well adapted to be depicted on canvas or recorded in hard marble. M. ZOLA admits that French people are neglectful of the exercises which give strength and beauty to the human frame, but somehow he fails to recognise the fact that an imperfectly developed form cannot be attractive to an artist, unless he is in one of those strange moods when, as in the case of LEONARDO DA VINCI, even disease cannot be passed by. There is little of the spirit of humanity in the pictures by M. DUBUFFE or M. GÉROME, two artists of whom M. ZOLA does not approve; still the most realistic painter cannot fail in his heart to appreciate the graceful lines which make up the figures.

From what we have said, it will be evident that M. ZOLA is a zealot. He sees one side of the shield and maintains there is no other. He would impose his theories of literature on painters and sculptors, and probably on architects. Like all men who are in earnest, he has done good, and French pictures are more often than formerly tested by truth to nature in form, colour, and subject. But from fear of objections, imagination is often pinioned; and instead of painting whatever is exalted in life a French artist very often has recourse to the commonplace incidents in porters' lodges and fourth-rate cafés. M. ZOLA's theories deserve attention, but it would be unwise to set up a man who confesses that he cannot tell whether a form is correct or not as the only infallible authority on painting.

## THE ARCHITECTURAL ASSOCIATION.

THE second ordinary meeting of the Association was held on Friday evening, the 7th inst., Mr. Cole A. Adams, president, in the chair. A vote of thanks was passed to the various firms who had lent exhibits on occasion of the opening conversation. Mr. J. D. SEDDING read a paper on

### The Modern Architect and his Art.

In approaching the consideration of the modern architect and his art I feel, to use Mr. Lowell's recent words, that there is little chance of beguiling a new tune out of the one-stringed instrument on which we have been thrumming so long. Without, however, affecting to say anything new "where everything has been said before, and said over again after," I desire to draw attention to a view of our art which has been singularly neglected, and which, to my mind, deserves infinitely more prominence than any words of mine can give it.

What I have to say about modern architecture refers not so much to its archæological triumphs, its teeming types and annual revivals, nor to anything that therein is, but to that therein is *not*. So, also, what I would say about the modern architect refers not

so much to his wide knowledge, his daring anachronisms and matchless manipulations of historic ornament, but to his shortcomings—not to how he bewitches the general public by what he is, and what he could do if he tried; but to how the intelligent public may fairly be disappointed by what he is *not*, and what he cannot do. In a word, it is as to the scope—or perhaps I should say the limitation—of modern architecture and the ideal of the designer (if he have any) to which I wish to draw your attention.

There is, I am aware, some danger attached to the criticism of a close profession like that of architecture, which has a royal charter dating from the 7th year of William IV., and which knows how to consume its own smoke. As, however, my point of view is quite an impersonal one, and my remarks general, and as I come before you without a single half-brick in my pocket to heave at anybody, my harmlessness is manifest. I shall then speak my humble mind with all the directness I can command, and trust to your kindness to take no offence where no offence is intended.

It is idle to shirk disagreeable questions, and so I begin with a simple proposition which covers much of the ground we shall traverse to-night. Is architecture, as practised by the modern architect, worth living for? It is a question I have more than once asked myself, but I am not candid enough to confess to you what reply I gave to it. In placing it thus in the forefront of this paper, let me say that the very last thing in my mind is to propagate doubt in the fold of the faithful where none exists; or to shake the confidence of such practitioners as are satisfied not only with the prospects of modern architecture, but with their own prospects and with the worth of their own contributions to the great volume of immortal art. To my mind the question is most suitable to the present time. I will not say that a "crisis" is approaching in the affairs of architecture, because the phrase has lost all its potency by frequent repetition in the newspapers, where we understand that a "crisis" occurs in national affairs every second day. But I will say that these are critical times for us. A strange calm has come. There is a sense of impending change. This is a time of felt uncertainty, of stranded purposes, of searchings of heart—a time when the issues of things connected with the arts of design are hanging in the balances. This is a time, too, of disillusionising alike for architects and for people, when we ourselves are not quite so confident about our method of pushing architectural design forward by means of impulses of an essentially fleeting nature, and when people are beginning to realise that every branch of architecture is well represented by outsiders, and when they are beginning to question the *raison d'être* of the architect at all.

This question is, then, a practical one, and one which it is desirable to face and to answer. It at once puts the modern architect and his art in their right place. It makes us compare ourselves not with ourselves (which is not wise), but with the masters of old who brought trained powers, sleepless ambition, and passionate devotion to their work. It has this good effect, moreover—it at once breaks the spell of that direful boia-constrictor of art, mere professionalism. Yes, and in addressing it to the Architectural Association I cannot forget that I am speaking to those to whom the destinies of English design are to be committed, and it is for you to ask yourselves how you view and how you estimate the art you follow—whether you look upon architecture as a divinely inspired art that can rightly claim all the devotion of your being, or whether you take up architecture merely as an honourable profession and a gentlemanly calling. If you take up architecture as your vocation, to be followed with the ardour of a religion, I am not sure that you will succeed in gaining riches or fame; you may have to be happy with small opportunities and small gains, and have to live a life of quiet, unnoticed worth. But you will be happy and contented and grateful all the same. If, on the other hand, you go in for architecture as a profession which only needs the efficient handling of a T-square and ruling-pen, you may, if you are a good, steady fellow, rise to be an eminent practitioner. And if you are a successful practitioner your rewards are great: you may have access to the best society and to the best columns of the *Times* newspaper; you may be a lion at evening crushes, and wear brown velvet; you may pose as the patron of the very Fine Arts, and be a judge of *bric-à-brac*, and a connoisseur of Queen Anne teapots, Chippendale chairs, and such like; you may even hope to be the F.S.A. and the F.R.I.B.A., and even the P.R.I.B.A., if you have paid your subscription and are alive when your turn comes. Nay, if as architect and surveyor you have a sufficiently large and lucrative city practice and have time for such things, you may aspire to reach the souls of the people by the art of your tongue as well as by the art of your hand, and almost succeed in adding M.P. to your other titles. And to win these rewards you have only to be a rough-and-tumble ordinary man of the world, with a head on your shoulders, an eye for figures, a well-supported air of general competency, good business qualities, some power of gracious fooling, and the faculty of turning out just what the world expects from you with promptitude and despatch. But as for art, and the mastery of the crafts, and the power of colour and form and all that sort of thing, you may neither have any, nor need your friends ever suspect that such things come within the make-up of the modern British architect!

Of course it is ever the snare of enthusiastic youth to press

inconvenient speculations home, and it is because I am in the presence of the aspiring fledglings of artistic gifts and good parts who form the Architectural Association, that the question as to the innate worth of modern architecture comes before me. In another place—where the birds are not only fully fledged but have feathered their nests, and, like Jeshurun, are not exactly able to soar—I dare not hazard it, nor you either. Let it not be supposed that I have low opinions about architecture, or that I would willingly shake the allegiance of any young heart that has found peace in its pursuit. Let no waverer be downhearted; there may be a lucrative future before him. Let him stick to his last, by which I mean his T-square and ruling-pen.

To proceed. I said just now that this question touching the worth of modern architecture as a serious life's pursuit puts our art in its true place. Instinctively one feels that while it is applicable to the modern architect and his art, none but a fool would have put it to William of Sens, Jocelyn of Wells, Alan of Walsingham, William of Wykeham, Thomas Chard of Glastonbury, or of Bramante, Michael Angelo, Christopher Wren, Inigo Jones, or Adams or Chambers, and there must be a reason for this.

Again, none but a fool would ask the modern musician, or the sculptor, or the painter or poet if his art were worth living for. Indeed, here are living arts, each with its ideal conception to symbolise, each with its mission to stimulate, delight, and console mankind, and to raise men's minds out of money-grubbing grooves into a less selfish, less sordid, less commonplace atmosphere. It is significant that in each of these cases the artist is his own craftsman; he thinks his own thought, clothes it himself, and spares no pains in the elaboration of the clothing. He keeps no ghost, and if he does he is not thought to be respectable. But the architect's ghosts are legion—on his premises and off them—and he is not one whit ashamed. In calculating the place and mission of the modern architect, one is reminded of what is happening in the bee-world just now. By the aid of an ingenious patent, ready-made cells are stamped out in wax (adulterated of course) of the correct shape and size, and when placed in the patent hive the bees forthwith complete the cells and fill them with honey. And the very counterpart of this is happening in the human world; the royally-instituted architect makes the cells, and the decorators and manufacturers fill them with honey. You know quite well that the English people have not to thank the British architect for the poetry of their homes. You know that one of the noblest provinces of architecture, that of turning necessary articles of daily use into works of art, has fallen from the architect's hands. You know that all the pretty things that dignify modern life come from "the largest furnishing establishments in the world" in Tottenham Court Road—from those homes of champagne and shoddy where the red sealing-wax "Early English" furniture, and the wood coal-boxes adorned with roses and daffodils, and the cast-iron over-mantel china-closets come from; where you may get a dozen very cheap high-class native oil paintings at one counter, and a dozen very dear native oysters at another.

Again, we must confess that the other contemporary arts I have enumerated have been affected for the better and not for the worse by the influences of the day. Each has won new triumphs, each has found out new chances of appeal, new domains for display. But not so architecture, for while it has gained nothing it has lost nearly all. In respect of the use of iron for constructive purposes and of patent sanitary appliances, which builders and sanitary engineers have devised for us, we score something. Yet, however blessed the iron joists and D-traps are, and however lucky we are to be able to use them, the architects of old, who knew them not, were infinitely more accomplished all-round men than ourselves; and I do not know that, after all, our houses are either more stable or more sweet and wholesome for body and soul to inhabit than the old homes of old England.

But further. The practice of these arts of colour, sound, form, and word directly conduce to the development of artistic genius; nor could you be a successful composer if you had no musical genius, nor an eminent literary man without literary genius. Yet you can be accounted an eminent architect, and reap all the honours of the profession, without possessing or feeling the want of artistic genius.

In putting the case thus strongly, do not suppose that I am blind to the noble gifts and genius of certain architects working with us and shedding their helpful influence amongst us at the present time; and, but for my resolve to keep this paper impersonal, I would name them and speak of them with all the genuine admiration and respect I feel for them. Do not mistake me on this point; I speak of rank and file, and not of these. And I ask whether architecture as now practised ought not rather to be accounted as a "useful" than as an "ornamental"—or, as some would call it, a "fine"—art? I ask whether architecture can any longer be termed the "Queen of Arts," when all that remains of her is the skull and the feet and the palms of her hands?

I ask if it be not true that architecture has ignominiously resigned her throne, lost her honours, and bartered the sceptre of pre-eminence with which she has held sway from time immemorial, and only reserved for herself the sovereign right of levying a tax of 5 per cent. on other men's labours? I ask whether it is not true that the engineer has (whether civilly or uncivilly it matters

not, as the thing is done) robbed the architect of one-third of his domain on the one side, and whether the decorator and manufacturer have not between them robbed him of another one-third on the other side? I ask whether the architect of to-day is, or need be, anything more than a paper-draughtsman to sit on a stool and invent new sorts of doors and windows? I ask whether his business in life is not that of a designer of shells of houses for decorators and manufacturers to finish and furnish, and who varies this jackal occupation by occasional jobs for an engineer, who hires him to do the "pretty" upon a bridge or railway-station? Yes; and such of us who like to see iron skeletons clothed in shoddy ornament may, after refreshing our bodies, refresh our souls at the York or Bristol railway station, and realise at the same time the mission and scope of the modern architect and his art.

Now if you think that what I am saying is approximately true, you will agree with me that it is high time the position of the modern architect and the issues of his art were overhauled; and when this shall be undertaken, I know no better place for the investigation than under the roof of the house which contains the royal charter granted expressly to a certain institution for the advancement of architecture and the various arts and sciences connected therewith. If it be for the better advancement of the arts and sciences that architects abstain from personal relations with them, then it must be granted that they are, with much self-denial and self-abnegation, fulfilling the obligations of the charter under which they are enrolled. However this may be, I cannot help saying that, to my mind, every celebration of the Institute commemorates not the marriage but the divorce of architecture from the arts and sciences connected therewith. I have laid before you evidence of this in what has already been said, and it would be easy to go on multiplying the proofs. Indeed, it is an undeniable fact that the arts and sciences which of old were ever indissolubly connected with architecture, have passed to the care and conduct of the specialist and the manufacturer. The British public goes to its shops and specialists for any matter connected with domestic art; and if you are a parson with wants, you go to an ecclesiastical shop, and while one shopman is fitting on your coat, or taking the shape of your parsonic head for a new stiff hat, you can be ordering of another shopman a sculptured reredos, an altar and font and lectern, and that sort of thing. Yes, and I saw a striking letter the other day, written by the head of a well-advertised carving establishment, which stated that, inasmuch as not more than half a dozen of the writer's architect clients could prepare their own details in an artistic manner, he had started an office and a staff of clerks to do for the architects what they could not do for themselves. And remember that the architects here referred to were of the Gothic school, which represents the best masters of detail. Even in the matter of building houses, the better sort of builder has his own staff of draughtsmen (or compiling copyists, as some would call them), who can invent new sorts of windows and doors, and draw convenient plans, and make pleasing combinations of coloured materials after the approved fashion. The public may soon begin to inquire wherein the architects' clerks and the builders' clerks differ. The State, as you painfully know, has a very summary way of dealing with the architect, inasmuch as it entrusts its buildings to the engineers and officials of South Kensington, and maintains an office of salaried draughtsmen for carrying out public architectural works. And what is happening at Kensington, where engineers combine with ornamentalists to carry out the State's architectural works, may happen in other cases; for the public will see that, given a good builder, an engineer, and an ornamentalist, any building is possible. And the architect has only his own sloth and incapacity to thank for a state of things which in process of time will assuredly work his own extinction. The experts he has called into existence have silently undermined his position. He called in aliens to help him in his need, and the alien army is a standing menace to his position, and will in time dispossess him. Lacking science and lacking art, he is just nowhere if the scientist and the artist combine for his effacement. There is a good deal of what Mr. Ruskin would call professional "bow-wow-wow" talked at our conferences and in the journals about the rights and wrongs of the profession; but what cares the world about the architect so long as its wants are somehow supplied? Although we abuse it, the world is fair in this respect, it values us at its own valuation of our worth. It knows we keep ghosts, and it makes no nicely-drawn distinction between an "expert" and a duffer!

But in order to clear the way for some few practical observations I must arrange the subject under three heads:—(1) What is architecture, and what were the functions of the architect in old days? (2) When, and from what cause did the change from the old to the new system take place? (3) Is it possible for architecture under its present conditions to be carried out upon the old lines, and, if so, by what means? Here are three points, each of which would serve as a theme for a long lecture, so that my treatment of each must needs be brief and simply relative to the matter in hand.

As to the first point, although addressing a professional audience, I cannot define architecture as building erected after an architect's design. One might as well say that the snuff-maker

was the final cause of the human nose! There is building which is, and building which is not, architecture; and I would define architecture as imaginative building: in other words, building which expresses the invention or imagination of the builder, and which appeals by this means to the imagination of the spectator. If it is to answer to the description of architecture, the building must have a soul as well as a body. The body is the structure answering to the primary purpose of its erection, and this body should be stable and convenient. The soul is that superimposed something extra to the body—that something which is provided beyond the demands of mere utility, and which is really the expression of the builder's thought and his mode of appeal to the sympathy and imagination of the spectator. In this definition you get the three cardinal virtues of architecture represented, namely, stability, which relates to science; convenience, which relates to good sense; and beauty, which relates to taste.

Naturally, the primary purpose of a structure, combined with other like conditions, settles its character and the fit extent of its decoration; and yet, while it is quite fair to define the word architecture as the art of building nobly and ornamentally, you cannot gauge the value of a structure by the amount of its ornamentation. Dance, who built old Newgate, was an architect, and, although his structure has dead black walls of rough-hewn granite, relieved only here and there with niches and statuary, and a savage repellent air, it is imaginative building, and speaks directly to the imagination of the spectator of violence and doom in the true grim Northern manner. A mere builder would have put plain brick walls. And architecture all the world over has the same characteristic qualities—however different the types and the styles of the art represented, however different the scale of the structure, however different the culture and aims and methods of the builders—the architecture carries the impress of thought or invention, or imagination befitting an ornamental art. Architecture is truly a human art, a volume and record of human thought. As long as the structure remains, you connect with it the memory of the men who built it. For instance, the monumental art of the west front of St. Albans Abbey is a more lasting memorial of its reputed father—our only British architect—than the cracked bell at Westminster. And so with other immortal specimens of other immortal artists, “soft-handed” or otherwise. As you look at the architecture of Egypt and Greece you associate it with its authors. The work is steeped in thought, instinct with invention, and—so far as its ornament is concerned—eloquent of pleasurable labour. It represents problems of proportion. Ideas are expressed with mathematical accuracy. In Greek art we have, as I need not remind you, the science of building united with accuracy of design and execution. The arts and sciences are here united perfectly. The tide of tradition is represented in full volume, and the designer is the exponent of traditions that commenced in Egypt, and flowed onward through the Greek and Roman and every other period till broken by the Gothic revival.

As I have just said, the architecture of the modern world answers, in all essentials, to the architecture of the ancient world, however different its aims, and character, and mode of appeal. With regard to the latter point, the Classic is a more intellectual art, and demands a more intellectual appreciation. The Greek architect is a man of complete culture, learned in philosophy and geometry, and he addresses his peers. This explains why it is that some of us find the heights of Classic art cold, and the atmosphere that surrounds it bleak and grey. The modern architect, like the ancient, is the right man in the right place; and, whether he be cultured or uncultured, prince or ploughman's brother, he is the most skilled man in the building crafts upon the job. The difference is that, being a Christian, he is no respecter of persons, and being a modern he is no respecter of calculated academic rule, but speaks his thoughts simply and spontaneously, and addresses his art both to learned and unlearned, to rich and poor, to bond and free.

But now, as I turn aside to define the functions of the architect under the old system, I at once feel the ground shake beneath my feet. For who can forget the storm of 1874, after Mr. Fergusson's unfortunate deliverances in the *Quarterly Review* upon this very head? The story of that time affords, I think, a really valuable glimpse into the secret motives of the British architect. The veil lifts for a moment, and he stands revealed with the touchstone of his art in his hand. Directly the elevated position, the professional status and social level of the architect is threatened from below, an army of “soft-handed gentlemen” rush to the rescue. Never in the annals of art (or the history of the Institute, which is the same thing) had so much power of eloquence, so much literary talent, and so much genuine enthusiasm been evinced. The British workman was supposed to be on the march to Conduit Street to demand enrolment as a Fellow of the Royal Institute, and to be, in this way, there and then constituted into an architect; and, although under the pressing exigencies of the case the parish beadle from the neighbouring church, in all the majesty of his Sunday clothes, had been hired to watch the portals of No. 9, and although the Fellows had constituted themselves into a vigilance committee, in day and night relays to guard their Magna Charta, something dreadful might have happened had the

threatened invasion taken place. After all, however, the “un-emanicipated” British workman stirred not, but abode in his breeches, where I will return to him anon. Looking back at the pitiful affair (and the literature of the episode is innocently printed in the Institute's Transactions “by order of the Council”) I have only one remark to make, namely, that whereas the architects were preposterously alarmed lest the workmen should become architects, it never struck them to try themselves to become master-workmen, and so to gain the respect of the workshops by their own eminence in the crafts rather than by giving themselves airs because of their professional status and soft hands.

Luckily for me, it is immaterial to our purpose to inquire as to the social status of the architect as a person, or whether he had soft hands or hard. One thing is certain about him—cultured or not cultured, hodsman's cousin or not—he contributed the requisite amount of knowledge and theoretical science, and did not retain experts; he was in direct contact with the work as it grew up; he saw how things were done, and was not the mere figurer of details at an office; he was the familiar spirit of the building, and not the distant dictator of its details. And besides having a general knowledge of handicrafts, he was master of at least one. Some architects were modellers, some carvers, some workers in marble or in gold or in ivory, and, plainly enough, we can infer that they worked in workshops, and not in offices or studios. “In Greece,” Winckelmann says, “the best workman in the most humble craft might succeed in rendering his name immortal.”

Let us turn for a few moments to Italian Mediæval art, for we know so much more about the architects of Italy than of those of any other country, and they afford us a ready type of men whose functions covered every matter pertaining to construction and ornament. The Italian architect was engineer, builder, painter, decorator, sculptor, modeller, metal-worker, goldsmith, and the rest; or at least you might expect that the same man could paint a picture, carve a subject, draw and model a bit of ornament, make a gold casket or an urn, design a dress or a fabric, build a church or a palace or a bridge. Thus we see how wondrously the arts were interwoven and technical skill was diffused in Mediæval Italy. One craft overlapped the other; there was no hard and fast line of demarcation between them as with us, and no professionalism, and no Salvation Army of specialists behind the scenes. Naturally, the poor Italian architect had never heard of the Native Asian, American, African, and other styles so familiar to our classes of design; but, had he professed to design any sort of building, he would not have left it to the expert to fill it with plaster-work or marble or wood inlays, or bas-reliefs and colour devices; and his art would extend to the provision of gorgeous chests and furniture, and perhaps even to the dresses and portraits of his esteemed clients. Think of Da Vinci, with his superb power of colour and form, of his magnificent designs and projects in art and mechanics, and set this man with his marvellous range, his almost superhuman grasp of mind and boundless ideal, against our puny selves poring over our D-traps, and ventilation, and quantity-taking, Metropolitan Building Acts, &c., &c.; and if, after instituting the comparison, you are satisfied with the scope and issues of the modern architect and his art, then I think you are eligible to be a Fellow of the Institute without further ado, and I will give myself the honour of proposing you on the first convenient occasion.

Now you cannot properly account for the high condition of Italian art in the Middle Ages by saying that the Italian people are a phenomenal people with art in the blood. If so, art would be flourishing in Italy at this time, and it is not. The fact is, that whatever art you examine of any period, or of any country, you will invariably find that the excellence of the work is only commensurate with the ideal. There is no luck, no chance about it, it is a simple matter of cause and effect; and if the members of the Institute had as high an idea of architecture, and of the various arts and sciences connected therewith, as they have of the privileges of the profession and of their professional status, English architecture would be very different to what it is. It needs no prophet to foretell that so long as the modern architect contents himself with grovelling views and consumes his soul in small things, so long will he grovel and do small things. In Italy in the Middle Ages there was a grand ideal to animate the artist and to sustain his art. Of course many things conspired to favour art there and then, beyond the consanguinity with artistic races which doubtless had its effect. Italy was then what England is now—the world's emporium, the seat and centre of the world's commerce. There was wealth, and the desire to spend it upon beautiful things. There was the ambition of cultured nobles. There was the inheritance of fine traditions. There was a lovely climate and a flowery land. There was the innate passion for beauty of a passionate and beautiful people. But what raised Italy to her high-water mark of art was the measureless value set upon execution. What Winckelmann said of Greece is equally applicable to Italy—the best workman in the most humble craft might succeed in rendering himself immortal. The designers themselves were masters in the crafts they dabbled in, and they had technical knowledge and technical skill. “Design” then meant something more than it at present does in an architect's office, or in our classes of design. It meant the power to *do* as well as to *draw*. It meant executive power and technical skill. It

meant that what the brain of the man could conceive, that the hand of the man that conceived it could execute.

Coming to our second point. We have to inquire when and from what cause the change from the old to the new system of architectural practice took place. And here we must come back to our own country again, first, because we are speaking of English art, and secondly, because a similar change has not come over the architectural practice of other countries. I will begin by saying that the old system had lasted in the world generally from the building of the Tower of Babel to the time of the Gothic revival. Ever since English architecture was English architecture, it had been born and bred and fostered and propagated in English workshops. The Gothic revival meant not only confusion to architecture, but death to the art of the workshop. I do not mean for a moment that the art of the workshop, or the craft carried on there were of a high order before the inauguration of the new condition of things, but I speak of one system of design as opposed to the other. How could the arts of design flourish then, when, from the king on his throne to the merchant on his stool, no one cared one dump for art? Why the very life of art, its sinews, its flesh, and its bones is the living thought it contains, and the living interest it creates. If there were no demand for literature, language would not be cultivated. If there were no dancers, the piper would cease to play. Will the crafts develop their cunning if there is none to order and none to heed? It was not patronage only that was wanted, but employment. People, when they are uncomfortable about the results of the Gothic revival, are fond of pointing to Gower Street as a justification for the annihilation of traditional art. But you may depend upon it had there been the demand for higher things there would have been the supply. However homely, or, if you like, however ignoble, the art done just before the new stimulus came, the traditions of the better times still lingered on in the workshops, and the bricklayer, the carpenter, and the plasterer who hung on were men with some notion of style and some love of detail. The early Queen Anne had its leanings towards the picturesque Elizabethan, and the houses of the period are singularly well adapted to English minds and English scenery, and their fittings are in nowise unworthy of the best traditions of the English workshop.

I have purposely made this digression in order that I might insist upon the fact that so long as the traditional art remained in force, and the workshops were the nurseries of design, so long the old scope of architecture, and the connection of the architect with the crafts were maintained. And, while on this point, let me remark upon the significant fact that while certain architects still adhered to traditional art, English architecture gained no advantage by their adhesion; nor did they themselves strike oil, and for the simple reason that, like the Goths, they swamped the traditional art of the workshop with their new-fangled types and rolls of details prepared by the soft-handed clerks in their offices, and accomplished the complete strangulation of traditional art. So it comes to pass that the tale of honoured names of English architects passes on to Pugin, Barry, Scott, Street, Butterfield, Shaw, Pearson, Bodley, and Philip Webb, and leaves them—shall I say?—inconspicuous in the crowd.

But I have yet to account for the decay of architecture before the Gothic revival, and also for the change from the old to the new system of architectural practice; and the explanation I offer for the one applies to the other. I have shown how low the arts had fallen at the beginning of this century through neglect, and I cannot see that you could expect that art should engage men's attention when you remember the vast number of social, political, and religious problems that were then agitating England. Professor Seeley's valuable book on the "Expansion of England" has helped me to see why the faculty for design died out with us in the eighteenth century, for he shows how entirely English interests were then centred in America and her other colonies. Think of the war-ships that had to be built, the armies to be equipped, the colonies to be fought for and occupied, and, later on, think of the machine-looms and steam-engines to be invented and perfected, and the railways to be made! How naturally does the engineer spring into existence amid the demand for the useful arts! How naturally does the eye of the historian pass on to the record of that noble set of engineers, mechanists, and mathematicians—Davy, Watt, Cavendish, Arkwright, Herschell, Stephenson, and Brunell! And how natural that the men of genius should gravitate—not to the ornamental arts as in earlier days, but to the useful arts! Yes, one may well say that English science had produced a perfect vacuum long before the scientific investigator had discovered the way for himself, and that in an unsuspected direction.

And now, having considered the origin of the engineer, who is one of the cuckoo intruders in the architect's nest, let us turn to the origin of that still bigger bird—the ornamentalist or expert in the decorative arts. I said just now that the Gothic revival had inaugurated the change from the old system of architectural practice to the new.

Before this revolution of taste took place the architect was the leading spirit of the building he designed, but he did not stand alone. His designs or models for stone, brick, iron, wood, and plaster work were backed by the traditional skill, and

types, and methods of craftsmen, each of whom was more or less of an artist. The architect was only the prime minister: the workmen represented the departments. He was only the president for the time being of a little republic of art. From what we know of Wren, Inigo Jones, and the Chambers and Adams, the architect was conversant with every branch of the work included in the structure. He supplied the plans and sketch-elevations, and the leading details (as in John Thorpe's case), but the hundred and one odd details required for after-thoughts and emergencies might fall to the conduct of the workman, who, at all events, would be quite competent to deal with them, if so required. Here, then, we have architecture carried out under the best auspices—where architect and workmen are in perfect sympathy in matters of taste, where the designer has a fellow worker in the handicraftsman, where one craft helps and overlaps the other, the executive and the theoretical go hand in hand like twin sisters, the structural and the ornamental proceed along the same lines, and we have building which deserves the name of architecture.

The Gothic revival upsets all this harmony of procedure, for the whole of the traditions of the past must be sacrificed, and new types, mouldings, traceries, carvings, groinings, decorations, and the rest of it are introduced, about which the workman knows nothing and cares less. From henceforth you must look no more to the English workshops for the inception of types and evolution of ideas. The old *Téméraire* of English art having been sent to her last home, a bright new Venetian gondola takes her place, and rides proudly out to sea with seven Gothic lamps at her prow, an Oxford graduate and a few able enthusiasts to work the oar, fire off the guns, and take care of the cargo of sketch-books and romantic literature on board. Naturally the gondola is first attracted to Venice, but as time goes on the taste of the crew changes, and you find them flying about in all directions, and bringing home valuable spoils in the shape of numberless new sorts of doors and windows to offer at the feet of a grateful people. And the merit of the new types consist in this, that they are quite unique in England, and that the British workman cannot move a step, as he copies them, without full-sized details of every part.

Now my explanation of the origin of the specialist decorative artist is this. Having destroyed the old system of art, the Gothic revivalist found himself unable to construct a new system that would work; he had accepted a task which he was unable to cope with. He had a strong love of art, a true sense of the intimate relations of the lesser arts with architecture; but he found things too much for him, and, instead of raising an army of fellow-labourers in the workshops, he called into existence certain specialist assistants to aid him in the conduct of his practice, where he lacked time or ability to carry out the work himself. The mischief of the whole business has been that he was only a learner himself all the time he was carrying out works in various styles. He has been only a blind man leading the blind. He was up a tree all the time himself, and the specialist has been found an indispensable help in supplying his necessities.

I come now to my third point. Is it possible for architecture under its present conditions to be carried out upon the old lines, and if so, by what means? To the first division of this point my short answer is—No and Yes. No, if the present conditions are to remain unchanged. Yes, if things change for the better. In dealing with the whole matter before us I do not want to arraign modern art for difficulties inherent to it, nor do I want to multiply the responsibilities of the architect. That some of the higher branches of an architect's work have been abandoned is undeniable; and I plead for the recovery of these at any cost. In claiming this I do not desire to extend the radius of the architect's proper work. I am even arguing for the lessening of his labours by bringing the handicraftsman into a more active participation in the work he has to do. This was the old system, and it is the only practical solution of the case.

The question is, to what extent our present difficulties are inevitable or irremediable. I have no hesitation in putting at the head and front of our difficulties this of having to employ revived styles. Any suggestion that you or I can make which will indicate some way of mitigating our sufferings in this matter will therefore be a boon. We are in for the use of all the various phases of the various periods of architecture, extending from the thirteenth to the eighteenth centuries, in England and abroad; and when it is remembered that the giants of the past had all their work cut out to master the capacities of one style only, the vastness of our task is appalling. Every post brings us in a request from this quarter or from that for details of buildings which may each be of a different style. Add to this that one must keep touch with the progressive science of the day, and must be able to speak authoritatively of all the rival "sanitary specialities" and rival ventilation and warming schemes and electric lights, and hygienic rock and asbestos and American joinery, and the scores of dodges for minimising art in the workshop, and girders and lifts, and "Acme" or "Imperial" this, and "Eclipse" or "Last for ever" the other—to say nothing of having to pronounce offhand upon Metropolitan Building Acts and having to wade through surveyors' quantities and builders' accounts—is it any wonder if the architect gets so tired out with the business side of his work that he gladly leaves

the problem of art-production and ornament to the specialist decorator and manufacturer?

You will observe, too, that at conferences and in presidential addresses and that sort of thing, where it is necessary to speak cheerily and respect the feelings of the profession at the same time, the architect has invariably only one sovereign remedy to suggest—one patent salve is to heal all our disorders—and that is the specialist. The specialist, either inside or outside of the profession, is to ease everybody and everything all round! The proposal is that there shall be a sort of inner circle of the profession. The profession is to keep a paddock for the prize animals, who are to be warranted to have only one gift each, and who are to run round the paddock in a given groove all their lives. And all the sectionally-gifted persons are to make up one entire concrete architect, on the principle of making a quilt if you have enough patches to cover it.

I grant you that, according to the present state of things, specialists must exist to do such things as these—to superintend the imitation of old work; to carry out decoration in a given style, Pompeian, Egyptian, Classic, or Gothic; to restore or build Gothic or Classic churches; Elizabethan, Jacobean, or Georgian houses, and the like. The question, however, arises here—Are we to go on imitating the styles of the past? Specialists are necessary if we do go on in our present courses; but if we are to get out of the mists and on to the hill-tops again, we must train ourselves for our future liberty. If we want to perpetuate chaos and will-o'-the-wisp art, I do not know that we can devise a better means to that end than the establishment of representatives of the rival styles and rival trickeries of the day. But surely we do not want practitioners of one accomplishment or one idea! Surely we do not want to ruin and degrade the noble art of architectural design by introducing into it that miserable division-of-labour system which (as Mr. Morris points out) has in the case of our manufacturers reduced the workman to a machine, effaced his individuality, taken away all the pleasure of labour, and destroyed the standard of excellence. The making of architectural design deserves a better system of procedure than the manufacture of a modern pin! Let us, then, listen—no, not for a moment—to the bewitching suggestions on this head! The disorder of modern architecture is too deep-rooted to be remedied by the quackery of a specialist. We will not allow the great factory and machine system introduced in the great art that has fallen to the care of our unworthy hands. Let us rather take courage and look forward to the time when the jumble of styles will be cleared away or reduced to system, and prepare ourselves for an all-round practice in our vernacular that is to be. Depend upon it that it will not be the one-eyed, or one-legged, or one-armed, or one-idea'd specialist practitioner that will then be sought for, but it will be the architect with the most individuality, the most culture, the most skill, the most efficient training, that will be sought for, and found most useful to the architect of the future.

But you may well now remind me of my promised suggestion of the means I would propose to bring about the redemption of the old ideals of our art. First, I would say, let architects determine at all costs to recover lost ground. Secondly, let architects endeavour to render the types now in vogue more malleable for nineteenth-century use in our workshops by classification or otherwise, by which means new traditions may be established, and the standard of excellence raised to something of its old pitch. In regard to the first point, some of us have grown too old in naughty slothful ways to hope ever to accomplish much in the personal manipulation of the handicrafts, but we are none of us too old to determine, God willing, that our younger brethren shall have better chances than we had at their age, better chances for modelling and drawing ornament, and for taking their share in the design of house-fittings and the like. None of us, moreover, are too old to help to dignify the labour of the workman whose dusty clothes soil the best Sunday-go-to-meeting coats of the members of the Royal Institute of British Architects, as they accidentally come in contact with him in the builder's yard. We are none of us too old to help to establish new traditions for the workshop, by classification of types and features done in such a way that they may appeal to the workmen in a more practical, familiar, and lovable way than they do now.

May I divert your interest for one moment from that all-important matter, the modern architect and his art, and ask you to look at the British workman. What is his condition? What are the issues of his life's work? What have you done for him? We left him in the eighteenth century, a magnate according to his personal qualifications in his little parliament of art, the workshop, evolving architectural types, and putting his whole soul into his work. In those days he was an intelligent being, following his craft joyfully because he excelled in it, and knew what he was about, and had a felt-place in the world. You have scattered those workmen, you have dissolved these little republics of art that in old days held sway in every town and village in the land, and what have you put in their place? You have drowned the English handicrafts by opening up the sluices of a ceaseless tide of archaic types, and how has your eclecticism affected the British workman? Certainly you have with a vengeance directed his eyes to the wonders of old art, and have given the charm

of novelty to his every-day occupation; you have introduced him to a very Pandemonium of tit-bit types; you have shown him how various have been the doors and windows in the buildings of past days; you have muddled his ideas and confused his brain, but you have done nothing to form his taste or settle his standards; you have added not one single pet moulding to his tool-chest, nor helped him to pigeon-hole a single familiar feature; he has no lasting impression of any piece of work you ever gave him to do. Had he had the origination of the changeful types that have passed before his eyes instead of *you*, he might have retained the same vague sense of things that you have yourself; but, as it is, his memory is no more fixed about the patterns he has worked than the loom which turns out patterns mechanically. He is in for the deluge, and no soft dove comes to whisper hope in his ear. He is the slave of caprice, the plaything of fickle humours, the sport of mutable tastes and veering winds of fashion. What a long dreary jest his life has been, and how, in his sober moments, he must sigh for the blessed, irredeemably bad art of the bad days before the deluge! Yet, in this much-abused, much-misunderstood, much-enduring, unheroic, untrustworthy, misbelieving, self-seeking, wife-beating, drunken, conceited, shallow, *Daily-Telegraph*-reading, school-of-art trained man, behold the martyr of the nineteenth century. The Gothic revival proved the winding-sheet of his peace of mind, and one thinks that it had been better for his mental, his social, his moral and religious state, had the modern Gothic architect never been born! Nay, we of the Architectural Association would almost have preferred that he had been left daubing stucco-walls and chasing those curly ornaments and smiling cherubs on tomb-stones, and making those moulded Jacobean pews that we find so fascinating when we go to study Gothic architecture in some tip-top Mediæval church!

Just think of all the sad, bad, and mad architecture that has passed under the British workman's hand, say in these last thirty-five years. In 1850 he was rearing a Norman apse upon the ruins of an old chancel that had been destroyed in the interests of morality and purism. In 1855 he was building a thirteenth-century hotel with details cribbed from Salisbury Cathedral, and a bank adjoining it in the Ducal Palace style. This took him some time. In 1870 we find him titivating an old Queen Anne house in a Gothic manner; and in 1880 he was titivating an old Gothic house in the Anglo-Foreign "Early English" Queen Anne manner; and now, in this year of the architect's salvation, he is satisfactorily completing the memorial of the nineteenth century at the west end of St. Albans Abbey, under the reputed direction of our all-accomplished, soft-handed, "emancipated," and only truly British architect, Sir Edmund Becket, Q.C.

Now I want to know if we cannot do something to regenerate the art of the builder's yard and to raise the workman's position; and, if no higher motive affects you, think how it is for the interests of the modern architect and his art that you look steadily into this matter and do your best in it. I am firmly persuaded that there will be no good architectural design and no good execution until the craftsman can be brought to participate with the architect in the working out of architectural ornamentation. It is just one of those things about art which marks its divine origin and inherent dignity. You can get faultless mechanical work out of machines, and you can get good mechanical work out of human machines, but noble hand-labour is only found where the workman uses his intelligence, and where he is able to express the individuality of the individual. I would say, then, begin the work of regeneration by throwing away all your petty professionalism. Give the workman his rightful participation in your aims. Let him see into your great mind. Make him something more than the transcriber of your hesitating lines. Lift him nearer to your own level of knowledge so that he may know something of the essential qualities of the style he is working in, and may at least interpret your thought sympathetically, render in his own idiom the things you put before him, and find some way of escape for the soul within him. Thus, and thus only, will you get good architecture and good sympathetic workmanship. Thus, and thus only, will you effectually and fairly lift some of the crushing load of responsibility and labour from your own shoulders, and get the help-meets God made for you. The old architect lived long and saw good days because he was thus helped. But Pugin, Scott, Street, and Burges died young, and you know that the doctors say it is worry and not work that kills. This single-handed system of architectural design, where every detail must be supplied from the office, was too much for them. More than this. They were men of singular love of good workmanship, and nothing worried them more than to see their work carried out unsympathetically, or to find their designs carried out to a wrong scale, or their mouldings worked from the wrong side of the sectional line!

I conclude this paper with two propositions which aim at the amelioration of some of the evils I have here enlarged upon. The first is as to the selection and classification of the architectural types now in vogue. The second relates to the provision of technical education for architects and craftsmen. With regard to the first point, it is clear that no scheme of architectural design has ever been practised without a basis of workshop traditions. Shall we then—is it worth while to try and formulate our tentative styles and to systematise our distracted types, with a view to rendering

things permanent and to assist the workmen? If so, you must have a grammar and an alphabet before you can form words and sentences. Now it so happens that never since the world began has so much architectural knowledge been accumulated as is now stored up in the brains and on the shelves of the English architect. Why, then, should not these experts be set to work to formulate and render into serviceable shape the leading mouldings and forms and features of the styles in vogue? Why should not the destroyers of old English traditions do penance and make reparation for their naughty deeds, and build up new traditions? Why should we not have a well-arranged series of details of arches, capitals, bases, plinths, friezes, cornices, staircases, doors, windows, &c., for workshop use?

The second proposition is to have a technical college for the instruction of architectural design, to be for the use of architects and craftsmen. If modern architecture showed itself in as attractive form to the public as English music does, the scheme would receive the attention which we who know our pitiful state think that it deserves. One thinks that if the scheme were started under proper auspices it could not fail to receive the support of the Royal Academy, of the Institute of Architects, of the Architectural Association, and of all other public bodies who have any care for the advancement of the various arts and sciences connected with architecture. If such a college were set on foot one might feel perfectly secure about the architecture of the future, for it might be expected to bring about that harmonious cultivation of the crafts without which the practice of architecture is a delusion and a snare. Depend upon it the hope of English architecture must come from the workshop, and not from the architect's office. Cast aside, then, as unworthy and profitless, the notion of specialists within or without the profession, and this for your own sake, your art's sake, and the sake of the art of the future. Cast aside also the notion that the mere personal taste, learning, theoretical knowledge, or power of penmanship of the architect will avail anything for the real advancement of art, unless the craftsman who works out his ideas reflects his accomplishments and can sympathise with his aims.

What we want is not so much men who can design in many styles of more or less remote antiquity, or men who can sketch well, but men of aim who can lead the aimless, men who by their personal acquaintance with the handicrafts and personal participation in the production of ornamental art can build up new traditions for the workshop, restore the credit of English workmanship, and recover the lost ideal of the English architect.

The PRESIDENT said Mr. Sedding had put his subject to them in a very interesting and amusing style. Referring to the spirit of attack and slaughter that characterised the paper, the President said he had waited in hopes of hearing a remedy defined for the evils. Mr. Sedding seemed to have but a feeble opinion of the Association, and but a poor idea of its work. They had come apparently to this, according to Mr. Sedding, that the Gothic revival had been an absolute failure. The President's opinion, however, had always been that we had had architects who had created works of beauty, buildings which were sources of pleasure and subjects for study, which would always be able to hold their own, and which thoroughly fulfilled all the purposes required of them. They would all agree with Mr. Sedding in his remarks as to the relations of the architect with the workman. He believed there were architects, and Mr. Sedding one of them, who had trained their workmen to take pleasure and pride in their work—workmen one ought to stand hat in hand to, and learn all one could from.

Mr. GOTCH proposed a vote of thanks to Mr. Sedding, who, he said, had drawn such a gloomy picture in so pleasing and lively a way. Mr. Gotch said he disagreed with the President about the paper. He thought nothing could be better than to have a person in Mr. Sedding's position to come and give them cut and thrust all round, for contentment was the bane of life—he meant to say the bar to all progress—while a feeling of judicious discontent had led to all the improvements achieved. The idea of educating the workman was good, only he did not see how it could be done. It presupposed an intimate relation with the workman; but the fact was, if you gave him a moulding to work, he sent it to be run off by machinery by the mile. The modern system of procedure was at fault, and not the architect. If there were only a score of enormously rich clients who would give *carte blanche* to architects, something might be done. The system of contract, cutting down all in the shape of extras to what was barely necessary, was a serious obstacle to architecture. Mr. Gotch said he did not think specialists were the modern production so generally imagined. Men who had come down to us as architects, William of Wykeham and others, were not architects at all. He did not think they drew or designed, except perhaps some details, but set the master mason to work instead. There were not so many styles, either, in past times. Forms of mouldings, cornices, &c., had grown up gradually, and, being ready to hand, were used all over the land, but they could not fall back on that. The present condition of things must be tackled, and in the specialists he hailed Mr. Sedding's workmen, men to whom he was ready to take off his hat. We had an exaggerated idea of the old work, old furniture, &c. But it was only good work which had lived to our time.

So also a hundred years hence all this shoddy would have disappeared, our great buildings would remain, and the work of our century—the latter part, at any rate—would not be so despicable as people would have us think.

Mr. W. HILTON NASH seconded the vote of thanks. The church on the Isle of Purbeck, he said, was built of the finest stone—Purbeck stone. Time and cost for the building were not limited, and the workmen were told to put up the very best building they could. Every detail showed that they had used their utmost skill, and the church would be a lasting memorial of good work. Every man must have been ennobled by working on the building. Mr. Sedding had made out architects to be chameleons. They were red in Queen Anne style, and they became white in Gothic. However unsatisfactory, it was a condition of an age of much change, and they must make the best they could of it. Still there were many noble buildings in London. Only to mention two, there was the Reform Club, and the offices of the British and Foreign Bible Society, one of the noblest buildings London had ever produced. Mr. Sedding cited the names of Mr. Butterfield, the late Mr. Burges, and Street. These gentlemen have exercised much influence on workmen. One thing not to be lost sight of was to study no portion of a building except in its relation to the whole. Want of knowledge of sanitary matters was one thing that brought disrepute on architects, and if a specialist were called in for ever so small a matter, he would edge his way in altogether.

Mr. J. M. MACLAREN advocated some development of the arrangements in technical education and in schools of art to enable architects, artists, and workmen to work side by side. The result of this diffusion of knowledge would hinder an architect from carrying out fads of his own, as they would be seen through. The public would also get better educated in these matters.

After some remarks from Mr. H. D. APPLETON, hon. secretary, and other members, the vote was put by the President and carried by acclamation.

Mr. SEDDING, in replying, said that during twenty years he had stuck to one builder, a Cornishman, who had restored he supposed at least a score of churches for him in Devon, Bedfordshire, South Wales, London, &c., and this showed how long the question of sympathy between architect and workman had been brewing in his mind. Speaking of the advantage of having workmen who understood the work he wished them to do, he said they had all now, he was sorry to say, gone off elsewhere for higher wages. Mr. Appleton had asked whether he thought workmen would derive advantage by attending at the Architectural Association, and he should say yes.

#### MR. RUSKIN'S LECTURES.

THE fourth of the lectures on "The Pleasures of England" was given by Mr. Ruskin in the lecture theatre of the University Museum, Oxford, on Saturday afternoon, the subject being "Cœur de Lion to Elizabeth: the Pleasures of Fancy." The Slade Professor began by remarking that accidentally in the course of the preceding lecture they would remember he had given them what was, in his opinion, extremely good advice, namely, never to make a shot at anything either by word or fancy. He was the better qualified to give them that sage advice, because he was at the moment he did so making a shot himself at the name of the Venetian Doge. He thought at the time he knew it, but he found afterwards he had given them the wrong name. The proper name of the Doge he had referred to was Domenico Selos. He must ask to be allowed to read some more about him from the third chapter of a little book of his own, called "The Divine Right of St. Mark's Rest," a book which was originally intended to be read aloud, because there were many passages in it which required to be accented. The book would be placed in the school, and what he could not read to them they must look up for themselves. Mr. Ruskin quoted extensively from the volume in question, commenting by the way on the fact that the Venetians in those days were always armed; even when they went on the most pious missions they were always ready for what might turn up. Referring to the violet, the Professor reminded his audience that a long time ago he had told them that while at the home of the violet, and gathering it at Palermo, he had matched it against the violet-coloured sea, and did not know the one from the other. He here showed two water-colour drawings, one of the sea and another of the flower, to convey his meaning, remarking that the first time he saw what a Greek sea meant he saw what Homer's "violet-coloured sea" meant. He also showed a picture of three female saints in the dress of the sixth century, everything pleasing, with jewels and diamonds all round. Indeed the gorgeousness was a scene which we could not believe now, far less imagine. In "Modern Painters" he had distinguished, unnecessarily, between fancy and imagination. Dean Stanley's word "phantasy" was accurate for both, only it was somewhat of lighter affairs when we said it was fancy, and when we quitted that to call it a sense of imagination. When a boy fell foolishly in love with a girl it was said he had taken a fancy to her. If he loved her rightly—that

was to say, for her noble qualities—we ought to say he had taken an imagination to her; because then he was endowed with the new light of love which saw and told of the mind in her; but not falsely or vainly, as Wordsworth said, most unkindly and most conceitedly, of his wife:—

Were such as thou in all men's view  
An universal show,  
What would my fancy have to do,  
My feelings to bestow?

But the fact was that the poet's wife was only there simply that she might be an object from which he might draw the details of the drapery he was fancying. But a true lover's love did not bestow; it discovered what was, indeed, most precious in his mistress and wrought most deeply for his life and happiness. Day by day as he loved her better he discerned her more truly; and it was only true of her love which thus forced him to her that it could at once disenchant him and blind him; and the association of this truth in living conception of the true character was conclusively shown in the feelings which were recognised as first reaching their height in the days of chivalry. One could look at a girl until he believed her an angel, because at her best she was one; but he could not look at a cockchafer until he believed it was a girl. The Professor produced a beautiful picture of the *Virgin and Child*, with an armoured soldier standing on her right and a monk on her left. He explained this to be a copy of one of the grandest pictures in the world. After referring to several of the female mythical saints, Mr. Ruskin said it would delay them too long to dwell further on that subject; but they would find plenty in "*Fors Clavigera*." He then went on to quote from Carlyle's "*Life of Frederick the Great*," with which the lecture concluded. The subject of the next lecture will be "*Protestantism: the Pleasures of Truth*."

## THE CITY COMPANIES.

### 1. The Masons' Company.

NEARLY the whole of the records of the Worshipful Company of Masons prior to the year 1666 appear to have been destroyed when the hall of the company was burned in the Fire of London. The only documents in existence of an earlier date are the grant of arms, dated the 12th Edward IV., by which Clarencieux granted to the Craft and Fellowship of Masons a coat-of-arms, which is the same as now used by the company, and a volume of accounts, the earliest of which is dated 1620, being the accounts of the "Master and Wardens of the Company of Free Masons within the City of London." In the heading of the accounts the company is so styled until the year 1655-56, from which date to the present time the accounts are headed as the accounts of "The Master and Wardens of the Worshipful Company of Masons of the City of London." The earliest charter now in their possession is the 29th Charles II., A.D. 1677, granted on a petition by the master, wardens, and assistants of the Company of Masons in London, but there is nothing to show whether or not any earlier charter had been granted to them.

The company have the charter of the 29th Charles II. above mentioned, and a charter of the second year of James II., which commences by reciting that the master, wardens, assistants, and commonalty of the company had surrendered all their powers. The charter of Charles II. was afterwards inspected and approved in the first year of the reign of Queen Anne. By the charter of 29th Charles II., after reciting that "by an Act of the 5th Queen Elizabeth the art or occupation of a mason is reckoned as a distinct art or occupation, and that all persons exercising the said art were enabled and might be compelled to take apprentices to be instructed in the occupation," and reciting that the master, wardens, and assistants of the Company of Masons had prayed that the king would by letters patent incorporate them a body politic, to have perpetual succession, and to grant them such privileges as should seem requisite, and that the king willing and intending the support and continuance of the company, and the improvement of the art and mystery of masons, and to the end that they might be empowered to suppress and reform all abuses practised by persons who took upon them, without sufficient skill and knowledge, to work at a mason's trade, and that the art and mystery of masons within the City of London might from thenceforth be artificially and truly exercised, His Majesty ordained and granted that all and singular masons, freemen of the City of London, and all other subjects that should thereafter use the art in London or Westminster, or within seven miles' compass of the same on either side, should be one body incorporated politic by the name of "Master Wardens, Assistants, and Commonalty of the Art and Mystery of Masons of the City of London," and by the now-stating charter His Majesty did constitute and declare them to be one body corporate, so that they and their successors should have perpetual succession with power to hold lands notwithstanding the statute of mortmain, and that the company should have a common seal. The charter further ordained that there should be one master, two wardens, and twenty-four or more assistants of the company, with power to make and alter from time to time laws, ordinances, and constitutions which to them or any eight of

them should seem necessary or expedient touching or concerning the improvement or trade of the mystery of masons, and the order, rule, and good government of the company, and for defraying the public and necessary charge of the company and corporation. The charter provided that the election of master and wardens should take place annually on June 14, that the assistants should be chosen for life unless removed for evil government or misbehaviour or other lawful or reasonable cause; and the charter granted power to the master, wardens, assistants, and commonalty of the company in lawful manner at all convenient times at any place within seven miles of the City of London or Westminster, where any stones to be used in the art or trade of masonry should be brought or laid, to search and see whether the same be of proper length and measure, and whether the same be well and sufficiently wrought, and if any should be found and adjudged to be illwrought and not amended at the charges of the owner before the same should be put to sell, or that any of them which should be so faulty that they cannot be made good, then they should be disposed of according to law, and that the company should have power to depute any fit persons to make and execute such views and searches. The charter further ordained that no person should exercise the art or mystery of a mason, unless he served seven years' apprenticeship to a freeman of the company, or to some other person lawfully exercising the art. The charter provided that nothing in it should be considered to extend to the prejudice, obstruction, or hindrance of the erecting, building, and finishing of the cathedral church of St. Paul in the City of London, or any other church in the same city, which was formerly burnt down by the late dreadful fire which happened in London. The charter further provided that the master, wardens, and assistants of the company, and all other persons admitted into or employed by the company, should before execution of their offices take the oaths of allegiance and supremacy. The charter of February 9 in the second year of King James, after reciting that the master, wardens and commonalty of the Company of Masons had surrendered all their powers, franchise, privileges, and authorities of or concerning the electing, nominating, constituting, being or appointing of any persons into the several offices of master, wardens, assistants, and clerk, which surrender His Majesty had accepted: The charter constituted, declared, and granted that all and singular masons freemen of our said City of London, and all other subjects that then did or thereafter should use the same trade within the cities of London and Westminster, or seven miles' compass of the same, and all other persons that then were or should thereafter be free of the company, should be one body incorporate politic, by the name of master, wardens, or commonalty of the art or mystery of the masons of the City of London, and the charter ordained and constituted them one body corporate and politic accordingly. The charter granted to the same company power to hold any manor, lands, tenements, liberties, jurisdictions, franchise, rents, reversions, privileges, and other hereditaments in fee and perpetuity or for years, the statute of mortmain or any other statute notwithstanding, and the same lands to sell again, lease, and grant, and to sue and be sued as a corporate body, with similar directions as to the officers of the company to those contained in the charter granted by Charles II.

By the charter, the company are authorised at any place within seven miles of the City of London or Westminster, where any stones to be used in the art or trade of masonry should be brought or laid, to search and see whether the same be of proper length and measure, and whether the same be well and sufficiently wrought, and if any shall be found and adjudged to be ill-wrought, and not amended at the charges of the owner before the same be put to sell, and that any of them that are so faulty that they cannot be amended and made good in size, thickness, and goodness, the same should be then disposed of according to law, and the company was to be at liberty to appoint deputies or agents to make such searches.

The by-laws provide the mode of carrying out this search, authorise the appointment of deputies for the purpose, direct that no person of the company shall buy any stone to use or to sell again until the same has been viewed, and that the company shall have for their pains in viewing and searching 4d. per 100 of Purbeck stone, and 4d. per ton of other stone. It also provides that if His Majesty or his successors should have occasion for the masons to erect, build, repair, or finish any structure, fort, tower, castle, or fortification, it should be lawful for the master, wardens, and assistants of the company to provide so many masons, members of the company, as should be from time to time ordered by the master mason of England for the time being.

It appears by the accounts of the company that this privilege of searching stone was exercised for several years. No entry appears in the accounts of the company of any receipts from this source in this century, and the right has not been exercised within the memory of any living member of the company.

The present constitution of the governing body (three having recently died, and no opportunity of filling up their office having yet occurred) of the company is a master, a warden, a renter warden, and seven assistants. This constitution is in accordance with the charter, except that the charter prescribes that there

should be twenty-four assistants. The number has fluctuated from time to time, and, as the charter prescribes that eight members of the Court should be a quorum, the number of assistants has been allowed to diminish.

The only qualification for membership of the governing body of the company is that the person elected should be a freeman and liveryman of the company.

The master, wardens, and Court of assistants of the company have the free, exclusive, and uncontrolled management of the affairs of the company. Each member of the Court of assistants on his election to the Court pays a fine of 5*l.* 7*s.* 6*d.* Each member of the Court of assistants when elected renter warden pays a fine of 4*l.* 7*s.* 6*d.* The upper warden when elected pays a fine of 4*l.* 7*s.* 6*d.*, and the master when elected pays a fine of 4*l.* 7*s.* 6*d.* There is no salary paid to the members of the governing body, but each member receives a fee of 2*l.* 2*s.* at each Court at which he attends.

The master is elected annually, and serves for one year. The upper warden and renter warden are elected annually, and serve one year. They are always members of the Court of assistants. The Court of assistants under the charter are nominated to the office during their natural lives, unless they or any of them shall misbehave themselves in their said offices, or for some other lawful or reasonable cause shall be removed. By a resolution of the Court of assistants passed on the 22nd day of October, 1873, and which has been signed by every person then a member of the Court, and every one since elected, it was resolved that any member of the Court becoming bankrupt, or making any arrangement with his creditors to procure a release from his liabilities, or paying less than 20*s.* in the pound, should cease to be a member of the Court. There are at present members of the company formerly members of the Court of assistants who have resigned their office of assistant, but no member has been removed against his will within the memory of any one now in the company.

The by-laws of the company were made by the master, wardens, and assistants of the company, were approved of by the Lord Mayor and Court of Aldermen and the City of London, and were ratified and approved by the Law Courts in 1678. The by-laws prescribe regulations for admission and register of apprentices, regulations for the search of stone used, brought, or laid in any place within seven miles of the City of London or Westminster, and certain fees for such search, namely, 4*d.* for every 100 of Purbeck stone, and 4*d.* a ton for every other stone. They prescribe the dimensions of paving stone, hard stone, ashler's Purbeck stone, and steps.

It was ordained that all persons using the art or mystery of a mason within the cities of London and Westminster and seven miles compass thereof, then, or thereafter to be made free of and admitted into the company, shall contribute his or their equal sum or proportion of money towards paying or defraying the charges and expenses to be disbursed about the common affairs of the company. The freemen of the company were prohibited from employing any foreigner or journeyman coming out of the country either alien or English not being free of the company unless he be first presented to the master and wardens of the company, and bring a certificate with him of his lawful service, behaviour, and former place of abode.

The members of the company consist of freemen and liverymen: women are not admitted to membership of the company. The qualification for membership of the company is that the applicant shall be a male of full age and a subject of Her Majesty.

The freedom of the company may be obtained:—1. By patrimony, if, at the time of the applicant's birth, his father was free of the company. 2. By servitude, serving an apprenticeship of seven years to a member of the company. 3. By redemption. The fees payable in respect of the admission are 5*l.* 5*s.* by patrimony, 5*l.* 5*s.* by servitude, 7*l.* 7*s.* by redemption.

The charter of 29 Charles II. prescribes that no person shall exercise the art or mystery of a mason within the cities of London or Westminster, or within a compass of seven miles thereof except the freemen of this company. There is no process for compelling such persons to procure admission. The freedom of the City of London is not in any way a condition precedent or subsequent to membership. There are members who are not free of the City of London. A considerable proportion of the members of the company are connected with the building trade, being either architects, engineers, surveyors, builders, masons, or stone merchants. The numbers of persons following these occupations who are now members of the company are twenty-two.

Freemen are not liable to disfranchisement.

The livery of the company is unlimited in number. The qualifications for election to the livery are that the applicant should be free of the company and have taken up his freedom. The electors to the livery are the master wardens and Court of assistants. The fees payable on election to the livery are 15*l.* No liveryman has been removed from the livery after his election thereto within the memory of anyone connected with the company.

The present number of freemen of the company is forty-one. All the freemen are liverymen of the company. There are no other members. The number of admissions to the freedom of the company and calls to the livery which have taken place during the

year 1871 was two, both by redemption. In the year 1872, there were two by redemption, and one by patrimony. In the year 1873, one by redemption. In the year 1874, one by redemption. In the year 1875, two by redemption. In the year 1876, one by redemption. In the year 1877, one by redemption. In the year 1878, none. In the year 1879, one by redemption. In the year 1880, two by redemption. Each person admitted to the freedom of the company during the last ten years has been called to the livery of the company forthwith.

No apprentices have been bound under the auspices of the company during the last ten years.

There are no pecuniary advantages incident to the position of a member of the company as freeman, liveryman, or member of the governing body, except as stated in next paragraph. A freeman of this company is entitled to become a freeman of the City of London. There are no other advantages.

The sum paid on an average annually for the last ten years by the company to the master of the company has been a fee of two guineas for his attendance at each Court, averaging 12*l.* 12*s.* per annum. To each warden a fee of two guineas for attending each Court, averaging 12*l.* 12*s.* per annum. To each renter warden a fee of 2*l.* 2*s.* for attending each Court, averaging 12*l.* 12*s.* per annum. There are at this date only ten members of the Court of assistants, including master and wardens, but there are usually twelve. Each member attending the Court punctually is entitled to a fee of 2*l.* 2*s.* The average amount paid to the members of the Court annually during the last ten years, including the amount paid to the master and wardens, has been 115*l.* The amount paid annually in pensions to persons, members of the company, during the last ten years has averaged the sum of 132*l.* 3*s.* 6*d.*

There are no other payments to any member of the company. The circumstances which in practice are held to constitute a claim to a pension or donation from the funds of the company are that the applicant should himself have been a freeman of the company, or if a woman, that her husband or father should have been free. The number of pensioners at present receiving annually pensions from the company are nine. The pensions paid are one of 25*l.*, one of 20*l.*, two of 15*l.*, and five of 10*l.* All but one of the pensioners are connected with the trade of masons or the architect's profession.

The average standing of a member of the company when he becomes a member of the governing body is from eight to ten years. Any member elected to the Court of assistants continues a member for the remainder of his life. The two last senior members of the Court who have died in office had been members of the company for over fifty years and over sixty years respectively. The company does not carry on any trade or manufacture.

#### GLASGOW ARCHITECTURAL ASSOCIATION.

THE annual monthly meeting was held in the rooms on Tuesday night, the Vice-President in the chair, when Mr. James Brough, decorator, read a paper on "Ornamental Forms in Nature." Confining the portion of nature studied to the vegetable kingdom, the essayist reviewed in order the Egyptian and Greek styles of ornament to prove how each, though in widely different ways, took nature as their model, but only in principles carefully deduced, and never by attempted mere copying—an art simply imitative requiring little more than patience for its accomplishment. The laws regulating true conventionalism, and also those—more specially seen in plant life—which apply to the form and direction of curves, were considered; in all cases abstract form rather than colour being studied. The paper was illustrated by a large number of botanical diagrams, studies of plants and decorative applications of the same, all the work of the essayist. A portfolio of Owen Jones's designs for wall decorations, and also one of present-day manufacture were exhibited to show the increased freedom with which designers now utilise natural forms. A vote of thanks to Mr. Brough terminated the meeting.

#### THE GWALIOR GATEWAY.

THE final consignment of the carved stonework of the gateway presented to the South Kensington Museum by His Highness the Maharajah Scindiah has recently arrived in London; but owing to the great size and weight of the pieces of masonry it has been found impossible to assign a suitable place to it in any part of the present buildings. The Indian collections being located in the galleries of the Royal Horticultural Gardens until the completion of the western wing of the South Kensington Museum, no site can be found on which the gateway can be incorporated with the permanent buildings. As it would be a regrettable circumstance if, for this reason, this magnificent gift could not be exhibited to the public for some years, we are glad to learn that it has been proposed that the authorities of the museum should be requested to allow this imposing example of Indian art workmanship to be lent to the Commissioners for the great Indian and Colonial Exhibition which is to be held in London in 1886, in the grounds of which there would be space to erect it. The place of honour would be assigned to it in the Indian Department, and the Maharajah's gift would attract a wide notice, and doubtless be duly appreciated.

CHAPTER HOUSE, SOUTH AISLE OF CHOIR, &c.

## ILLUSTRATIONS.

LEWINS, KENT.

BEGUN a few years ago and recently completed, this mansion-house stands on the slope of Crockham Hill, near the little village of the same name, and commands most extensive views southwards over Kent and Sussex, the site being almost unequalled in this respect. It is built of red brick, relieved here and there with weather-tiling and half-timber work. The window-mullions and dressings on the ground-floor are of Howley Park, a Yorkshire stone of a soft greenish-grey colour, and the roofs are covered with dark brown local tiles.

The stables and home-farm are about a couple of hundred yards to the north of the house, arranged round two courtyards, and form a picturesque group of buildings in harmony with the style of the house.

The contractor for the whole of the works was Mr. DURTNELL, of Brasted, Kent; and the architect, Mr. J. M. BRYDON, of 5 Cambridge Place, Regent's Park.

LADYWELL, ORPINGTON.

WE give a view of a residence called Ladywell, which has been erected at Orpington, in Kent. As the land was of a flat character, the architect raised the building on a terrace, and placed the steps between the outer and inner halls. The rooms on ground floor are dining, drawing, and morning rooms, library and billiard-room (30 feet long). From the water tower extensive views of the charming country are obtained. In the grounds, which are about  $7\frac{1}{2}$  acres in extent, are the stabling, greenhouses, and forcing-houses. A lodge is placed at the entrance from the road. The architect is Mr. BANISTER FLETCHER.

FINSBURY CHAMBERS, FINSBURY PAVEMENT, LONDON, E.C.

THESE premises are now in course of erection at the corner of Cross Street by the Finsbury Estates Company, Limited. The substructure of the former building on this site consisted of massive walls and arches, forming a portion of the vaults built over a large area of Finsbury Fields by Messrs. WHITBREAD & Co. about the year 1715. The basement of the new premises will have an almost uninterrupted area of 12,700 feet superficial, and will again be occupied by Messrs. A. PROBYN & Co., ale and beer merchants, who will also have some portion of the ground floor for offices, bottling stores, stabling, &c. On the ground floor, and facing towards Finsbury Pavement, there will be three shops, constructed fireproof, and the corner shop having a frontage to Cross Street, with show-rooms, &c. In Finsbury Pavement also will be the entrance to the suites of offices which it is proposed to form on the first, second, and third floors. This entrance, through an ornamental stone and granite doorway, leads up to the wide stone staircase to first floor, which on this floor is surrounded by an open arcading. The staircase to second and third floors will be of stone, and 7 feet in width, and lighted by a large lantern light. There is a demand for offices in this locality. It is believed that these suites will readily let at the moderate rents at which they will be offered. The fronts of the building to be faced with best white Suffolk bricks, relieved with Portland and Corsehill stone dressings and granite pilasters.

The contractor is Mr. W. DOWNS, Hampton Street, Walworth, S.E., whose tender, 14,967*l.*, was accepted. The works are being carried out from the designs and under the supervision of Mr. J. W. BROOKER, Architect, 13 Railway Approach, London Bridge, S.C.

ILLUSTRATIONS OF MANCHESTER CATHEDRAL.

THE two views on this plate are reproductions of drawings by Mr. T. LOCKE WORTHINGTON, and correspond with those appearing in his book on Manchester Cathedral, lately published. The following extracts describe the subjects:—

The chantry of St. John the Baptist, commonly known as the Derby Chapel, was founded by Sir James Stanley, fourth Warden and Bishop of Ely, and built by John Stanley between 1513 and 1515. We are told in the MS. History of the Wardens that "at Manchester he builded a most sumptuous chapell on the north side of the church, being 28 yards long and 9 yards broad, and a square chapell on the north side of that again he built." It extends the whole length of the choir, being divided from the same by a series of five arches, which were built by Sir John Stanley, the

founder's son, who removed the windows erected by Warden Huntingdon in the north aisle. It is interesting to note that the mouldings of this arcade are of later character than those of the choir. The capitals of the piers are semi-octagonal, and not round, as in the earlier work. The entrance to the chapel is from the westernmost bay, through the beautiful screen-work which fills each archway. These screens, constructed of native oak, between 1506 and 1516, though not so well executed as that on the north side of the library, are elaborately ornamented and elegantly constructed. The tracery contains three designs, many panels having, however, been very poorly restored from time to time.

The entrance to the chapter-house is from the middle bay of the south choir aisle. The octagonal plan of this structure is generally attributed to Bishop Stanley, and Huntingdon is supposed to have previously erected a rectangular vestry. Facts, however, appear to bear out the statement that Huntingdon erected a detached octagonal chapter-house on the site of the existing structure. It was in 1846 that the exterior was designed by Mr. Holden, the work being executed with Horwich stone from the neighbourhood of Bolton. The interior was restored in 1866-68, when an oak vaulted roof was constructed instead of the old flat roof ceiled with plaster. It is lighted by four windows of four lights each, somewhat similar to those in the clerestory of choir. The walls are panelled in oak up to the sills of the windows. Each panel contains rich tracery, and the whole is finished by a battlemented cornice.

## ROSSETTI'S "VENUS VERTICORDIA."

THE oil paintings, water-colour drawings, and engravings which belonged to the late Mr. John Mitchell, of Manchester, were offered for sale on Tuesday by Messrs. Capes, Dunn & Pilcher. The collection included the *Venus Verticordia* of Dante Gabriel Rossetti. The disposal of this great work has excited a good deal of interest, and a proposal has been made that it should be secured for the permanent Art Gallery of Manchester. The point of the sale was of course the putting up of this picture. It was described in the catalogue as a "Half-length nude figure of a female, with long auburn hair, holding an apple on which a butterfly has alighted in her left hand, and a dart to which clings another butterfly in her right, surrounded by roses and honeysuckle." The auctioneer quoted a passage from Mr. Ruskin on the importance of Mr. Rossetti's work, and echoed the hope that the picture would remain in Manchester. He was instructed, he said, to put up the picture at 1,000*l.* After five minutes of waiting there was no offer made of any sort, and the picture was withdrawn. A small water-colour drawing by Mr. Rossetti, *Brimful*, was sold for 105*l.*

## THE EXPLORATIONS AT OLYMPIA.

THE first lecture of an extra course on "The Arts of Greece" was delivered by Professor Baldwin Brown, in the Class of Fine Art, University of Edinburgh, on Monday. Commencing with an account of the German explorations at Olympia, the Professor said the results of that undertaking had been, in the first place, the discovery of works of sculpture belonging to almost every period in the annals of Hellenic art. The very earliest times were represented by several thousand small bronzes, which showed that Olympia was a religious festival long before the Olympic games were founded. Of later periods were found the great pediment groups of the Temple of Zeus, while, to crown all, in the *Hermes* of Praxiteles we possessed the only certain work which had been handed down to us of the most famous of all the Greek sculptors except Pheidias. But it was in architecture that the gain was greatest. The discoveries at Olympia had done much to elucidate what was previously obscure; a new light had been thrown on the origin and form of well known types of buildings, while structures which we should have rejected as not being Hellenic at all had almost revolutionised our former notions of Greek architecture. The mention of Olympia, the Professor went on to remark, called up an institution that had not only importance for the historian of art, but was in a sense the spiritual centre, the very heart of Hellas. Standing in the sacred grove of the Temple of Zeus, we should have had around us monuments, not only of the Greek love of beauty, but of Greek religion, Greek patriotism, Greek social and family life; the strength and the weakness of the people could be read in their buildings, the works of art, the inscriptions, and the aspect of the crowd that thronged the place on festive occasions. A somewhat detailed account was then given, with the help of maps, diagrams, and drawings, of the topography of Olympia, of the history of its great celebration, and of the mode of carrying out the various games which occupied the successive days of the festival; and, in concluding, the Professor remarked that it was quite characteristic of Greece that the most famous and longest-lived of all her institutions was a festival, and that the leading feature of this was a

series of prolonged and arduous contests for the sake only of victory and fame. The Greek love of such contests sprang entirely from Greek idealism, from that ever fresh and buoyant impulse to rise from out the commonplace surroundings of actual life into a region where thought would move in perfect freedom. Some might call this region an unreal one; but to the Greeks this was the real thing in life, because it was their own creation—a thing they had made. So they strove and interested themselves in the strife of others for a crown of wild olive or parsley, and for fame; and this fame was not a sordid object—it was the sense that they themselves had fulfilled the highest function of their being, and that others realised and noted what they had done. The games became in a true sense their most serious achievement, and of all that the Greeks had left us, perhaps nothing was of such value as their constant testimony to the worth of ideals, their determination not to be bound down by circumstances, but to build for themselves in freedom a spiritual house of life. This, which was the keynote of Plato's greatest thought, was also, in another form, the spirit which ruled in those national festivals.

## BIRMINGHAM ARCHITECTURAL ASSOCIATION.

THE annual conversazione of the Birmingham Association was held at Queen's College to inaugurate the opening of the eleventh session. There was a large loan collection of drawings from London, in addition to those contributed by members, together with specimens of tapestry, wrought-iron, and other materials of architectural interest. The secretary stated that the annual report and balance-sheet would be read at the first ordinary meeting. The president, Mr. F. B. Osborn, opened the proceedings with an inaugural address, in which he entered minutely into the work of the various classes and the general progress of the Association. He urged upon the younger members the necessity of connecting themselves with a society where so many facilities were afforded for the advancement of their profession. A vote of thanks, proposed by Mr. J. J. Bateman (ex-president), and seconded by the vice-president, Mr. W. H. Kendrick, was unanimously accorded to the president for his able and interesting address. After a lengthy musical programme, the proceedings terminated. Among the gentlemen present, in addition to the officers mentioned below, were Messrs. J. Cotton, W. Doubleday, R. B. Morgan, Franklin Cross, H. Lloyd, O. Askell, A. E. Radclyffe, H. Clue, T. Tonks, &c. The following is the list of officers for the ensuing session:—Mr. F. B. Osborn, F.R.I.B.A., president; Mr. W. H. Kendrick, chairman; Messrs. O. Essex, A.R.I.B.A., F. H. Hughes, A.R.I.B.A., C. E. Bateman, T. W. F. Newton, F. E. F. Bailey, A.R.I.B.A., H. H. McConnal, A.R.I.B.A., and E. Wood, members of committee; Mr. A. Reading, A.R.I.B.A., hon. treasurer; Mr. A. Hale, hon. librarian; Mr. Victor Scruton, hon. secretary.

## THE WALLACE STATUE FOR ABERDEEN.

THE competition of sculptors for the designing of the Wallace statue proposed to be erected in Aberdeen has resulted in the selection of the model submitted by Mr. W. Grant Stevenson, Edinburgh. The monument in question was projected by the late Mr. John Steill, Grange Road, Edinburgh, who bequeathed a handsome sum for the carrying out of what would seem to have been a long-cherished scheme. Competitive designs having been called for, twenty-five sculptors entered the lists; and from their models, forwarded to Aberdeen about three months ago, the trustees, aided by the artistic advice of Sir Noel Paton, R.S.A., and Dr. Rowand Anderson, architect, selected three, which their respective authors were requested to revise with reference to costume and other details. The sculptors thus placed on a short list were, besides Mr. Stevenson, Mr. J. Whitehead and Mr. Warrington Wood. The revised designs having been inspected by the trustees and their artistic assessors, the final decision was given in favour of Mr. Stevenson's. Under the terms of the competition, Messrs. Whitehead and Wood are each entitled to a premium of fifty guineas. In the successful model—which, like the others submitted in the competition, is about 4 feet high—Wallace is represented as standing on a rock, the figure being firmly poised on the right leg, and the left foot, well advanced, planted on a raised projection. The head is bared, the hair being blown back as if by a fresh breeze; and the animated expression of the features corresponds with the action of the outstretched left arm in emphasising the declaration which the champion is supposed to be making to the English ambassadors, that his purpose is not to treat, but to fight for Scotland's freedom. The right hand holds the huge sword, whose blade, forming a diagonal line across the body, seems to bar the enemy's advance. In the absence of any authentic portrait, the head is partly ideal, partly formed on descriptions of the hero's appearance. The costume, which has been studied from carved work of the period, consists of chain armour under a tunic, which is girt round the middle by the combined waist and sword-belt. A cloak falling from the shoulders,

and partly covering the left arm, affords opportunities for effective disposition of light and shade. The statue is to be cast in bronze on the colossal scale of 16 feet, and will be the largest work of the kind in Scotland. A site has been selected for it on an artificial mound in the Duthie Park, Aberdeen, where it will be placed on a pedestal of rough granite. The price to be paid to the sculptor is, we understand, 3,000*l*.

## ODDINGTON CHURCH.

THIS church was reopened on the 28th ult. On the following Saturday it was visited by the members of the Oxford Architectural and Historical Society, who chose it as the first of their term's excursions. Mr. Bruton, the architect, from whose designs the church has been restored, met the members and delivered a lecture, from which the following description has been abstracted.

This is a most interesting example of a very simple church, built very early in the fourteenth century, and consists of nave, chancel, and north aisle, to which has now been added a small vestry on the north side. This is separated from the chancel by an arch, under which is space for an organ. This description, however, may more properly be said to belong to the restored church, as, previously to the work being undertaken, there existed between the chancel and tower a large bare room of good height, with a flat ceiling, from which the tower opened at the south side of the west end, and, possibly to in some degree mask the want of symmetry this arrangement involved, the arch was neatly boarded up, and the whole carefully whitewashed, boards and all.

At the east end a similar want of symmetry existed, the chancel arch being similarly out of the centre. It had an elliptical arch constructed of framing and lath and plaster, of course jointed to represent stone; the only internal evidence of a north aisle having ever existed was to be seen on the north side of the chancel arch, where there was a semi-arch of stone springing from the north wall up to, and apparently intended to support, the plaster chancel arch. The external walls undoubtedly led to the suggestion that the arcade of the north aisle had been removed. Admitting this hypothesis, the symmetry of the church becomes apparent. Investigation proved that the north wall had been raised, and a common queen-post roof made to span the entire width. This wall being of less substance than that on the south, had in several places given way, and modern buttresses had been built against it to withstand the thrust. The roof had become very unsound and the ceiling dangerous, and many of the timbers decayed. Above the flat ceiling, and under the roof, was discovered the original water tabling, now to be seen on the tower above the restored roof. The lines of this water tabling conclusively proved the original existence of a north aisle, the centre line of the original roof being central with the tower. When the roof was removed there appeared above the central line at the east end remains of an earlier chancel arch, but further investigation proved that this was not original, for, on knocking away the plastering of the sham arch, there was found on the north side one of the original shafts of the north arcade; it was octagonal in shape, but not a perfect octagon, and on the south side was a respond or half-column to receive the thrust of the arch. That these, however, were not *in situ* was evident, and the arch was much too high for any roof that would come within the lines of the water tabling on the tower, and the fact that the shaft on the north side did not belong to its position was proved by its being an entire column instead of the usual half column fitted for such a position.

In removing the upper part of the north wall to bring it to the level necessary for the roof, it was hoped that further remains would be discovered. None of the stones, however, which were found could be said to belong to it; but several of an ornamental character clearly belonged to a twelfth-century arch, which was probably removed when the before-mentioned one was built. This, of course, was done to get a wider opening between the nave and chancel. Mature consideration convinced one that this arch and the shafts were part of the north arcade, and, in fact, the before-mentioned shaft and respond have been replaced at the west end of the restored arcade, where, it is believed, they originally belonged. The stones of the arch and of the shaft have been re-used without any disturbance of the original surface, and several of the stones bear upon their face painted scroll-work belonging to the period; there is similar work to be seen at Charlton-on-Otmoor.

The bases and capitals were too much mutilated to be re-used, the mouldings having been cut away to receive the framing of the plaster sham arch. These mouldings have been carefully reproduced in all the capitals and bases of the arcade; the new arches are also fac-similes of the discovered one. The windows of the south side of the nave and of the north aisle had been much mutilated, with the exception of the western window of the north aisle, which is original; the mullions and heads had been removed and the jambs cut away, and the space covered with a single arch. Those on the south side were nearly round-headed, and were probably rude imitations of those in the neighbouring church of Islip, built by Dr. South, who was rector of that parish in 1680.

All the inside mouldings of the arches of the windows had been cut away. The present windows are of two lights, with dripstones, having mask terminations. The north doorway has also been reopened and similarly finished. The new roof has tie-beams, with moulded king-posts, with framed rafters belonging to the period of Edward II., which has been adopted, although belonging to a slightly later period than the walls, because the walls are slightly out of upright, and this kind of roof has no thrust.

The original pulpit, upon which the date 1617 can be seen, has been re-used, and new oak benches, *fac-similes* of some fifteenth-century originals, replace the high close pews of the last century.

When the chancel roof was removed there was found built into the walls the corbel and basin of the piscina, which has been replaced; and in pulling the opening for the new vestry arch there was found a two-light window of the period of Henry VII., and on the south side, nearly opposite, a very rude copy of the same. This, however, being too much mutilated, has been removed, and the better one, found in the north wall, substituted. The roof of the chancel is of a similar character to that on the nave, replacing a brackotted plaster ceiling, elliptical in section.

The choir seats and vestry screen harmonising with those in the nave, but somewhat more rich in character, have also been executed in oak. New oak chancel rails have also been added, with iron standards.

The remarkable fifteenth-century brass in the chancel—a skeleton in a shroud, with worms crawling in and out, to Radulph Hamsterley—has been carefully preserved and replaced. The masonry of south door and porch has been reset. Oak doors, with suitable iron-work, to north and south entrances have been provided, and the porch re-roofed. Handsome stone crosses have been also placed on the gables of chancel, nave, and porch.

The work has been executed by Messrs. Silver, Sons & Filewood, from the designs and under the direction of Mr. Edward G. Bruton, architect, of Oxford, and surveyor for the diocese.

### WESTMINSTER HALL.

THE First Commissioner of Works has agreed that the Select Committee which has been nominated to "examine and report on the proposed plans for the restoration of the exterior of Westminster Hall," should be allowed to inquire into the whole subject, and not be confined to the proposals of Mr. Pearson. Mr. Mitchell Henry, M.P., says:—The matter is of great moment, for if a mistake is made now it can never be repaired, and the outside public know little of the facts in consequence of a hoarding having been kept round the locality, which only members of the Legislature and favoured persons have been able to penetrate.

Mr. Henry also writes:—The demolition of the old Courts of Law has disclosed the existence of a series of ancient Norman buttresses, built in all probability by Richard II., about the year 1394, for the purpose of strengthening the external wall of Westminster Hall, when he made great alterations in the building and erected its existing magnificent timber roof. As is well known, the hall itself is some 300 years older, having been built by William Rufus in 1097, and it has associations with the great events of our history that render it only one degree less sacred than Westminster Abbey itself.

The Norman buttresses of Richard II. are by no means beautiful, but they must be preserved not only on account of their antiquarian interest, but for structural reasons involving the stability of the building. Mr. Pearson proposes to utilise them in order to form an underground cloister for the carriages and horses of members of Parliament, and to erect over this a two-storeyed building in imitation of what is supposed to have existed before. On inquiry we were informed that the upper floor of this building could be used as a storehouse for stationery and Parliamentary papers. Surely these proposals must insure their own condemnation. One trembles to think of stores of inflammable materials in near proximity to the timber roof of Westminster Hall; while the proposed elongated cabmen's shelter, 12 feet high and 19 feet broad, with no exit at the other end, and with all the *agrément*s incidental to the animal life of the men and horses, are little in accordance with the great traditions of the place.

Far from putting fresh buildings in this situation, I venture to say that as the removal of the Law Courts has given us this clear space, it should be kept clear, and only a screen or stone facing be permitted to interfere between Westminster Hall and the Abbey, now for the first time fully displayed in all its beauty. The interior of Westminster Hall itself is dark, cold, and so deficient in light that the matchless timber roof can with difficulty be discerned; but if the spaces left in the walls by the doors of the old Law Courts, and the windows over them, were replaced by suitable Gothic fourteenth-century windows, filled with stained glass, the splendour of the hall and its wonderful roof could be worthily seen. Of course such windows would be placed in regular sequence, and could be opened in the wall when required.

I say nothing as to the future use of the hall or whether it would make an appropriate Valhalla of the nation to the relief of the abbey, now so painfully crowded as to look like a sculptor's

studio, because this is a very serious and complicated question upon which opinions will widely differ. Few, however, will object to the better lighting of the hall, or to its preservation from ignoble associations and the risks of fire, and I think there are not many persons who will desire that the proposed plans should be rushed through Parliament without such a complete and searching inquiry as is not now contemplated, or at any rate was not contemplated when the motion came on.

In the meantime, the external buttresses should be carefully protected by timber from the effects of the weather. Parliament granted a large sum of money for this purpose at the close of last session on the plea of urgency; but how little those who raised this cry believe in it, may be learned from the fact that since then nothing whatever has been done to the buttresses. In short, the questions at issue are national questions, and although we all have the greatest confidence in the present energetic First Commissioner, it is neither just nor expedient that the Board of Works and one architect should treat this matter as though it was an everyday affair, not allowing of differences of opinion.

### SANITARY INSTITUTE OF GREAT BRITAIN.

AT an examination, held November 6 and 7, twenty-seven candidates presented themselves, eight as local surveyors, and nineteen as inspectors of nuisances. The Institute's certificate of competency to discharge the duties of local surveyors was awarded to Messrs. B. R. Phillipson, J. E. Worth, and Gilbert Thomson; and to discharge the duties of inspectors of nuisances to Messrs. W. Daley, J. Brooks, J. Houghton, J. Neal, T. Wheat, W. Fraser, J. Loach, J. Marshall, F. S. Winsor, J. T. Simpson, A. H. Rollinson, and Ben Potter.

The following are the examination papers:—

#### Local Surveyors.

1. On what subjects, and under what conditions and restrictions, may by-laws be made under the Public Health Act, 1875:—  
(a) By urban sanitary authorities? (b) By rural sanitary authorities?

2. What are the powers and obligations of urban and rural sanitary authorities with respect to water supply within the area of their several districts?

3. What volume of sewage would you provide for at the outfall sewer from a town of 10,000 population, the drainage area being 550 acres, taking 25 gallons per head of water supply and  $\frac{1}{2}$ -inch rainfall in 24 hours?

4. Give a specification and make a sketch of a water-tight sewer. Describe and give a sketch of the form of manhole which you consider best adapted for ordinary town sewers; and state the rule which you adopt for determining the amount of ventilation to be afforded in the main street sewer.

5. In what way does the size and shape of a sewer affect the velocity of the sewage flowing through it? If a 12-inch pipe sewer, with an inclination of 1 in 175 gives a velocity of  $3\frac{1}{2}$  feet per second, what velocity would it give if laid at an inclination of 1 in 700 (the pipe running half full in each case), and would this latter velocity suffice to keep the sewer clear of deposit? To what extent could this velocity be practically increased by flushing?

6. Describe in detail what precautions should be taken, in connecting houses with sewers, in order to prevent the foul gases from the sewers entering the houses? Illustrate your answer by a sketch.

7. In providing a water supply for a town, what are the chief points to which you would direct your attention if the supply is to be derived—(a) from wells; (b) from streams?

8. What is meant by "constant" and by "intermittent" water supply? Explain the advantages and disadvantages of each. Can a constant supply of water become polluted inside a house where there are no cisterns, and if so in what way? What precautions are necessary to be taken to prevent water being polluted inside a house?

9. Describe the construction of an ordinary rain-gauge, and the precautions which should be taken in fixing it. Give instances of the amount of annual rainfall in various places. What weight of water does one inch on an acre represent?

10. Make a figured sketch of the main front and back walls of a house of four storeys, including basement, showing the proper minimum heights of the rooms and the thickness of the walls.

11. What are the most important points to be considered in examining the ventilation of a room? How much cubic space would you require per head—(a) in sleeping rooms; (b) in rooms used for living and sleeping?

12. Make a sketch, and describe in detail the construction of a first-class macadamised road with footpaths.

#### Inspectors of Nuisances.

1. What powers are lodged in local authorities with respect to the prevention of infectious and epidemic diseases?

2. What are the provisions of the Public Health Act with regard to cellar dwellings?

3. Describe some efficient and simple means of ventilating sleeping-rooms. What do you consider over-crowding?
4. In inspecting premises, to what points would you direct your attention to ascertain whether the water-supply is wholesome? (a) In the case of a water-supply derived from wells? (b) In the case of the water being supplied from a town main into a cistern?
5. How should the soil pipes, sink pipes, and overflow pipes of a dwelling be dealt with, so as to prevent any danger to the inmates? What do you consider a proper fall for a 6-inch house drain, and how should it be connected with the public sewer?
6. Describe a bell-trap, a D-trap, and a pan watercloset. State the objections to each, and illustrate your answer by sketches.
7. What are the characteristics of good meat? How do you recognise unwholesome meat and fish, and what are the powers under which they can be seized and condemned?
8. In the inspection of a slaughter-house to what points would you particularly attend?

## MANCHESTER ARCHITECTURAL ASSOCIATION.

THE first ordinary meeting of the above Association took place in the Old Town Hall, King Street, on the evening of Tuesday, November 11.

The Vice-President, Mr. A. H. Davies-Colley, A.R.I.B.A., in the absence of the President, Mr. J. Medland Taylor, M.S.A., addressed the meeting. Mr. Colley was of the opinion that architects were of late years receiving more public attention, and that people were gradually becoming convinced how necessary the profession was for their daily wants and comforts. He thought that the adoption of a professional referee in recent competitions was a very decided and important advance in the welfare of the profession. He argued that the demands on the architect had of late years greatly increased, and that division of labour was very desirable for the production of good work. Those young men would in the future succeed best who, having mastered the groundwork of their profession, devoted their time to one special branch of our calling. He showed that such a state of things existed in the legal and medical professions. Mr. Colley referred to a proposal that the Liverpool Society and the Manchester Association should combine together in the publication of a Sketch-book. He urged its advantages, and thought the scheme feasible.

The prizes for the session 1883-84 were awarded as follows:—*Elementary Class of Design*: 1st prize, Mr. P. E. Barker; 2nd prize, Mr. T. R. Wrigley. *Elementary Class of Construction*: 1st prize, Mr. T. L. Worthington; 2nd prize, withheld.

Mr. T. Chadwick, A.R.I.B.A., rose to support the suggestion concerning the Sketch-book. He referred to the work of the Manchester and Salford Sanitary Association, and spoke of a set of lectures about to be delivered at the Mechanics' Institution, Princes Street, between November 13 and March 26. He hoped that members would attend and benefit by them. He thought that the results of many attempts made to house the poor had proved very discouraging to philanthropists. He referred more especially to some tenements in the neighbourhood of St. Mary's Church, Beswicke, where the tenants greatly abused the conveniences provided for them, wilful damage being often inflicted on the furniture.

Mr. J. S. Hodgeson supported the proposal concerning the joint Sketch-book, and commented on Mr. Colley's remarks.

Mr. F. W. Mee and Mr. J. H. Woodhouse also addressed the meeting.

Mr. T. L. Worthington suggested that steps should be taken to bring the Manchester Society of Architects and the Association in more direct connection, more especially as regarded the prizes offered annually to students.

Mr. J. Brooke, A.R.I.B.A., opposed such a suggestion, and thought that the two bodies had different motives and interests.

## THE PROGRESS OF THE MERSEY TUNNEL.

THE representatives of the Mersey Railway Company have been engaged in an examination of the works on both sides of the river, and in making the final arrangements for the completion of the three and a half miles of line, so as to be ready for the opening. A very few yards of the spacious tunnel under the Mersey now remain to be opened out and bricked in the several sections still unfinished, and these will be completed, so far as the arching and bricking above is concerned, before the present month closes. There remain, however, certain parts of the invert or lower part of the egg-shaped tunnel to take out and brick, and these will take some six weeks before the ballasting can be laid down and made ready for the steel rails with which the permanent way will be made. To the eyes of the stranger, however, the tunnel might appear less near completion in some parts than it did some time ago. The rock saved from the excavation for the purpose of ballasting is stacked along the sides of the structure

for long distances, leaving only room for the trucks to run down the centre. A short time will, however, suffice to dispose of this. Meanwhile, on the Liverpool side landwards the works are complete of the full size to St. Peter's Churchyard, Church Street, and will be pushed forward up the street to form the terminal station. At St. James Street Station the excavation for the lift and staircase is progressing rapidly, the spoil being sent down into the tunnel by two shoots to form ballast for the line. The contract for the station buildings, which have been designed by Mr. Charles Grayson, architect, has been let. These buildings will form an imposing structure, being faced with stone, and comprising a water tower between 80 feet and 90 feet in height. The machinery for the three lifts—each of which will accommodate eighty persons—is in a forward state, and the whole will be completed for service by the time the railway is finished, leaving the rest of the buildings to be completed at greater leisure. In order to give additional accommodation to the immense cross-river traffic for business purposes the Mersey Railway Company have decided to apply to Parliament in the ensuing session for power to construct an inclined approach from Water Street to the James Street Station, along the line of Drury Lane, so that the whole trainful of passengers may be disposed of in two minutes. On the Birkenhead side the excavation for the Hamilton Square Station is completed, and this station, with those at the Borough Road and Green Lane, will be ready by the time the line is ready for traffic. The contractor will have his work done in four months.

## STEAM HEATING.

AT a meeting of the Liverpool Engineering Society on the 5th inst., Mr. R. R. Bevis, jun., president, in the chair, a paper was read by Mr. W. E. Mills on "Steam as a Mode of Heating." The author began his subject by pointing out the advantages possessed by steam over hot water as a mode of heating large buildings. Steam, from its own elasticity, would permeate every part of the system of pipes in which it was employed equally, while water, being itself inert, required power to drive it, especially if the length of piping was at all extensive, and this involved the use of a boiler of considerable dimensions. Owing to the severity of the winters in America rendering some means of artificial heating absolutely necessary, even in dwelling-houses and buildings of moderate dimensions, more powerful than a hot-water apparatus could supply, steam had been adopted in that country to a large extent. The author next proceeded to show, by the aid of diagrams, the arrangement of the supply and return mains, and described the construction of the coils or radiators by which the heat was transmitted to the floors and walls of the building. Inasmuch as by the use of steam a greater degree of heat could be communicated to the piping than was attainable with a hot-water apparatus, the superficial area of the coils and pipes in the former case could be much reduced without impairing the beneficial effect. The author next described the application of steam for the purposes of cooking, and gave details of the vessels and connections best adapted to the system. A discussion followed the reading of the paper.

## A FLOATING HOSPITAL.\*

ONE of the wisest acts of the Metropolitan Asylums Board, since its formation, was the acquirement of the *Castalia* (which was originally built on the twin principle for the prevention of sea sickness), and the conversion of the vessel into a smallpox hospital on the Thames. The deck area being extensive it has been found practicable to construct several pavilions and (as will be seen from the plan) to arrange them in such a way as to insure the largest amount of light for each, in addition to unimpeded ventilation. These advantages are important when it is remembered that 200 patients can be received in the *Castalia*. Knowing that in many hospitals there is inefficient ventilation, the Metropolitan Asylums Board invoked the aid of several experts on the subject, Professor de Chaumont being the principal adviser. After careful inquiry it was decided to adopt Messrs. Robert Boyle & Son's system of ventilation, as being the best and most suitable for the purpose. The Local Government Board approved of the selection, and Messrs. Boyle duly received instructions to proceed with the work.

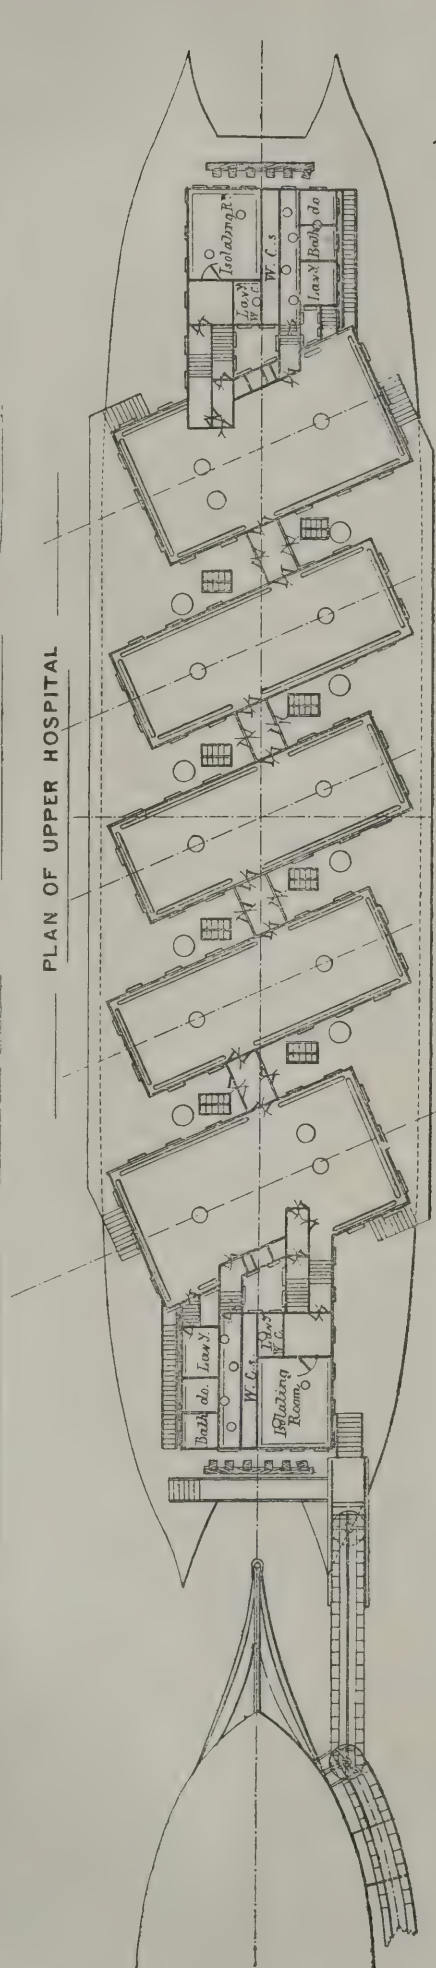

As this is one of the largest and most important ventilating contracts that the firm has yet undertaken, and is considered to be one of the most unique examples of ventilation in this country, or indeed in the world, it is deserving of a detailed notice. For the extraction of the vitiated air there are provided twenty of the self-acting air-pump ventilators, each 6 feet in diameter, connected with the wards by means of iron shafts, measuring from 30 inches to 4 feet in diameter. There are also sixteen air-pump ventilators, 3 feet in diameter, connected with the waterclosets, lavatories, bathroom, and other offices. Fresh air is admitted all round the wards by means of openings cut through the walls at the floor

\* See illustration on page 323.

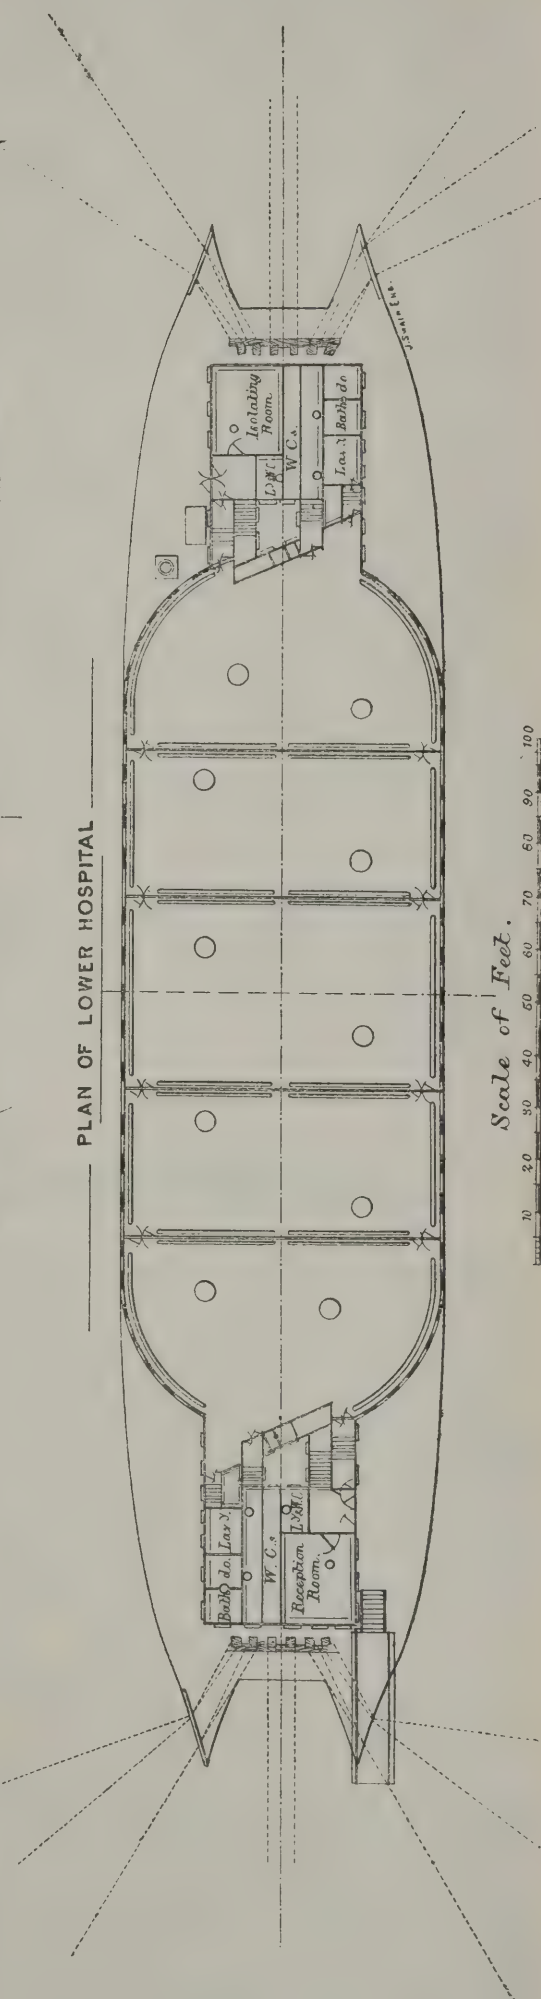

SIDE ELEVATION

PLAN OF UPPER HOSPITAL

PLAN OF LOWER HOSPITAL

level. The air passes over hot-water pipes which are encased in a false skirting made of iron, perforated at the top to permit of the air being equally and imperceptibly filtered in and diffused throughout the wards. The supply of air is regulated by valves or shutters worked by means of screws. This arrangement is that of Mr. Adam Miller, engineer to the Board.

Several scientific and medical men watched the progress of the work, and much interest was excited as to how it would answer. Experiments were therefore instituted by the Board in order to test the efficiency of the system. The results were most satisfactory, indeed, they are stated to have been far beyond anything that was anticipated. After an extended series of experiments to test the air-pump ventilators under atmospheric changes, such as when there was a good wind blowing, and when there was no wind at all, it was found that the ventilators extracted at the rate of 5,000,000 cubic feet of air per hour, the air in the wards being entirely changed once in every five minutes, whilst there was not the least disagreeable draught. During the whole of the tests no appearance of a down-draught was found in the ventilators. Several anemometers were placed in the shafts of the ventilators, and the readings were taken every two hours. Anemometers were also fixed outside to register the velocity of the wind. Messrs. Boyle were not present at any of these tests except the first, the engineers and experts appointed by the Asylums Board being alone entrusted with the trials. Dr. Bridges, Chief Inspector of Hospitals, after carefully investigating the system, expressed his full approval of its action, informing Messrs. Boyle that even when he tested it in a calm, he found a considerable up-draught in the shafts, and at no time any down-draught. Sir Charles Dilke, and other members of the Royal Commission on the Dwellings of the Poor, visited the *Castalia* for the purpose of examining its arrangements, and expressed themselves satisfied with all they saw. Messrs. Boyle applied their system to the *Castalia* under a guarantee, and it is evident that the Asylums Board was satisfied that all the stipulated requirements had been fulfilled, and the system a success, when it is mentioned that immediately after the conclusion of the experiments their account was paid. The system is also applied to the ambulance and transport steamers *Redcross*, *Endymion*, and *Albert Victor*.

From their practical character, the value of these experiments must be very great, as they demonstrate the true worth of Messrs. Boyle's system, and its capabilities. There is only one trustworthy way of proving the efficiency of any ventilating arrangements, and that is by actual and extended practical experience. Lecture-room experiments, as all privately conducted experiments can only be called, may be all very well in theory, and show certain results, but in actual practice the results are generally found to be very different.

#### Awards for Ventilation at the Health Exhibition.

SIR,—With reference to the inconsiderate letter from Robert Boyle & Son, in your issue of last week, I may state that the writers are in error in at least three points with which I was concerned:—

1. They were *not* excluded from the testing-rooms.
2. They were invited by me, in a letter dated the 9th September last, for the July 10, to send their ventilator for testing, in the same terms in which other invitations were issued. I hold their acknowledgment of receipt of that letter of invitation, dated September 12, in which they state that they cannot comply with my request.
3. "The bottoms of the pipes attached to the ventilator" were *not* inside the "tube," as they call it, which was 10 feet in length, not 8 feet. They were outside, and completely isolated from the action of the current.

For the remainder of the letter, which is only abusive, it does not require any notice from me.

Yours obediently,

D. K. CLARK, M.Inst.C.E.

Testing Engineer to Jury 10.

8 Buckingham Street, Adelphi, W.C.:

November 11, 1884.

SIR,—Like Messrs. Boyle, I received no notice to produce a ventilator for trial, and it was only a short time before the trials took place that I heard a rumour about the matter.

Being very much interested in the subject I made inquiries as to where the trials were to take place, and, after some trouble, and greatly to my astonishment, I found the place to be a back room on the first floor of a partly-finished house, viz., 9 Moreton Gardens, Brompton. There I saw the selected ventilators—they were of all sizes. One which has received a medal was a huge affair, about 6 feet high and 4 feet wide; also two or three monstrous cowls nearly as high as the

room, and others varying in size down to about 8 inches, so that under whatever circumstances the trial took place, I utterly fail to see how the small ventilators could compete on terms of equality with the huge monsters pitted against them.

I saw the large wooden tube arrangement, fan, &c., as described by Messrs. Boyle. The fan was driven by *hand* power, and of course the velocity of the blast could not be equal, but could be varied to any extent, and the whole thing appeared to me to be a perfect farce.

The jury should have had a temporary wooden structure erected in the open air, equally divided inside into as many compartments as there were competing ventilators, and each compartment to have had an air inlet, also of equal size, and all in the same side of the structure, and over the centre of each little room a ventilator should have been fixed—all ventilators to have been of equal dimensions as to height, width, and uptake pipe. An anemometer placed in the throat of each ventilator would have registered the extracting power, and the whole thing should have remained intact for one month exposed to all kinds of weather.

It is well known that many ventilators will not act properly when exposed to an open air test such as I have suggested, fog, rain, and dense atmosphere being so prevalent in this country that unless a ventilator will act during all atmospheric changes of the weather it is practically useless, and I fully expected that a most exhaustive trial would have taken place to thoroughly test the respective merits of the various ventilators exhibited.

I received a notice to meet the jury, and went up to town four times for that purpose, but on each occasion they failed to pay me a visit. I think it is, to say the least, an error of judgment on their part in not sending a notice to each exhibitor to produce a ventilator for testing purposes, and, in fairness to the exhibitors, the awards in Class 25 should be readjusted, as there are several very meritorious exhibits entirely ignored.

I Blagrove Street, Reading:

November 10, 1884.

Yours very truly,

GEO. W. WEBB.

SIR,—In your issue of the 8th inst. we see Messrs. Robert Boyle & Son appear to be suffering most acutely for their failure in obtaining the principal award for ventilators at the International Health Exhibition. But we have no doubt most ventilator makers will agree with us when we state that this is the first exhibition in England where ventilators have ever been *tested* in the proper sense of the word. In compliance with a written invitation from the testing engineer, acting on behalf of the International Health Exhibition Jury, No. 10, we sent a 9-inch ventilator to the "testing house," No. 10 Moreton Gardens, having first called to ascertain the mode by which the proposed contest was to be carried out. Finding that the *modus operandi* was as fair for one ventilator as another, whether of the firm of Messrs. Robert Boyle & Son, other makers, or our own, we decided to send our ventilators. Now, the purport of our present remarks is *solely* to refute *mis*-statements contained in Messrs. Robert Boyle & Son's letter; the good taste it displayed we leave your readers to judge. The tests were certainly not carried out in the manner stated by Messrs. Robert Boyle & Son. When our ventilators, the rotating cowl and the fixed finial ventilator, were delivered at the "testing house," our representative noticed that several other makers had previously sent their ventilators. He inquired if Messrs. Robert Boyle & Son had sent. The reply was in the negative. Inquiry was then made whether invitations for this contest had been sent to all exhibitors of ventilators, and an affirmative reply was received. After this, inquiry was made at Messrs. Robert Boyle & Son's exhibit whether they intended to send one of their ventilators to the "testing house." Their representative's reply was worthy of his employers:—"Oh no! our ventilators are sufficiently well known to the jurors," &c. It is therefore clear that Messrs. Robert Boyle & Son must have been aware that tests were being made, even assuming that the invitations to the contest did not reach them. Without regard to efficiency, they at once attempt to disparage another maker's ventilator, on the ground that "it is an old-fashioned and out-of-date cowl, which was patented some quarter of a century ago." It happens that this particular ventilator far surpasses Messrs. Robert Boyle & Son's air-pump, which is to all intents and purposes constructed upon identical lines, with additions which are the reverse of improvements. In speaking of our ventilator, Messrs. Robert Boyle & Son attempt to cast discredit upon the decision of the jury by saying that, Mr. J. P. Seddon being a friend of ours, we had been awarded *five* medals. If Messrs. Robert Boyle & Son were not so rash in their misstatements, they would have seen that our exhibits came under three or four classes, and consequently must have been adjudicated upon by as many juries; hence even Messrs. Robert Boyle & Son must admit that excellency alone has accounted for our success, and this fairly shows it was well deserved, and was not dependent on the advocacy of any individual who may have stated his opinion that Messrs. Robert Boyle & Son's air-pump is a very inefficient ventilator. We have before challenged Messrs. Robert Boyle & Son to a single combat, and we now do so again on the same terms: the loser to pay expenses of contest, and to forfeit his or their 100*l.*, which shall be paid to some charitable

institution; and we will further agree to forfeit the medal which has been awarded to us at the International Health Exhibition if we are the losers. The challenge to be taken up within one month from date, after which time, if not taken up, we shall consider that Messrs. Robert Boyle & Son admit the superiority of our ventilators over their so-called Self-acting Air-pump Ventilator. We regret being obliged to ask you for so much valuable space, but we do so in the interest of fair play and justice.

Yours very truly,  
BANNER BROS. & Co.

#### The Institute Diploma.

SIR,—Although it may seem presumptuous on my part to take up this matter after reading the concluding sentence of your correspondent's letter in last week's issue, still I should like to make a few suggestions on the subject of the Diploma he advocates. The "Diplome d'Architecte" works well among our French brethren; why should it not work equally well here? Because, I suppose the reply will be, we are a nation with non-academic notions, and refuse to be fettered by laws of art which in other countries reign supreme. Very good, according to our insular notions; but, still, as has been shown in Mr. White's able paper read at the Institute the beginning of this year, we might with advantage borrow a few ideas from the French mode of art training. The principle Mr. Mowbray advocates is a good one, but the application; I take it, is the weak point of his suggestion. We have a Royal Academy of Arts to which all classes yield more or less obedience. Why not let the Diploma emanate thence? As a profession we want more countenance from this leading body or art guild; for are we not an integral part of its constitution, with our school and annual exhibit within its walls? Moreover, this would be a graceful recognition on its part of an art that in reality comprises all others. This Diploma then, coming from the, I may say, acknowledged head of the artistic world here, would be able to embrace all able members of the profession, whether belonging to any society or not. Let its motto be "*Palmarum qui meruit ferat*," and its success will be assured. I would humbly suggest that a Commission should be appointed, not so much to examine the applicants for the honour, as to judge of the merit of their actual work executed or otherwise. An examination on the lines of that for associateship at the Institute would be a manifest absurdity, for how many really able architects would care to have to pass a severe test in advanced mathematics who nevertheless have executed buildings of the most intricate and difficult construction. Of course to certain members of the profession the Diploma would be granted without question—*Cela va sans dire*. Finally, I would further suggest that it be granted in the same manner as the membership of the Academy—by application. Should this idea of Mr. Mowbray's, by the sanction of Parliament, happily become law, we may hope in time to see the honest followers of a noble profession brought forward to the place they ought by right to occupy, and their unworthy imitators relegated to the limbo of deserved obscurity. Then, perhaps we should see less of that pretentiously crude building, a jumble of all styles and an outrage against all laws of proportion and canons of art, which in so many places in this country of ours has usurped the name of architecture.

I am, &c.,

PERCY G. STONE.

16 Great Marlborough Street, London, W.:

November 11, 1884.

#### The Crime of Youth.

SIR,—Some remarks in your leader of November 8 on the opening meeting of the Royal Institute of British Architects will hardly commend themselves as sound to young men in general, nor perhaps to all men of "age and experience." Your contributor assumes that youth has carried off the late competition for the Government offices. If I am not mistaken, I think I can remember the names of Leeming & Leeming as a firm in practice quite a dozen years. But, apart from this, is it not generally the case that a man of talent and genius comes to the front in early youth? One is tempted to imagine that your contributor may be some elderly gentleman who has plucked more sour grapes than ripe plums under the competition system. Possibly he entered the lists in the late competition, and found that "age and experience of the best" must be judged according to merit, rather than to undoubted age or supposed experience—for the writer cannot be a young man. Surely Street, Scott, Burges, Pugin, &c., were once young men; none of them, unless it were Scott, ever lived long enough to be old. But would your contributor assert that a "learned society" would have been turned into a "debating club" because any of these geniuses had read papers or joined in debates when they were emphatically young men? I know plenty of worthy old buffers, with plenty of age and lots of experience, who would never set the Thames on fire, to whom it comes easier to talk twaddle than sense.

I am, Sir, yours obediently,

A YOUNG MAN.

#### The Restoration of Westminster Abbey

SIR,—In February last a communication was published in one of your daily contemporaries, stating that the ruinous condition of the abbey required the immediate expenditure of about 80,000*l.*, and giving a lamentable picture showing decay to have been its normal condition for centuries. No separate funds appear to have been set apart for the repairs of the fabric in pre-Reformation times; but as the abbey was in close connection with the Crown, as kings were crowned and buried in it, and as the abbots were individually rich, there was not in those days much difficulty as to the necessary outlay.

Under Henry II. Abbot Laurence obtained a grant and leave to impropriate livings from the King and the Empress Maud; and Henry III.'s benefactions were continued by many of his successors. But in Edward IV.'s time the fabric required a special effort. In 1478 the King wrote a letter to the Pope, in which he said:—"We pray you that the Apostolic See should condescend to succour the monastery, which is now not only tottering, but almost fallen, and which is on the point of utter ruin." From 1600 there are a few records of expenditure. Dean Williams spent 4,500*l.* on the exterior of the chapels. Dean Dolben prevailed upon the Chapter to devote henceforth one-fifteenth share of their incomes. In 1697 a petition from the Chapter to the House of Commons stated that since the Restoration they had expended 20,000*l.*, and that 40,000*l.* was then urgently required; whereupon an Act was passed assigning one-sixth of the duty on coals imported into London, "for the repair of the collegiate church, and for no other purpose whatever," until 1716. After this a new Act was passed, and then commuted, by which 4,000*l.* appears to have been paid annually till 1741. In 1807 the Chapter state in a petition that they have expended during twenty years nearly 29,000*l.*; whereupon grants amounting to 42,000*l.* were made between then and 1822. Since that time to the transfer of the estates to the Ecclesiastical Commissioners, the one-fifteenth share agreed to in Dean Dolben's time was always devoted to the fabric repairs.

And yet, as stated in the architect's recent report, this constant expenditure has been quite insufficient to keep the abbey in proper repair:—"Beneath the coating of grime and dirt which conceals from the eye of the casual passer-by, there has long been going on a process of decomposition which, if not arrested, must speedily cause the ruin of the building. The decay of the wall surfaces has penetrated 7 inches or 8 inches. In some places the walls are dangerous, pieces of stone constantly falling upon the roofs below." The communication I have referred to goes on to state that negotiations between the present Dean and Chapter, the Ecclesiastical Commissioners, and the Government were in progress for the expenditure of 80,000*l.* upon a general restoration of the exterior of the abbey.

And preparations for this are going on, but the lamentable and touching historical sketch of the fabric which I have just given will probably suggest to others, besides myself, the inquiry whether something durable rather than perishable cannot be done in this nineteenth century, when science works such wonders that we have scarcely gained our breath over the astonishment of one discovery before we are startled with another.

As the report says nothing as to any improved method of procedure on the new masonry, and as this is a national building of unequalled historic interest, I trust I shall be pardoned by the accomplished architect to the Chapter for venturing to recommend a simple but effectual safeguard for the future.

To restore the abbey as it has hitherto been restored—only to require re-restoring by the next generation, or sooner—will be such a disgrace to us that surely the possibility of it only requires to be stated to secure adequate care being taken for its avoidance. Happily, in this case, there is no practical difficulty. All that is necessary is to determine to adopt a wise economy, the spending of a little extra money at the outset upon the best and most durable material, instead of blindly following the foolish customary practice of the present day, of using a soft absorbent and, therefore, perishable stone, for the sole reason that it is easy and consequently cheap to work. All Government works are at present executed with perishable Portland stone. To select a stone that admits of abundant elaborate carving at little cost is, perhaps, pardonable in a second or third-rate building, erected under the short leases common in London, but in the case of our noble abbey, or any other national structure, assuredly no condemnation of such a course can be too strong. We have daily before our eyes in London the evidence of materials that are of everlasting durability, and also of those that perish sooner or later. With our lamentable experience at the royal abbey, of the decay of Sir Charles Barry's Treasury, of one of the porticoes of St. Paul's giving way, of our yearly expenditure of 2,500*l.* on the restoration of the Houses of Parliament, of 82,000*l.* recently spent on the Archbishop's palace in Lambeth, and the costly repairs of numerous other limestone buildings, is it possible that we can longer continue to build in a manner rather reminding us of the puerile efforts of our boys on the seashore than of the solid works of past ages, that have come down to our own age untouched by the hand of Time? I need not here repeat the remedy for this regrettable state of things, which you, Mr. Editor, have more than once

allowed me to lay before your readers (the appropriate use of the igneous rocks), because it is applicable rather to a new edifice than to the restoration of an old one like the abbey. But the *principle* is applicable to both. The abbey is striking in effect from its magnitude and complexity of plan. Its style and details are very simple. The slight difference of cost, then, of the labour in working a hard and durable stone instead of a soft and perishable one, should be accepted without hesitation in the interest of true economy. I therefore venture to urge those who are responsible, and who doubtless feel that they are acting in this matter for the nation at large, to examine the perfect state of the stone of the Nelson monument in Trafalgar Square, built about forty years ago. It is a carboniferous sandstone from the Craigleith Quarry, near Edinburgh, and its durability in the acids of the London atmosphere is remarkable. This doubtless is due to the large proportion of silica in its composition, namely, 98.3 per cent., and its small percentage (1.1) of carbonate of lime. Portland stone, now universally and most mistakenly used for Government buildings, contains, on the contrary, only 1.20 per cent. of silica and 95 of carbonate of lime—a material rapidly destroyed by the acids which abound in our atmosphere. Craigleith stone has been largely used for public and private buildings in Edinburgh, including the University, Law Courts, Exchange, National Monument, and numerous churches. In colour it is much warmer than Portland. There are English stones of very similar quality and of equal durability, but I have specially noticed Craigleith stone, because there is in London proof of its imperishable nature within a few yards of the abbey. Among others, I may mention Darley Dale stone, with 96 per cent. of silica; Heddon, with 95; Kenton, with 93—all which would probably be as durable as Craigleith stone. It is true that this silica renders these stones very hard; but machinery is available which converts the toughest materials with surprising rapidity into blocks suitable for building; and, as I said before, the architectural details of the abbey are so simple that the quantity of hand labour, in addition to the mechanical work, would be small. The question then is—Shall Westminster Abbey be *permanently* restored with a hard stone or *temporarily*, with misplaced economy, with soft perishable stone?

Yours truly, T. V. S.

#### Publication of Tenders.

SIR,—Will you kindly give us your opinion on the following point of professional etiquette? We tendered a few months ago (in response to an advertisement) for reseating St. Cuthbert's Church, Darlington, with oak seats. Tenders were sent to Mr. F. Parr, architect, Darlington. Some weeks after that, in reply to our second letter of inquiry, the architect replied that the contract was let to Mr. A. B., of C.

We wrote him very civilly, asking for information as to the amount of the accepted tender, saying that we always liked to have an idea how our tender ran by judging it by the accepted one. Mr. Parr replied:—"I must certainly decline to give the information requested, and I may add that yours is the first application that I have ever received to disclose the amount of the accepted tender." To this we replied that during forty years' experience we had never known such information to be refused, and stated that we generally found architects and building committees only too glad to furnish the information, and thus show to the public, and especially to competing contractors, that they were fairly dealt with.

To this Mr. Parr replied:—"I beg to reiterate the assertion made in my former letter, that yours is the first formal demand I have received to disclose the amount of an accepted tender; and allow me to add to the knowledge you have gained in *forty years' business connection*, that a tender is a private document, and unless it is stated that the amount of the tenders will be published, neither the architect or proprietor have any right to disclose the particulars of any such tender. Kindly permit this correspondence to drop here."

We should feel obliged by your opinion on this matter, as to whether Mr. Parr's letter expresses the rule of the profession, or whether our very civil inquiry was usual and in order.

Yours truly,

GEO. GRADON & SON.

Durham: Nov. 12, 1884.

[There is nothing unusual in a request by a contractor for information respecting tenders. It will sometimes happen that the amount of the accepted tender has to be kept secret, as in cases where building owners wish to make the public believe that they are about to expend a larger sum on their premises; but there should be no concealment in regard to the publication of contracts for churches or other public buildings.—ED.]

#### The Derby Asylum Competition.

SIR,—There is a rumour in the air that one of the competitors of the Derby Lunatic Asylum competition has had his design rejected on account of his estimate—32,000*l.*—being too high. This, of course, is too good a joke to be true, as I should suppose

the Derby authorities would know from experience that nothing like that sum would be sufficient to carry out the work. This competition has been about a most unreasonable time, and I believe I am justified in saying that the whole of the competitors would feel more justly treated if a competent and independent assessor was called in to advise the committee, not only as to the merits of the designs, but also as to the trustworthiness of the estimates.—I enclose card, and am, Sir, &c.,

November 12, 1884.

T.

#### REVIEWS.

FLATLAND. By A. SQUARE. (Seeleys & Co.)

In this book we have an account of a country that is not to be found on any atlas hitherto published, and is unknown to the enterprising followers of Messrs. Cook & Sons. But as the author, Mr. Square, is a native of Flatland, we can consider his account to be as veracious as the descriptions of other remarkable places which have been written by Lemuel Gulliver. The peculiarity of Flatland is that everything in it is absolutely deficient of a third dimension. There are only two dimensions. Men, women, cattle, trees, houses, are, like the subjects of Euclid's six books, either lines or surfaces. Mr. Square tells us—and we have no reason to doubt his statement—that statesmen in Flatland are circles, professors are squares, tradesmen are triangles (the equilateral being considered the most respectable), soldiers are isosceles triangles, each having a narrow base and sharp apex. Pope says that most women have no character at all, and the Flatland ladies are only straight lines. There is, however, compensation in everything, and, by the peculiarity of their organisation, they are made most dangerous to the men, for whether seen in front or from behind, they are so attenuated that their fellow-citizens are wounded before they are aware of the presence of danger. To prevent accidents, all kinds of wise precautions have to be taken against womankind. Two doors are made to the houses, a large one for the men, a narrow one for the women; extremely small rooms are also provided for the latter, in order that their male friends may be comparatively safe. In the houses there are many peculiarities besides doors. Flatland architects are great in planning, and it is a pity that one of them was not induced to study the conditions of the competition for the Admiralty and War Offices. We do not suppose that the contest would attract the least eminent practitioner in Flatland, but some of the younger members might have been inspired to send over a few suggestions. Considering that in Flatland it is impossible to see the shape of anyone, for as one's self and one's friends would be both on one plane, each must seem only as straight lines to the other, whatever be their normal form. May we not therefore conclude that the author can only have discovered the appearance of his neighbours by a philosophical course of experience, that is, by having in the jostling of life had to feel (for length and breadth can surely have feelings) their various sides and angles? If, however, we admit the test of experience we might be tempted to say that Mr. Square is not so impartial as he professes to be, and his statement that the female sex consists of straight lines, dangerously acute at each end, is probably evidence that Mr. Square is rather advanced in years, and has been jilted more than once. Unless mathematical truth, as it is expounded in Cambridge, does not hold in Flatland, we see no reason why the women should not be described as ellipses instead of lines. They would thus be more perfect than the circular statesmen who have but one centre to their being, whereas an elliptical woman would have two foci and an endless variety of outline. Beings may shrink with age in Flatland as elsewhere, and although Mr. Square probably was constituted of honest right angles when he was young, his sides may have since become concave, his angles more acute, and who knows if he has not reached the formation of a cross? In that case he is, when at home, no doubt more than a match for his wife, offering four dangerous points to her two. We might even go so far as to say that the origin of the narrow doors in the Flatland houses arose from the necessity of giving facility for the escape of women when pursued by their irate lords. But we speak under correction, and shall be glad to hear what Mr. Square has to say on this subject. Mr. Square is also a traveller, and has visited Lineland, a country which consists of a straight line. The inhabitants are also straight lines of various dimensions, moving backwards and forwards in their linear world. Mr. Square relates how, on one occasion, he frightened the King of Lineland by his appearance. No inhabitant of Lineland could conceive, far less explain, the existence of such a form; there was no word in their language to express a surface, the idea of two dimensions being absolutely foreign to their nature. Spaceland, the land in which we live (consult Stieler's atlas), was also visited. Mr. Square cannot by any effort of his intellect comprehend the third dimension which forms solids, and therefore he labours under some difficulty in travelling among us. But our land appeared to him like some dream of light, of a brilliancy surpassingly great and magnificent, but inexpressible. The encomiums of a man of his experience are flattering. Nevertheless, he has no doubt the reality of Spaceland. When he was pro-

fessor of mathematics in Flatland Mr. Square taught that quantities exist not only in their first or second powers, which are accounted for by lines and surfaces, but that they can be elevated to an infinity of powers. Therefore, although he cannot conceive anything beyond surfaces to represent mathematical results, yet he cannot resist the conclusion that there are other dimensions, other worlds, other realities besides those his brain is capable of comprehending. His speculations on mathematics are accordingly far more notable than those of Sir William Rowan Hamilton when he predicted the form which objects must assume when seen through a mineral of a certain form. There are readers who may hesitate to accept everything that is said by Mr. Square, especially if they only once read his book. Hamlet tells us there are more things in heaven and earth than are dreamt of in our philosophy, but while we repeat the lines glibly we hardly accept them as words of wisdom. The inhabitants of Flatland, in spite of their good sense, may likewise hesitate in believing all Mr. Square can tell them about ourselves. Meanwhile we recommend all our friends to read "Flatland." They will find in it as limitless fields for their thoughts as in Carlyle's "Sartor Resartus," with the great advantage that "Flatland" is written in good English instead of debased German.

## LEGAL.

### Queen's Bench Division.

(Before Mr. JUSTICE DENMAN, without a Jury).

PLIMSAUL v. LORD KILMOREY.

#### PAYMENT FOR QUANTITIES.

This action involved the question whether a quantity surveyor employed by an architect is entitled to be paid for his services by the building owner for whom the architect is acting, or whether his claim is against the architect alone. Lord Kilmorey engaged Mr. Thomas Verity in 1878 as an architect to direct alterations in the St. James's Theatre, of which his lordship was the owner. Upon the recommendation of Mr. Verity, a Mr. Bradwell was entrusted with the work as builder. There was no written contract between the parties, and as the work proceeded the defendant made payments from time to time to Bradwell of amounts certified by his architect. In July 1879, Mr. Verity retained the plaintiff, as quantity surveyor, to measure up all the work which had been done upon the theatre for the purpose of a final settlement of accounts with the defendant, and the plaintiff now sued the defendant for 187*l.*, the amount of his charges at the usual rate of 2½ per cent. upon the value of the work executed and certified by him. The architect had appended the plaintiff's charges to the builder's account, and forwarded the latter to the defendant, who, however, had refused to pay it upon the ground that the sums claimed by Bradwell were excessive. An action brought by Bradwell for the amounts so charged was referred to Mr. Dowdeswell, the official referee, who considerably reduced Bradwell's claim. In that action the amount of the plaintiff's charges was included in the claim against the defendant, but was disallowed by the referee. The plaintiff now contended that, by a general usage or practice of the building trade, an architect is authorised to employ a quantity surveyor to measure up the work which has been executed for the purpose of a final certificate. That his commission is charged in the builder's account, and on payment to the builder the amount is handed by the latter to the surveyor. This usage was deposed to by the plaintiff, Mr. Verity, and a Mr. Nixon, a quantity surveyor of large experience. It appeared, however, that previous to the retainer of the plaintiff, which was upon July 9, 1879, there had been communications between Mr. Verity and Mr. Maddox, the defendant's solicitor, in the course of which dissatisfaction on the part of the defendant with the builder's charges and the amounts certified by the architect was expressed. Mr. Maddox conveyed to Mr. Verity the intimation that the defendant intended to have the work measured by an independent surveyor, to close accounts with the architect and builder, and to take the work out of their hands. Upon July 5, 1879, Mr. Verity in a letter to the defendant's solicitor said that as the defendant had questioned the charges which he had certified for, it would be well that his surveyor should go over the works with those appointed by his lordship. Further, that he should charge to the defendant all the expenses he might incur in vindicating the correctness of the accounts. In cross-examination Mr. Verity said, his attention being directed to the above passages, that by his surveyor he meant the plaintiff. Mr. Nixon, in answer to a question put by the learned Judge, stated that where a dispute had arisen between a building owner on one side and his architect and builder on the other, it would make a difference in the operation of the custom above noticed.

Mr. Justice Denman, in giving judgment at the close of the plaintiff's case, said that with respect to the general usage of which evidence had been offered, he thought a jury would hesitate to establish it. There were good grounds for considering it unreasonable as applied to circumstances such as were presented in this case, and it must often prejudice a building owner. Whatever

the validity of the custom, the evidence with regard to it was displaced by Mr. Verity's letter of July 5, which made it apparent that he employed the plaintiff as his own surveyor, in view of the differences which had arisen between him and the defendant. This was made more clear by the intimation that he would charge the defendant for the expenses which he might incur—alluding to the charges which the surveyor would make for measurement.

Judgment was accordingly given for the defendant with costs.

## CHURCH BUILDING AND RESTORATION.

**Nottingham.**—The chancel of St. Ann's Church has been reopened after enlargement. The work has been carried out by Mr. H. Vickers, builder, of Nottingham, in accordance with the original design of the architect, Mr. R. Clarke, of Nottingham, and the alteration will furnish additional seats for sixty-four members of the choir.

**Nuttall.**—The church of St. Patrick, recently restored, has been reopened. The building consists of a nave of three bays, with north aisle, chancel, west tower, and a porch on the south side of the nave. To this has now been added an organ chamber and vestry on the north side of the chancel. This and other improvements have been executed by Mr. Baines, contractor, of Newark, assisted by Messrs. Thompson. Mr. J. Fowler, of Louth, is the architect.

**Brighouse.**—The memorial-stones of a Wesleyan chapel have been laid. The cost of the building will be about 4,700*l.* Accommodation will be provided for 950 persons. The architect is Mr. Judson, of Bogthorn, Keighley.

**Blackburn.**—The foundation-stone of a Wesleyan Free Church, in Regent Street, Blackburn, has been laid. It will be Gothic in style, and built of brick, with Yorkshire stone dressings. Both church and school are provided in the building, the former fronting to Regent Street, and the latter, which is underneath, being entered from a passage at the left-hand side, having a gate in Regent Street. On the other side there will be another passage between the church and the houses leading to the minister's vestry, which is provided at one end of the building, and near the pulpit rostrum. The church is estimated to hold 520 people, and the school about 300. The building when completed is expected to cost about 1,000*l.* Mr. J. W. Shorrock, 17 Victoria Street, is the architect, and the contractors are Messrs. Fletcher & Bolton, and Mr. Joseph Panter, all of Blackburn.

## SCHOOL BUILDINGS.

**Kidderminster.**—The foundation-stone of a girls' school for St. John's parish has been laid. Besides the new school, alterations in the existing schools are to be made, which will involve a total expenditure of 2,500*l.* The cost of the girls' school will be about 1,400*l.*, and it is being built by Mr. H. Smith from the plans of Mr. Meredith.

**Burslem.**—The memorial-stone of a Congregational hall and schools has been laid. The architect for the new building is Mr. A. R. Wood, of Tunstall, and the builder, Mr. Cook, of Burslem. The interior of the building comprises an assembly-room (56 feet by 36 feet, and 34 feet high), which is surrounded by fourteen class-rooms, all opening out of the assembly-room. There is a gallery at one end of the assembly-room, and a kitchen for tea-meeting purposes, and lavatories are provided. Mr. Jabez Thompson, of Northwich, supplied the terra-cotta, and the Sneyd Colliery Company the bricks.

## NEW BUILDINGS.

**Leeds.**—The St. James's Hall Coffee Palace, Leeds, has been enlarged. The new wing comprises in the basement large provision stores, and on the ground floor a dining hall, 34 feet by 20 feet. The walls have a dado of ornamental glazed faience, and the ceiling is panelled with moulded ribs, with ornamental cornice and deep frieze. Adjoining is an entrance from York Street, from which a stone staircase leads to the top of the building. A further entrance is provided from the cross street with stone stairs giving access to the basement and the upper rooms. The present dining-room will be enlarged. On the first floor are a ladies' coffee-room, a committee-room, retiring-rooms and lavatory. The new orchestra in connection with the existing lecture hall provides sitting accommodation for 150 persons. The second and third floors are utilised almost entirely for bedroom accommodation. The top-most floor is used entirely for the kitchen department. The new wing harmonises with the existing structure, so far as the leading lines and general grouping are concerned; but it is in a later phase of Gothic, with some Flemish characteristics. The building has been erected from the designs and under the superintendence of Mr. William H. Thorp, Leeds. The contractors were Messrs. Franks and Evans, Leeds; the total outlay will reach 6,000*l.*

## SANITARY WORKS.

**Pontefract.**—The Corporation of Pontefract have just completed the whole of the drainage scheme, extending throughout the borough, at a cost of about 20,000*l*. The works have been carried out by the contractor, Mr. John Simpson, of Hunslet, Leeds. The outfall works are situate about two miles from the town. Since the works were completed the Corporation have had to repave or macadamise every street in the borough, and this undertaking fast approaches completion. Trees have also been planted on either side of the street leading to the Castle grounds, and other street improvements carried out.

## WORKS IN PROGRESS.

**Messrs. Archibald Smith & Stevens**, of Queen's Road, Battersea, have been instructed to erect for Messrs. Spiers & Pond, at the Windmill Restaurant, Cannon Street, one of Stevens & Major's patent hydraulic suspended lifts, to be worked in connection with the Hydraulic Power Company's mains.

**Sewerage Works, &c.**—The Kettering Local Board have accepted the tender of Messrs. Arthur D. Studd & Co., of Kettering, engineers and founders, for the supply and erection of machinery. The system to be adopted is that of mixing the sewage with a proportion of lime in circular stirrers, and then passing it through a series of filter beds or tanks, finally discharging into a running stream as clear water, the residuum being collected periodically from the filter beds or tanks, which are in duplicate, one set being used while the others are cleaned out.

**Ventilation of Public Buildings.**—Messrs. Robert Boyle & Son, 64 Holborn Viaduct, and Bothwell Street, Glasgow, have applied, and are at present applying, their system of ventilation and Self-Acting Air-Pump Ventilators to St. Mary Redcliffe, Bristol, under the direction of Mr. Arthur W. Blomfield, architect; Christ's Hospital (Bluecoat School, second application); Bank of England, Liverpool; Reform Club, Liverpool; Public Hospital, Liverpool; District Hospital, Somerset; Town Hall, Sandwich; Beckett Hospital, Barnsley; National Schools, Stratford-on-Avon; "Laranstein," near Arnheim, Holland; Shorncliffe Camp of the Royal Engineers; Lambeth Carlton Club, Brixton; Grand Pump-Room, Bath; St. Owen's Parish Hall, Jersey; St. Lawrence Parish Hall, Jersey; Bishop Lightfoot's Institute, Bishop Auckland; Maidenhead Town Hall; Royal Infirmary, Naval Schools, Greenwich; Town Hall and Police Court, Dudley; Jewish Working Men's Club, Whitechapel; Devonshire Hospital, Buxton; Bilston Town Hall; Malton Theatre; Llandudno New Board Schools; Post Office, Chesterfield; Union Workhouse, Chesterfield; Inland Revenue Offices, Lincoln; Devon and Exeter Hospital, Exeter; Stroud Union Workhouse; Council-Chamber, Keighley; New Police-Station, Wandsworth; Council-House, Birmingham; Smallpox and Fever Hospital, Birmingham.

## GENERAL.

**The Competitive Designs** for the national memorial of Gambetta (the second competition) will be on view at the Salle Melpomène, Ecole des Beaux-Arts, Paris, from to-day until next Thursday.

**The Exhibition of Incoherent Arts** has been financially successful. The receipts having been sufficient to cover expenses, the returns henceforth will be nearly profits for the fund.

**An Exhibition of Designs** by the late Gustave Doré has been opened in the Boulevard Saint-Germain, Paris. They are selected from the large number produced by the artist for illustrated books. The contents of Doré's studio will shortly be sold by auction. Among them are designs for a proposed edition of Shakespeare.

**M. Fraikin** has nearly completed the statue of Leopold I., which is to be placed in the Chamber of Representatives, Brussels. It is a reproduction on a larger scale of a statue of the King which stood above the President's bureau in the Palais de la Nation before the building was destroyed.

**The Administrative Council of Fine Arts for Paris** is to be constituted as follows:—The Prefect of the Seine; the president of the Municipal Council; M. Alphand; M. Renaud, chief inspector of the Beaux-Arts; MM. Hattat, Collin, Cernesson, Vauthier, Boll, and Delhomme, municipal councillors; MM. Hébert, Jean-Paul Laurens, and Lavastre, painters; MM. Fauguère, Dalou, and Crauk, sculptors; MM. Bailly, Ballu, and Lisch, architects; M. Bracquemond, engraver; M. Chaplain, medallist; and M. Liouville, former member of the jury of sculpture.

**The Rector of Wychling Church** makes an appeal for funds to rebuild the church, which last Easter, he writes, fell into a complete ruin and was closed, and now the chief walls of the building have been condemned as unsafe, and must be rebuilt, considerably increasing the expense. During the last four years the amount raised in response to some nine thousand personal letters only realised 800*l*. The estimate of cost is 2,000*l*.

**The Royal Society of Painters in Water-Colours** have elected Messrs. William Collingwood and R. Thorne Waite to be members.

**The late Sir Erasmus Wilson** has bequeathed to the South Kensington Museum (after the death of Lady Wilson) three paintings, viz., a sea piece by Salvator Rosa, a cattle piece by Sidney Cooper, R.A., and *A Hurricane in the Bay of Biscay*, by E. W. Cooke, R.A.

**Dr. E. Rowand Anderson** has been nominated grand architect to the Grand Lodge of Scotland.
